tomas from pressure by a Murphy button may predispose to ulceration but can scarcely induce it alone in the absence of hyperacidity

The Schick Reaction in Prophylaxis—Armand-Delille and Marie found 37 5 per cent positive reactions to the Schick test for susceptibility to diphtheria in 200 children in various orphan asylums This and similar experiences suggest, they say, the advisability of applying the Schick test regularly to children on entering school, recording the response on each child's card, and also applying the test to new recruits entering the barracks

Bulletin Medical, Paris

June 16 26 1920 34 Nos 31 33

Arsphenamin by Subcutaneous Injection Emery and Morin —p 549
Advantages of Kaolin in Diarrhea R Guillermin —p 551
Mongolism F Apert —p 563
*Uterine Fibromas A Cauchoix —p 581
Conservative Surgery for Uterine Fibromas J Okinczyc —p 585
*Roentgen Ray Treatment of Fibromas J Belot —p 589
*Radium Treatment of Fibromas J Gagey —p 592

Uterine Fibromas—The issue of the *Bulletin* for June 26, No 33, is devoted entirely to uterine fibromas Cauchoix reviews the indications for and against the various methods of treatment, saying that Menard has recently reported three cases in which conception occurred during roentgen-ray treatment of fibromas, with normal course and termination of the pregnancy, confirming Stern s statement that raying the ovaries does not prevent pregnancy later Before radiotherapy in any form is applied thorough examination is necessary, as it is liable to whip up beginning necrosis or malignant degeneration Begouin has reported a fatal case of activation of incipient necrosis Concomitant lesions elsewhere in the uterus or adnexa were found by Fredet in fifty-three of his 121 fibroma cases and by Baudet in fifty-seven of 130 In all cases of fibroma signs of myocarditis should be sought, and this decides the indications for treatment Toxic insufficiency of the kidneys is comparatively common with fibromas the indications with this are the same as with heart disease

Roentgen-Ray Treatment of Uterine Fibromyomas—Belot states that Foveau de Courmelles was the pioneer in this method of treatment publishing his results in January 1904 The statistics from various countries cited by Belot show that the mortality after surgical intervention for uterine fibromas is a little higher than the number of cases which prove refractory to radiotherapy From 95 to 96 per cent of cures can be counted on with the latter He declares that there is no evidence that raying can transform a fibroma into a cancer while on the other hand there is constantly accumulating evidence that radiotherapy may cure cancer of the uterus As Delbet expresses it 'The fibroma, fleeing from the knife melts away under the rays from the roentgen tube

Radium Treatment of Uterine Fibromas—Gagey extols the superiority of radium for treatment of small fibromas not larger than the ovum of a three or four months' pregnancy This is the special field for radium He adds that unless there is latent adnexitis which might flare up radium treatment is absolutely harmless

July 10 1920 34 No 35

*Alimentary Anaphylaxis G Laroche C Richet Jr and F Saint Girons —p 625
Vomiting of Infants J Genevrier —p 629

Alimentary Anaphylaxis—Richet and his co-workers have apparently recently demonstrated by humoral reactions the anaphylactic origin of certain cases of chronic gastroenteritis From the clinical standpoint loss of flesh is an important symptom of alimentary anaphylaxis, but as this occurs with ordinary dyspepsia it does not aid in differentiating It is possible that the two are usually combined, this hypothesis seems to be sustained by the infants who are unable to digest any kind of milk but thrive on change to other food and develop acute gastro-intestinal disturbance anew on return to milk regardless of the small amount ingested Every pediatrician has seen such cases, they seem to testify to a sensitization which is the main characteristic of anaphylaxis It has cleared up the matter considerably to substitute the term "alimentary anaphylaxis" for the vague terms "idiosyncrasy" and "digestive intolerance" as the former has well defined experimental and biologic criteria in acute and in certain cases of minor anaphylaxis and we may soon discover such for dissociated hereditary and chronic anaphylaxis Even without them we are reaping a harvest by discovering and dropping the toxic article of food and then overcoming the extra susceptibility by training the digestive tract to bear such substances without harm The most convenient method for this is to take 0 5 gm of peptone an hour before meals In children the pancreatic ferment plus pepsin may be required as the pancreatic ferment seems to be the only one of the digestive juices which transforms albumin and annuls its anaphylaxis-producing properties In Nathan's case of intolerance for eggs, the stools revealed insufficiency of pancreas function and under pancreas treatment the boy could eat eggs but the anaphylaxis reappeared whenever the organotherapy was suspended A dose of 5 mg of quinin plus 0 5 gm of sodium bicarbonate taken an hour before the ordinary dose of quinin, may banish completely an "idiosyncrasy' to quinin, preventing effectual treatment of malaria

Hyperhidrosis After Shell Shock L Boudon and A Rouquier —p 732
Posterior Tibiofemoral Reflex in Sciatica G Guillain and J A Barre —p 737

Treatment of Jaundice—Weil reported in 1915 his success in treating typhoid with a solution of sugar, plus epinephrin given by the drop method His experience since with it has been favorable in all infectious diseases with the exception of dysentery But his success he says has been most brilliant with this method in catarrhal and toxic jaundice For this he uses a liter of tepid water containing 45 gm of sugar and 1 5 gm of hexamethylenamin The diuresis increases at once by the fourth day reaching usually 3 liters and keeping at 3 or 4 liters while the treatment is continued The jaundice disappears and the pruritus, but the bradycardia is seldom and not much influenced This treatment is often effectual also in jaundice from gallstones sometimes rendering operative measures unnecessary

Autoserotherapy in Urticaria, Hay-Fever, etc—Achard and Flandin state that in conditions in which the factor of anaphylaxis is evident, the serum acquires what they call cryptotoxic properties, and can be utilized to desensitize They give it in minute doses below the level of those inducing shock or even the hemoclasic crisis injecting subcutaneously 0 5 c c of the autoserum, twelve hours later, 1 c c and the next day 1 or 2 c c , 2 c c the following day, and then every second or third day Recurring urticaria, angioneurotic edema and hay-fever yielded promptly to this treatment, but little effect was apparent in asthma Their experience with hay-fever has been limited but one case cured in 1918 had only very slight symptoms the following year The effect of this treatment is not like that of ordinary serotherapy but seems to be an actual desensitization

May 10 1920 129, No 9

*Peptic Jejunal Ulcer A Delore —p 381
Associations of Drugs B Lyonnet and R Boulud —p 417

Peptic Ulcer—Delore refers to peptic ulcers after a gastro-enterostomy and says that he has had three cases in which all errors in technic can be confidently excluded He remarks that gastric ulcer frequently coincides with tuberculosis, in one of his cases, the resected gastric ulcer and

the recurring ulcer in the stomach were both of tuberculous nature, and the patient succumbed to pulmonary tuberculosis not long afterward This is another argument he says, in favor of resection of gastric ulcer As the peptic ulcer is liable to perforate into the peritoneum at any moment, no time should be wasted on medical measures

June 16 1920, **28**, No 40

*Practical Interest of Stercobilin M Brule and H Garban —p 393
*Urea in Spinal Fluid in Epilepsy G Laures and E Gascard —p 396

June 19 1920 **28**, No 41

Inaugural Lecture of Surgical Pathology Course A Gosset — p 401

Elements of the Bile in Estimation of Liver Functioning—Brule and Garban deny the enterohepatic theory of urobilinuria sustained by Labbe and Carrie (See recent abstract July 24, page 277) They claim that with complete arrest of the passage of bile into the bowel the bilirubin in the blood may become transformed into urobilin This may pass into the urine without the participation of the bowel in any respect and thus without the presence of stercobilin in the feces or only in small amounts not commensurate with the intensity of the urobilinuria and irregularly, not paralleling the latter The presence of stercobilin in these conditions does not testify that the bile is passing directly into the bowel It may be shut off completely by obstruction of the biliary passages or some lesion in the liver, and yet stercobilin may pass through the mucosa into the feces Elimination of the bile pigments is difficult to measure and interpret and it is more instructive to study the excretion of the bile salts This can be readily estimated by the blood dust, two or three hours after a meal

Urea Content of Spinal Fluid in Epilepsy—Laures and Gascard tabulate the findings in six epileptics during an epileptic seizure and also during the intervals also in six men with pronounced hysteria, and in two with what has been called hystero epilepsy which later proved to be merely abortive epilepsy The figures cited show a marked rise in the urea content of the cerebrospinal fluid during an epileptic seizure and a marked drop in the urea content in an attack of hysteria The chlorid content did not show any variation in either group

June 23 1920 **28**, No 42

*Sheath Forming Osteitis L Renon and E Geraudel —p 413
Abuse of Subcutaneous Injections of Camphor L Cheinisse —p 416

Sheath-Forming Osteitis—Renon and Geraudel give radiograms from a case of what is usually called Marie's hypertrophic pulmonary osteo-arthropathy This latter term is misleading as only the shafts of the bones are involved the joints being spared The photomicrograms show a double process in the bones the production of a sheath of spongy new bone and calcification of the intercellular fibrillar and interfibrillar substances In the case reported in detail all the long bones were thus ensheathed, the whole apparently coming on in the course of six or seven months in a man of 66 with chronic pneumonia complicated with cancer of the lung They have found five similar cases on record The bones contain more fat than usual but the calcium and magnesium content seemed to be normal Radioscopy shows the essentially irregular bone sheath and in all the cases on record the connection with disease of the lung was unmistakable but hippocratic fingers do not belong to this type

June 26 1920 **28** No 43

*Treatment of Stenosis of the Esophagus J Guisez —p 421
The Oscillometer Ratio E May —p 423
Protective Inoculation against Influenza P Pagniez —p 426

Stenosis of the Esophagus—Guisez concludes his illustrated article with the statement that endoscopy alone generally suffices to restore the permeability of the esophagus even when the stenosis is so complete that the patient is unable to swallow fluids including his own saliva Passage of a filiform bougie under direct visual control is the key to the whole wider and wider bougies being used If this fails gastrotomy is imperative this alone, by resting the esophagus may later allow the passage of the filiform He warns that it is useless to try to introduce the filiform from below if it cannot be introduced from above under the endoscope If this does not succeed then the esophagus is absolutely impermeable as proved to be the case in two of his 135 cases of grave stenosis

The Oscillometer Ratio of the Blood Pressure—The Pachon oscillometer imparts useful information by the amplitude of its oscillations but this oscillometer index is the result of several factors Dividing this index by the difference between the maximal and the minimal pressure, gives what May calls the oscillometer ratio This records exclusively the vascular elements in the pulse, and is thus very instructive in certain conditions

June 30 1920 **28** No 44

*Technic for Gastrectomy T de Martel —p 433
The Oscillometer Index in Asthenia and Mania R Benon and M Leinberger —p 436

Gastrectomy—De Martel places the patient with the upper part of the trunk horizontal the rest of the body sloping at an angle of 45 degrees His incision is on the median line, from xiphoid appendix to umbilicus If this is not enough he continues it horizontally to the right this L allowing ample access to the pyloric end of the stomach, gallbladder etc The special instrument he uses clamps the entire width of the stomach the pressure intensified by a vise device The suturing can be done through lengthwise slits in the clamp He prepares the patient by having the teeth put in order and daily lavage of the stomach to accustom him to the stomach tube after the operation The article is profusely illustrated

Electrocoagulation of Bladder Papillomas F Suter —p 529

Neurotomy for Trigeminal Neuralgia—Perret's illustrated description is of the case of a man of 70 who had suffered agonies from trigeminal neuralgia for twenty years with intervals of transient relief from injection of alcohol and other measures Perret finally cured it completely by severing the nerve back of the gasserian ganglion This isolated

the ganglion by the ascending degeneration of the centripetal fibers of the sensory root, but it left intact the nerve ramification passing from the cavernous plexus to the gasserian ganglion, and also the ophthalmic nerve Hence there was no danger of neuroparalytic keratitis The cure has been complete during the three and a half years to date

Anastomosis of Nerves for Facial Paralysis—Perret and Kummer each gives illustrations of a successful case of the kind in a young woman

Roentgen-Ray Treatment of Surgical Tuberculosis—Iselin analyzes the experiences at Basel 1907-1914 with 1,133 cases They confirm the possibilities of conservative treatment, especially the extraordinarily favorable prognosis under roentgen-ray treatment It is useful as an adjuvant to operative measures Iselin emphasizes that he is a surgeon not a radiologist, but he regards well planned roentgen-ray treatment as a fine foundation for conservative treatment Old tuberculous processes yield earlier and more completely to the rays than young and active ones The efficacy of the rays is seen particularly in the disappearance of tuberculous lesions in glands, omentum, soft parts and joints of many years' standing, and by the reduction of the virulence of the pus from abscesses in experimental lesions The ambulatory treatment and the noninterference with the earning capacity compensate for the length of the course

Gaseous Antisepsis—Steinmann asserts that his apparatus allows a constant stream of oxygen plain or medicated to play on the suppurating tissues or a jet of air passed through chloroform or other antiseptic He says that the jet of air passed through chloroform killed lice nits, bacteria, and even anthrax spores in three minutes

Reconstruction of Larynx and Trachea—Henschen's long article concludes with the assertion that the surgeon with even the technic now available is able to restore the permeability of the trachea and larynx in a most satisfactory manner in the majority of cases, either by a plastic covering or enlarging operation total plastic operation or complete reconstruction of the larynx and trachea He gives a page of plates showing the means for plastic reconstruction of the constricted or obliterated larynx and trachea

Resection of the Vagus in Stomach Affections—Bircher presents evidence to sustain the importance of the neurotic factor in stomach disturbances and especially in the development of gastric ulcer A gastric neurosis alone without anatomic findings may simulate completely the picture of a gastric ulcer When the stomach has been opened up in such a case and no anatomic lesion discovered, surgeons usually conclude the intervention with gastro-enterostomy and let it go at that But with a sagging stomach the gastro-enterostomy may entail more serious disturbances than ever even without the so-called vicious circle, and Bircher thinks it is more logical to resect the vagus fibers innervating the body of the stomach and the pylorus region This will eliminate the neurotic element just as we influence exophthalmic goiter by resecting the thyroid He tabulates the details of eleven cases in which he has done this with surprisingly favorable and permanent results It arrests hypersecretion and pylorospasm and the motor functioning returns to approximate normal He has been surprised to find further that ptosis and atony also subsided The conception of vagotony has been rather discredited of late but his experiences have strengthened the conception anew The cardia is not molested as disturbances in this region are rare, but three or four fibers of the vagus on the upper margin of the lesser curvature are isolated torn out both distally and proximally, and cut across He reaches the fibers on the posterior wall of the stomach through the greater omentum between the stomach and colon thus exposing the whole rear of the stomach and removes in the same way the fibers entering the fundus In one case the vagus resection was done for recurring vomiting but as a rule the indications were excessive secretion or peristalsis

*Tests for Glycuronic Acid in the Urine G Sabatini—p 149
*Clinical Significance of Glycuronuria G Lorenzani—p 174
*Elimination of Chlorids in Fevers G Marcialis—p 184 Conclusion

Tests for Glycuronic Acid in the Urine—Sabatani tabulates the findings with different tests in 141 applications in sixty-eight persons healthy, tuberculous, or with various other grave diseases Fever did not seem to influence the findings, but the diet modified them Administration of camphor elicited a positive response with the naphthoresorcin test but not with the alphanaphthol test, confirming the diverse significance of these tests He commends his modification of the latter test

Significance of Glycuronuria—Lorenzani remarks that colorimetry is reliable enough for estimation of glycuronuria He found it more pronounced the greater the accumulation of toxic matters in the organism In seven typhoid patients with diarrhea the range was from 0 018 to 0 0955, while in seven typhoid cases of the constipated type, the range was from 0 072 to 0 3574

Elimination of Chlorids in Fever—Marcialis concludes his long study of this subject with the statement that the retention of chlorids in fever seems to be a defensive process, so that the chlorids may attenuate the toxicity of the poisons in the blood stream Sodium chlorid by the mouth never induced fever in adults in his experiments

Hydatid Cyst in Kidney Grows Through Diaphragm Pietri—p 121
*Exophthalmic Goiter B Schiassi—p 126
*Unusual Case of Renal Calculus G Vito Tardo—p 145

Exophthalmic Goiter—Schiassi presents charts showing the vicious circle set up by abnormal conditions in the cerebellum, sympathetic nervous system and the thyroid, which finally involves other ductless organs But he explains that in true exophthalmic goiter the thyroid is primarily affected, the disturbance in the secretion leads to toxemia which may prove fatal unless the vicious circle is broken up in time When the thyroid is only secondarily involved, the disturbance is never so severe With this latter form there may be periods of health alternating with periods of symptoms over many years but they never prove fatal This is the type of cases that are called *formes frustes* of exophthalmic goiter, but this is a misnomer, it is not an abortive form but merely presents a few of the symptoms An instructive instance cited to show the interrelations between the endocrine glands is that of a physician who injured the thyroid by running into a clothesline in the dark The swelling and pain in the thyroid and palpitations were accompanied by swelling and pain in the testicles, and priapism Sexual excitement was accompanied by pain in both testicles and the thyroid

Renal Calculus—Tardo gives illustrations of a renal calculus which weighed 804 gm. There had been pain in the kidney at times from early childhood but nephrectomy did not become necessary till the age of 38.

*Congenital Fragility of the Bones G Frontali—p 257

Congenital Fragility of the Bones.—Frontali's article is accompanied with a number of colored plates and other illustrations of a case of pure fragilitas ossium in which the long bones were composed entirely of spongy tissue without any compact bone. The spongiosa showed the embryonal type, without lamellae or haversian system. The number of osteoblasts was below normal but the lower layer of the periosteum was calcified, and cast a shadow simulating that of compact bone. The calcium balance and calcium content of the blood were normal, and the infant looked well nourished when it died at the age of 3½ months. There were evidences of thirty-three fractures and the thymus presented extreme atrophy and sclerosis but the other endocrine glands seemed normal. He urges examination of the thymus in all cases of fragility of the bones with thymus treatment possibly by injection of serum from children with a functionally capable thymus. He adds an extensive bibliography on the subject, comparing his case with those on record.

Language and Speech L D Espejo—p 173 Cont'n
Reactions that Distinguish Balsam of Peru from Other Balsams M A Velasquez and A Maldonado—p 207

Measles Versus Rubeola—Arce reports a few cases which show that the mononucleosis which some regard as pathognomonic of rubeola may be absent and in its place may be found an ordinary polynuclear leukocytosis which is generally assumed to be typical of measles. When both measles and rubeola are epidemic as has been the case recently at Lima, there do not seem to be any reliable features to differentiate them, not even Koplik's spots are dependable. The only symptom which he found exclusively in rubeola was the swelling of the epitrochlear lymph nodes. These nodes rarely enlarge with general infections and Lesieur and Jacquet have called attention to this adenopathy as characteristic of rubeola. He has never found the glands enlarged except in rubeola and in Peruvian verruca. This polyadenitis is one of the earliest signs of this latter disease. The postcervical lymph nodes may enlarge in rubeola, this was he case in some of his patients, the swollen and painful gland as large as a chick-pea.

Sudden Deaths—Quesada's article is a review of a large number of sudden deaths most of them the result of congestion of the lung in alcohol addicts at the onset of cold weather. The other cases were mostly due to heart failure with chronic heart and kidney disease or to hemorrhagic malaria. He comments on the remarkable preponderance of the unmarried in these cases of sudden death and the very small proportion of women among them. The ages from 40 to 49 and from 60 to 69 seem to be the most predisposed to sudden death, nearly all the subjects were working men.

*Untoward By-Effects from Treatment with Tartrate of Antimony and Potassium I R Risquez—p 74
Sagging Spleen Simulating Ovarian Tumor Splenectomy L Razetti—p 75

By-Effects from Tartrate of Antimony and Potassium—Risquez reports that the patient was apparently doing well under a systematic course of treatment with tartar emetic for bilharziasis when suddenly after injection of 0.09 gm. of the drug he developed chills and contractures and pains in the muscles. The chill, intense tremor and the aspect were like those of severe malaria and the temperature ran up to 104 F. with vomiting but under repose, rubbing with camphorated oil and hot drinks a purge and an emetic, he recovered. The pain and soreness of the muscles continued for several days. The patient said he felt as if he had just had a severe illness. By the end of the week he had quite recovered and wanted to go on with the injections.

*Plantar Hyperhidrosis J A Lopez—p 443

Excessive Sweating of the Feet.—Lopez discusses this subject from the military standpoint and his success in curing plantar hyperhidrosis in soldiers with a dusting powder consisting of 60 parts alum to 40 parts talcum powder. This reduced or checked completely the excessive sweating eliminated the bad odor and prevented maceration etc. from the sweat while saving the shoes from the constant moisture. He ascribes the cause of the hyperhidrosis and certain vasomotor phenomena chilblains varices hemorrhoids and similar minor disturbances to some general toxic action and thinks that incipient attenuated tuberculosis is responsible for this in many cases. He says that general treatment by the Argentine method of extremely minute doses of tuberculin may be worth a trial or with Ferran's antialpha sero therapy or vaccine.

*Fever Treatment of Vulvovaginitis in Children Hertha Schulz —p 429
*Age Limits for Spasmophilia E Klose —p 439
Congenital Defect in Parietal Bone H Eckhardt —p 444

Pseudobulbar Paralysis—Dibbelt describes the cases of two children of 6 and 8 with spastic diplegia of a severe form, either congenital or developing soon after birth There were no eye symptoms and the intelligence was normal In the thirteen cases on record with necropsy findings, some defect in the cortex was apparent Treatment must be essentially orthopedic, strengthening the antagonist muscles, with possibly surgical measures for spastic contracture Indefatigable patience and perseverance are indispensable to train other centers to substitute the lacking cortical centers

Thermal Treatment of Vulvovaginitis—Schulz applied to twenty little girls Weiss method of deep hot baths in treatment of gonococcus processes Notwithstanding a few instances of transient benefit, she was obliged to abandon this treatment on account of the by-effects delirium, syncope and even convulsions in some of the children From fifteen to twenty baths were given each for twenty or thirty minutes every day or second day The children complained of violent headache and abdominal pains and fought to climb out of the hot water, from 38 C the temperature was raised to 40 or 44 C (104 or 111 F)

Age Limit for Spasmophilia—Klose argues that it is impossible for spasmophilia to develop in infants less than 2 months old This is the limit below which manifest tetany cannot develop

Postoperative Thrombo-Embolism.—Capelle analyzes 15 cases at Garre's clinic in ten years and 10 000 operations In about a third of the cases the embolism was not diagnosed, an attempt to operate was made in only 2 of the cases and it failed in both In 4 cases operative intervention might have proved successful as there was an interval of from two to seven days before the fatal outcome But in one the warning symptoms were mistaken for pneumonia and in another the symptoms resembled attacks of weakness to which the patient had been subject and he protested against calling the physician In the 2 others the embolism was recognized but as in 2 similar cases the patients had spontaneously recovered, this was anticipated in these cases and nothing was done This disinclination to active intervention was fostered by the fear of a mistake in the diagnosis Erroneous assumption of embolism had been made in 35 per cent of the cases in the course of the ten years Another reason for reframing is that at the second attack the emboli are usually multiple and scattered

He warns that when the pulmonary artery has been incised in search for the embolus the first thing is to relieve the right heart leaving the extraction of the embolus till later He regards as the cause of the fatality in one operative case the neglect to wait for the right heart to obtain relief by pumping out some of the blood through the incision in the artery It might be useful to have the assistant take the heart in his palm and compress with his fingers the region of the mouth of the cava, squeezing the blood out from the heart into the cava, which can stand the dilatation better This manipulation should precede the incision of the pulmonary, and be continued during the entire period of extraction of the embolus This procedure is of great aid in suturing the heart

Conditions in the inferior vena cava at a laparotomy often invite thrombosis and embolism from this is favored by resumption of the normal type of breathing, the ample excursions of the diaphragm after the shallow breathing imposed by the pain in the laparotomy wound This throws light on the date when embolism usually appears Another point which he emphasizes is the possibility that a small thrombus inside the heart may grow to a fatal embolus This would explain the cases in which central ligation of the thrombosed vessel did not prevent embolism, and it is a further argument for the necessity of letting the right heart pump out its contents for a few systoles

Intestinal Polyposis—Muller emphasizes the danger from hemorrhages and diarrhea with this disease, torsion of the polypous growths entailing hemorrhages, and he cites Doering's statement that of the fifty known cases of intestinal polyposis thirty-one terminated in cancerous degeneration The roentgenogram is from his case in a boy of 16, the symptoms first noted a year before The sister, two years old presents a similar clinical picture The boy is of the adipose genital dystrophy type An attempt with radium treatment has been reported from France, with arrest of the diarrhea and considerable retrogression of the polyps Roentgen ray treatment was proposed to Muller's patient, but it was rejected

Induced Blanching of Eruption in Diagnosis of Scarlet Fever—In dealing with doubtful cases of scarlet fever the prompt recognition of which in a large hospital is imperative, Neumann has come to appreciate highly Schulz and Charlton's *Ausloschungsphanomen* which he has been using for the past year Schulz and Charlton found that injections of convalescents serum dispelled the eruption of scarlet fever in the neighborhood of the injection site Only the scarlatinal eruption was thus blotted out, other scarlatiniform or confluent eruptions showed no change following intracutaneous injections of 1 or 0 5 c c of serum Serum from patients at

the height of the disease does not produce this discutient phenomenon, but all other serums, not only convalescents serum but also normal serum and serums from cases of other diseases blotted out the eruption of scarlet fever in the region of the injection Armed with these two positive facts, first that only the eruption of scarlet fever is locally dispelled, and, second, that early scarlet fever serum is the only serum that does not produce the phenomenon, valuable aid for the differential diagnosis of scarlet fever seemed to be established, and such has proved to be the case The local blanching of the eruption appears from six to eight hours following the injection and persists The diagnostic results border on certainty No harm resulted in his 200 injections

Dermatomyositis and Infectious Diseases of Muscles—Von Niedner regards dermatomyositis as a distinct disease entity from the clinical, etiologic and pathologic standpoints and hopes by this account of two fatal cases to awaken the interest of the general practitioner in the rather confusing array of infectious diseases of the muscles All attempts to influence the course of the disease proved futile By bed rest, Karell diet and the use of calomel it was possible to reduce the edema and thus to bring about a temporary improvement in the appetite and the general condition, but no marked influence on the course of the disease was attained The very painful deglutition symptoms were partially relieved by steam from water to which epinephrin had been added so that the patients were able to take sufficient nourishment up to the last The attempt to improve the glycogen content of the muscles by increasing the sugar intake and thus procuring an increased immunity was unsuccessful

Transitory Glycosuria of the Renal Type—Galambos states that so-called renal diabetes is usually regarded as an extremely rare condition However, he is inclined to think that it is not its occurrence but its recognition that is rare He finds less than twenty-five cases reported in the literature To these he adds two cases, the first was in a young man of 28 who had suffered from stomach trouble since he was 12 At the age of 23 he had been operated on for gastric ulcer At the present admission the sugar content of the urine was 0 2 per cent By reduction polarization and fermentation tests the sugar was shown to be glucose Levulose and pentose reactions were negative The glycosuria did not disappear when carbohydrates were withdrawn When the general carbohydrate intake was increased there was no rise of the urinary sugar content When from 130 to 500 gm of carbohydrate were ingested within twenty-four hours sugar excretion was not influenced thereby The amount of sugar excreted within twenty-four hours varied from 0 to 6 gm the average being 3 gm A period with no glycosuria ran parallel to the largest carbohydrate intake (500 gm) Noorden is cited to the effect that in light and especially in recent cases of diabetes mellitus it may occur that the degree of glycosuria is independent of the carbohydrate intake but in renal diabetes this is the rule In renal diabetes, when the kidneys owing to their sensitiveness to sugar, have excreted sugar in the presence of a subnormal or low blood sugar content which is an indication that the renal sugar threshold is lowered, it is not surprising if the glycosuria is increased to correspond to the moderate increase of blood sugar caused by the ingestion of 100 gm of glucose In other words a patient with renal diabetes may react toward glucose in the same manner as a true diabetic or as any other patient with reduced sugar tolerance In the latter cases the increased glycosuria is directly associated with a markedly increased hyperglycemia while in renal diabetes on account of the low renal sugar threshold a very slight rise of the blood sugar content suffices to produce or increase the glycosuria In diabetes mellitus the blood sugar content and the glycosuria are increased not only by the sugar content of the diet but also by the starch and albumin content In renal diabetes only glucose increases the glycosuria and this may be accomplished by a very slight augmentation of the hyperglycemia In Galambos case the glycosuria had subsided and did not return during the last ten days of clinical observation, not even after ingestion of 500 gm of carbohydrate Galambos has been unable to find any analogous cases on record of transient glycosuria of the renal type

Treatment of Dupuytren's Contracture—Momburg finds the radical operation not only laborious but also dangerous on account of the frequent necrosis of the skin flaps He believes that subcutaneous division of all the contracted fascia is the simplest and most effectual method for treating Dupuytren's contracture

Abdominal Actinomycosis—Brandenstein reports a case in a girl of 13 although it rarely occurs in young persons The actinomycosis had evidently developed from a diseased appendix and had given rise to right pyosalpinx Although even approximately radical extirpation of the actinomycotic foci was impossible and although the disease process had extended to the back—both of which circumstances pointed to an unfavorable outcome—yet all the signs of the disease disappeared after the operation and there has been no recurrence during the six months to date

*To Promote Rapid Separation of the Placenta G Sklawunos (Athens)—p 291
*Relations Between Left Adnexa and Sigmoid Flexure H Erdmann—p 301
*Injection of Epinephrin into the Heart Elisabet Heydloff—p 318
*Radiotherapy in 1919 H Wintz—p 331 Concn in No 6 p 415

Injection of Fluid to Aid in Separation of Placenta—Sklawunos injects about 150 c c of hot citrated saline through the umbilical vein into the placenta He cuts off the cord about five fingerbreadths from the vulva to allow blood to flow freely and avert thrombosis The fluid is at a temperature of 50 or 60 C (122 or 140 F) and it flows from a height of 1½ or 2 m above the level of the bed In a minute or two after the fluid enters the vein the two umbilical arteries begin to swell as the blood is forced into them by the pressure from the inflowing fluid The arteries are then clamped and spontaneous expulsion of the placenta awaited The uterus was always found intensely contracted and hard, while there was no bleeding Further advantages were the moderate lochia and the attenuation or abolition of afterpains The hot fluid spreads through the villi and thus acts like a spray on the placental area of the myometrium causing it to contract and checking any tendency to bleed It is possible that toxic products from the fetus accumulated back of the placenta may thus be forced into the circulation and further stimulate the uterus to contract

Connection Between Intestines and Adnexa—Erdmann reports thirteen cases in which the left ovary alone was tender and swollen in the total absence of puerperal septic and gonococcus disease In all there was enteritis in the sigmoid region for which the war diet was probably responsible and in every case the ovaritis subsided under treatment of the pathologic conditions in the bowel

Intracardial Injection of Epinephrin—Heydloff reports that the pulse disappeared suddenly as the placenta was being separated by hand during cesarean section done on account of contracted rachitic pelvis Massage from without had no effect on the pulseless heart and 2 c c of a 1 per cent solution of epinephrin (adrenalin) was injected directly into the heart through the fourth left interspace close to the sternum No effect was apparent and the woman seemed dead but then the incision began to bleed and the heart was found beating rapidly artificial respiration had to be kept up for a time The total arrest of the heart action covered five or six minutes The case was complicated by the fact that

owing to some blunder, two injections of scopolamin-morphin had been given, instead of the routine single injection Artificial respiration and insufflation of oxygen had been continued through the entire operation

Radiotherapy in Germany in 1919—In the course of this critical review, Wintz states that Weibel applied radium as a prophylactic measure in 264 cases after operations for uterine cancer, but found that the intestine and the bladder were injured thereby in so many cases that the method has been abandoned Pranter has reported roentgen ulcer developing in the abdominal wall a year and a half after a course of roentgen-ray treatment for uterine myoma The tardy ulceration followed immediately after sunbaths which suggests, Wintz declares, that regions which have been exposed to the roentgen rays should be considered points of lesser resistance, and be protected thereafter against further injury He adds that Holzknecht has treated 150 cases of "roentgen hands," keratosis, ulcerating epitheliomas, with the roentgen rays, and insists that roentgen keratosis is amenable to treatment by the roentgen rays Depenthal has reported from Cologne the case of a roentgen nurse who developed in 1907 a roentgen carcinoma of the right thumb and part of the left hand, and recently, bilateral roentgen mammary cancer compelled amputation of both breasts This is cited as the first instance known of roentgen-ray carcinoma developing in an organ under intact skin In all the previously reported cases of roentgen cancer, it started in the epidermis and was of the basement epithelium type. Wintz mentions further some instances in which the amount of ozone generated in the roentgen room surpassed the tolerated maximum

*Injections of Alcohol into Gasserian Ganglion H Pichler—p 473
Begun in No 21 p 441

Gastrectomy in Perforating Gastric and Duodenal Ulcer—Schwarzmann states that the radical treatment of gastric ulcer is gaining more and more adherents The less radical methods excision or exclusion of the ulcer, or leaving it untouched are yielding to gastrectomy The ulcer left in the abdominal cavity is often a source of continued pain The dangers of hemorrhage and especially of perforation persist The presence of multiple gastric ulcers and of contact ulcers situated opposite to duodenal ulcers are further evidence of the uncertainty of the excision procedure Exclusion without extensive resection gives uncertain results, to mention only the appearance of peptic ulcers Marked meteorism or a septic condition of the patient may be contraindications to gastrectomy

Injections of Alcohol into the Gasserian Ganglion—Pichler reports that injections of alcohol into the gasserian ganglion can be relied on to cure trigeminal neuralgia in almost every instance However the procedure is by no means simple, but requires much practice It should be used only when all other methods have failed or when the pain is unbearable It usually renders gasserectomy unnecessary Local causes should be searched for and removed A careful examination of the buccal cavity the nose and the eyes is essential in which roentgenography will usually play a part Neuroparalytic keratitis is a common complication Hence the need of a careful examination of both eyes before injections are begun The dose of alcohol required varies greatly Not infrequently ten times or even fifteen times as much may be necessary as Hartel assigns as the maximal dose (1 c c) Peripheral injections and injections at the base of the skull are useless if several branches of the nerve are involved Resection of the second and third branch (Kronlein) is contraindicated because it makes future injections of alcohol more difficult

*Effect on the Blood of Restriction of Fluids V Rubow—p 305

Action on the Blood of Restriction of Intake of Fluid—Rubow ascribes part of the benefit from sweating, augmented diuresis and purges, Karell and similar "cures"—the essential feature of which is a dry diet—to the resulting concentration of the blood Singer's treatment of chronic bronchitis by reducing the intake of fluids is another instance of the advantage that may result with localized infections from reducing the water content of the organism With the Karell cure only 800 gm of milk is allowed, this covers only about a third of the requirement for fluid for the twenty-four hours Rubow found in some cases of ascites given this treatment that the water content of the blood was reduced by 8 10 or even 12 5 per cent in the course of a few days He comments on the neglect of Finsen's recommendation of a dry diet in treatment of ascites, the literature of the last twenty years showing innumerable cases in which cardiac dropsy has been treated with digitalis, strophanthus and strong diuretics, when simple restriction of fluids and less salt in the food might have answered the same purpose in banishing the dropsy Rubow tabulates the findings during the week of the Karell cure in four cases, showing how the ash of the blood increased from 19 2 to 21 95 in one case In a case of nephritic dropsy, the sodium chlorid content of the blood ran up rapidly from 0 529 to 0 665 per cent The diuresis accompanying this he explains as a salt diuresis, like that which can be induced experimentally by rendering the blood transiently hydremic and oversalty by injecting a hypertonic solution of sodium chlorid In one case of ascites, there was no increase in the sodium chlorid content of the blood, and the diuresis did not increase either under the Karell treatment The sodium chlorid absorbed from the hydrops was eliminated exclusively in the urine one day it amounted to 1 54 per cent of the urine The hydrops fluid was eliminated by lungs and skin

STUDIES IN BASAL METABOLISM*

A M SNELL, M D, FRANCES FORD, M D,
AND
L G ROWNTREE, M D
MINNEAPOLIS

Metabolism is the basis of life and of all its phenomena Like Tennyson's "Brook," it goes on forever Species are cast in various molds, generations appear and disappear, youth is followed by maturity and age, yet through it all, running along on predetermined lines, goes metabolism

Protoplasm is not mere matter The cell is the origin of energy, the seat of chemical exchange, of growth, of function and of life The digestion and assimilation of nutriment, reproduction, growth, inflammation, degeneration, regeneration, exercise of function, motion and emotion are all matters of chemistry Species, genus and period of existence are incidents determined by heredity, while size, weight and even personal appearance are matters of metabolism Where life is, metabolism is, and regulating it are the endocrine glands, the glands of internal secretion

By the aid of calorimetry we learn that in health the regulating factors are adjusted or balanced to yield metabolic rates best adapted to energy requirements and to bodily needs Thus, during rest and sleep the energy requirement and output are low and the rate is decreased, but as more energy is demanded, the rate of metabolism increases in proportion to the need The two extraneous factors most commonly and markedly affecting metabolic rates are exercise and food It is necessary, therefore, to adopt for comparative purposes conditions under which these factors are reduced to a minimum The resulting rate, designated the "basal metabolic rate," represents metabolism when the body is at complete rest and when the digestive processes are at their normal daily minimum So perfect is the adjustment in health that under the conditions indicated the basal metabolic rate is found to bear a constant relation to the surface area, the rate thereby becoming mathematically a function of the body surface, while in many diseases metabolism is fundamentally deranged, the basal metabolic rate ranging far above or below normal In the following paragraphs, discussion will center on some of the more important factors affecting the basal metabolic rate

TECHNIC EMPLOYED IN DETERMINING THE BASAL METABOLIC RATE

The development of indirect calorimetry is significantly affecting medical practice The determination of the basal metabolic rate is at present a practical procedure which can be carried out in any well equipped hospital or clinic, at the bedside or in the laboratory The newer methods enable the physician to gather fundamental information concerning the status of the patient's metabolism formerly available only through elaborate studies carried out in special institutions equipped with costly calorimeters and manned by a highly trained personnel

In determining the basal metabolic rate, the gasometer method is employed In our work Tissot's[1] spirometer, with certain modifications introduced by Boothby[2] and Sandiford,[3] has been employed in the collection of air, and in its analysis Haldane's apparatus

Preparation of the Patient—The rate is determined after a fourteen hours' fast, that is, in the morning before breakfast, no food having been taken since the meal of the previous evening Hospital patients are confined to bed and brought to the laboratory on a litter, and after a fifteen to thirty minutes' wait, collection of air is begun Patients from outside, brought in automobiles or street cars, are subjected by routine to from one-half to one hour's rest, preferably lying down, before the collection of air is instituted The patients are instructed to breathe as naturally as possible and to avoid forced expiration in an effort to overcome the slight resistance of the apparatus Patients who are uncomfortable tend to deep and irregular breathing Obese persons and those with marked thyroid enlargement are accorded special attention as to posture, the head being elevated and the patient placed in as comfortable a position as possible Control collections are necessary when uncertainty exists as to the comfort of the patient during the period of collection In nervous and neurasthenic persons, repetition on a subsequent day is also necessary, since not infrequently high rates are encountered in the initial readings

BASAL METABOLIC RATE IN NORMAL PERSONS

Any method to be of value must yield under proper control consistent normal values in normal persons, and

2 In Boothby's modification of Tissot's technic a face mask replaces the nasal tubes Douglas mica valves replace the electrically controlled valves used by Tissot and a steel tape replaces the automatic measuring device of the original apparatus

3 Boothby W M The Clinical Value of Studies of Thyroid Cases Boston M & S J 1919 Boothby W M and Sandiford I Basal Rate Determination Philadelphia W

deviations from normal only when variations actually exist' The basal metabolic rate itself is subject to many and varied influences, while the technic and calculations involved contribute additional possible sources of error From an experience extending over fourteen months and involving approximately 750 determinations on 350 persons, we believe that the method yields results which vary only within narrow limits, which are reliable and consistent, and which are of practical value in following the clinical course of the case

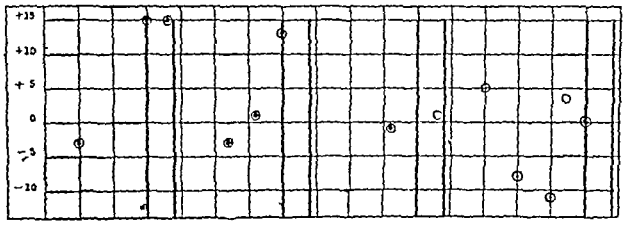

Fig 1—Basal metabolic rates in relation to menstruation The columns represent the menstrual periods

As controls, a group was studied consisting of twenty-eight healthy students and nurses, and persons suffering from minor ailments entirely unassociated with endocrine disturbances (Table 1)

In order further to control the accuracy of the method and the constancy of the basal metabolic rate, a group of normal persons was subjected to repeated observations In twenty-five determinations on nine subjects, the greatest variation found in the rate in an individual case was 10 5 per cent, the average variation being approximately 5 per cent (Table 2)

Effect of Previous Exercise—As a matter of practical importance, it is necessary to ascertain whether or not moderate exercise in the morning just prior to determination affects the rate, since many patients are sent in from the outside for determination of the basal metabolic rate Reliable results can be obtained on outpatients after moderate exercise, provided they are subjected to from one-half to one hour's rest, but without this rest the results are unreliable In order to ascertain the extent to which exercise affects basal metabolism, the rate of several subjects was determined immediately subsequent to moderate exercise, that is, a short walk of 300 yards and the climbing of two flights of stairs, the amount of exercise to which many patients are frequently subjected The changes encountered emphasize the need of careful control in this connection (Table 3)

The Effect of Menstruation—Menstruation, a factor usually neglected, is perhaps of some practical importance *So far as we are aware, it has never been* allotted any consideration in the studies of metabolism But it does affect the basal metabolic rate of women at times in health and in disease To determine the extent of its influence a special investigation has been carried out by one of us (Ford), the details of which will appear shortly in a separate communication. The effect of menstruation can be seen in the chart which represents the findings in a normal student (Fig 1)

A rather constant rise occurs during menstruation or in the premenstrual period, the rise being followed by a postmenstrual fall Ten cases have been studied

TABLE 3—EFFECTS OF EXERCISE ON BASAL METABOLIC RATE

Name	Sex	Previous to Exercise	After Exercise (Immediately)
H B	♀	+5	+63
D D	♀	—8	+43
H P	♀	+1 8	+88
		+1 5	+67
M McL	♀	—2	+32

Of these, two show practically constant rises, and six constant rises, varying from 4 per cent to 14 per cent, the average being 10 per cent, while in two a drop in rate was encountered Values outside normal limits, ± 10, are infrequent

BASAL METABOLISM IN DISEASE

In this connection detailed consideration will be allotted basal metabolism in certain diseases of the endocrine system In our studies hyperthyroidism, febrile diseases and leukemia have exhibited the highest rates, while hypothyroidism, polyglandular deficiencies and afebrile conditions resulting from inanition and marked asthenia have yielded the lowest rates Starvation and prolonged rest in bed tend to result in low rates

DISEASES OF THE THYROID

The thyroid is the principal or chief "regulator of metabolism" Whereas other endocrine glands may be concerned with specific features of metabolism, such as growth, carbohydrate metabolism or water balance, the thyroid affects primarily the metabolic rate, and secondarily perhaps other features

Friedrich Muller [6] and Magnus-Levy [7] were the first to direct our attention to the metabolic changes attending diseases of the thyroid

6 Muller Friedrich Beitrage zur Kenntnis der Basedow schen Krankheit, Deutsch Arch f klin Med 51 335-412 1892 1893

7 Magnus Levy A Ueber den respiratorischen Gaswechsel unter dem Einfluss der Thyreoidea sowie unter verschiedenen pathologischen Zustanden Berl klin Wchnschr 32 650-652 1895 The Physiology of Metabolism in von Noorden K H Metabolism and Practical Medicine Chicago Keener & Co 1, 1907

In the study of various diseases of the thyroid we have found Plummer's [8] classification of the greatest assistance These groups have been recognized

1 Hypothyroidism, (*a*) cretinism, (*b*) myxedema
2 Hyperthyroidism, (*a*) exophthalmic goiter, (*b*) thyrotoxic adenoma
3 Nontoxic enlargements of the thyroid, (*a*) adenoma, nontoxic, (*b*) adolescent goiter, (*c*) colloid goiter

HYPOTHYROIDISM

A group comprising thirteen cases of cretinism and myxedema was investigated from the standpoint of basal metabolism An unusual opportunity for the study of cretinism [9] and juvenile myxedema was afforded through the presence of eight such patients in the State Institution for Feeble-Minded [10] Through the courtesy of the superintendent, these patients were brought to the University Hospital, where they were subjected to an intensive study which included routine physical examination, Wassermann tests, urinalyses, studies of blood chemistry and of basal metabolic rates, roentgenograms, electrocardiograms, anthropological measurements, dental examinations, and physiologic investigations involving determinations of the auditory reaction time and Binet and performance tests The patients' ages varied from 15 to 31 years In all but two cases the objective and subjective manifestations were characteristic (Fig 2 and Table 4) The thyroid could not be palpated in six, while in two (F D and N D, sisters) cystlike tumors about 2 by 3 cm and of fibrous consistency were felt in the region of the isthmus Of the two remaining cretins, one (W R, Fig 3) was typical in every respect, while the other, though mild and atypical clinically, represented the lowest metabolic rate encoutered in the entire series

In the cretins, the metabolic rate varied from —7 to —25 No constant or absolute parallelism between the clinical manifestation and the metabolic rate [11] could be established, although, generally speaking, some agreement existed The striking exception is seen in Case 9, which represents the lowest rate, although the clinical manifestations were mild Whether or not environment plays a role clinically must be considered, since the patient, the child of wealthy parents, had been surrounded since birth with all the comforts and luxuries of life (Table 4)

HYPERTHYROIDISM

Under hyperthyroidism are included exophthalmic goiter and adenoma of the thyroid with hyperthyroidism (thyrotoxic adenoma)

Exophthalmic Goiter (Parry's, Graves', or Basedow's disease) —Although the first description of this disease appeared in 1827, it was not until 1895 that Magnus-Levy called attention to the increased metabolic rate In this country special attention has been given the subject by Means and Aub,[12] Du Bois,[13] Plummer,[8] Boothby and Sandiford,[3] and McCaskey [14]

In our small series comprising thirteen cases, which were all typical clinically, the basal metabolic rate ranged from + 20 to + 82, the rates being approximately proportionate to the clinical evidences of thyroid intoxication Two patients of the series died The patient with the highest rate, + 82, died within a month after single ligation The second patient, rate + 56, did not come to operation, but died of cerebral apoplexy The rates relative to our cases can be seen in Table 5, and the results of treatment in Table 6

Fig 2—Cretinism and juvenile myxedema From left to right back row A H aged 24 I A aged 15 front row C F aged 22 F D aged 15 N D aged 25, W A aged 31

One case was of particular interest, especially in relation to the recent publication of Means and Aub, in which they advocate the use of the roentgen ray in the treatment of exophthalmic goiter The patient, aged 28, presented a small adenoma in association with a diffuse parenchymatous hypertrophy More than a year subsequent to lobectomy, the basal metabolic rate was still abnormally high and did not respond to six weeks' rest in bed and courses of sodium cacodylate A rapid return of the rate to normal, together with marked clinical improvement, followed repeated roent-

9 We are indebted to Dr E C Kendall for the thyroxin used in these studies

10 The details of these investigations will be the subject of a separate report The question might be raised as to whether or not we are correct in accepting the chronological age as the basis of calculation in determining the basal metabolic rate in cretins of advanced age Thus in W A Case 7 the rate is —7 Were we to accept the mental or physical development (2 to 5 years) as the basis of calculation the rate would be lower and more in keeping with the clinical findings

11 An attempt to correlate basal metabolism and mentality utilizing for this purpose standard psychologic measurements would probably reveal most interesting relationships

gen-ray treatments[15] (Fig 4) This case is not presented as an argument for roentgen-ray as against surgical treatment, but it does indicate the desirability of utilizing the roentgen ray when surgical treatment has failed or fallen short of complete restoration to normal

Adenoma of the Thyroid with Hyperthyroidism (thyrotoxic adenoma).—In analyzing our hyperthyroid material we have followed Plummer, who has clearly separated from true exophthalmic goiter accompanied by hyperplasia and hypertrophy of the thyroid a group of cases of adenoma with thyrotoxicosis

Plummer's contention as to the thyrotoxic character of the symptoms encountered in this disease, namely, nervousness, tremor, tachycardia and loss of weight and strength, finds confirmation in the increased metabolic rates encountered in the investigations carried on in the Mayo Clinic by Plummer,[8] Boothby[3] and Sandiford,[16] and in the results of our studies here reported[17]

In our series are eleven cases of thyrotoxic adenoma, three of which exhibited slight but definite exophthalmos The data in relation to our series appear in Table 7, and the results of treatment in Table 8

According to Plummer, in thyrotoxic adenoma the enlargement of the thyroid appears earlier in life, the struma persists, as a rule, for a much longer period before the appearance of thyrotoxic manifestations, exophthalmos develops much less frequently and is less marked, and hypertension is of common occurrence Some cases of this group closely resemble exophthalmic goiter, while in others the cardiovascular phenomena predominate, hypertension playing a great role early in the course of the disease, and myocardial degeneration in its later stages

NONTOXIC ENLARGEMENTS OF THE THYROID

Nontoxic Adenoma.—Adenoma may persist for many years without concomitant toxic manifestations Plummer states that adenomas appear as a rule about the twenty-second year, but that the toxic manifestations do not usually appear until the thirty-sixth year Certainly adenomas may exist for many years with the

15 Our data are too meager to permit an expression of opinion concerning the relative merits of the surgical and the roentgen ray treatment The subject is being investigated in our clinic

16 Sandiford Irene The Basal Metabolic Rate in Exophthalmic Goiter (1917 Cases) with a Brief Description of the Technic Used at the Mayo Clinic Endocrinology 4 71 87 1920 The Effect of the Subcutaneous Injection of Adrenalin Chlorid on the Heat Production Blood Pressure and Pulse Rate in Man Am J Physiol 51 407-422 1920

17 We wish to express our gratitude to Drs Plummer and Boothby and to Miss Sandiford for assistance in the installation of our metabolic laboratory and for many helpful suggestions in regard to technic

entire absence of general symptoms Our study included a series of twenty-two cases, practically all the rates fell within normal limits

Adolescent Goiter —Fourteen girls (a group of university students) presenting adolescent goiter were studied for the basal metabolic rate With two exceptions the rates fell within normal limits In neither of the cases with high rates were there either symptoms or signs of thyroid intoxication

BASAL METABOLISM IN DISEASES OF THE PITUITARY GLAND

The pituitary gland is concerned primarily with phenomena of growth and sex development, and perhaps also with water balance The relation of the pituitary to the basal metabolic rate and to the function of the thyroid in health and disease has not yet been fully determined

Hyperactivity of the anterior lobe occurring in youth results in gigantism, and in adults in acromegaly, while hypo-activity results in infantilism, and when combined with deficiency of anterior lobe hormone, in Frohlich's syndrome or dystrophia adiposogenitalis Hypo-activity of the posterior lobe and pars intermedia gives rise to diabetes insipidus

A group of seven pituitary cases has been studied, including two cases of Frohlich's syndrome and five of primary diabetes insipidus The basal metabolism in these cases and the effect on it of pituitary extract is shown in Table 9

Other instances of pituitary disorders (Frohlich's syndrome and acromegaly) have been encountered showing marked disturbances of the metabolic rate These will be reported later

From the data here represented it is evident that no profound or lasting effect on basal metabolism has resulted from the administration of desiccated powder of the anterior lobe by mouth, or from the subcutaneous use of the extract of the posterior lobe and pars intermedia The addition of thyroxin to anterior lobe extract resulted in two cases of Frohlich's disease in a marked increase in metabolic rate which was somewhat in excess of that induced by similar doses in normal persons

BASAL METABOLISM IN DIABETES MELLITUS [18]

The fall of metabolic rate accompanying the period of fasting in the treatment of diabetes mellitus is striking As a rule, during starvation bradycardia develops, and concomitantly a fall in metabolism, decreases of from 10 to 20 per cent being commonly encountered The variations in rate in a series of patients on an ordinary diet, during the period of fasting, and subsequently on the highest caloric or maintenance diet, are shown in Table 10

THE INFLUENCE OF DRUGS ON BASAL METABOLISM

Little is known concerning the influence of drugs on metabolism Organotherapy is the only field of treatment in which any attempt at systematic investigation has been undertaken as yet

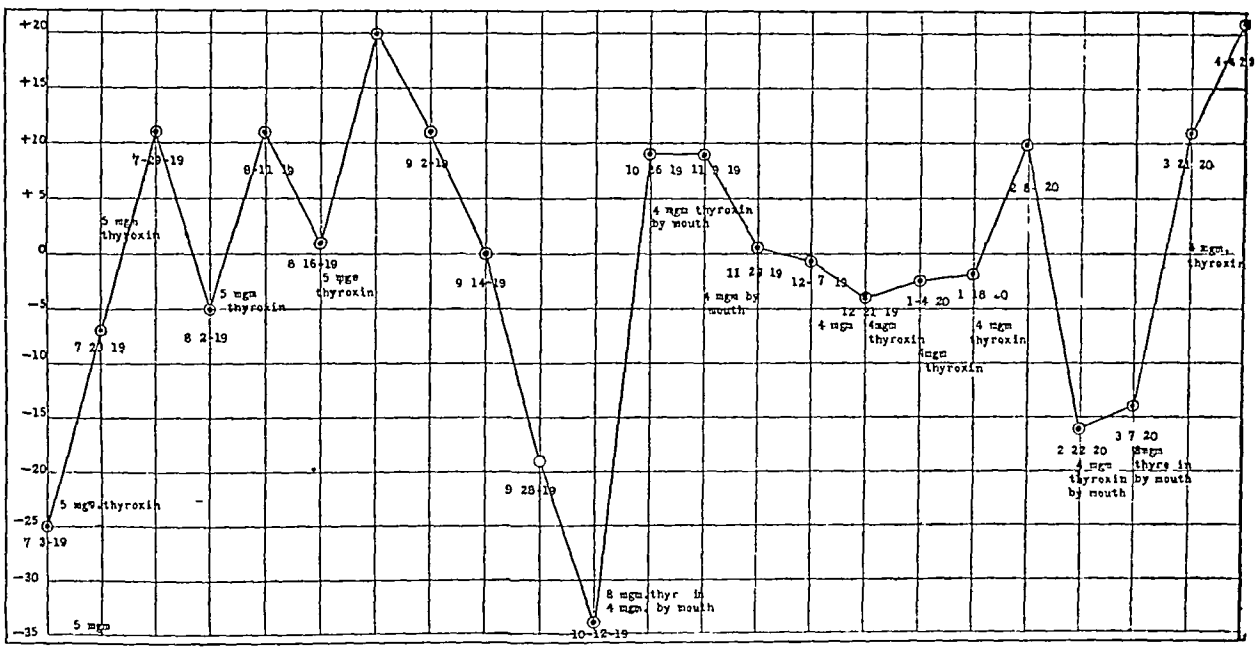

Fig 3 —Effect of thyroxin in cretinism

The effect of subcutaneous injections of epinephrin chlorid has been studied by Sandiford She has demonstrated "an increase of the rate in cellular combustion varying between a calorific increase of from 4 to 48 per cent This increase is usually accompanied by an increase in the ventilation rate, respiration rate, number of heart beats each minute, volume of each beat, greater utilizing of blood-carrying power, and peripheral dilatation with an increased systolic and decreased diastolic blood pressure No relation was found between the intensity of the epinephrin reaction and the degree of hyperthyroidism and hypothyroidism" The increased rates encountered she believes to be in harmony with Cannon's "emergency theory," and with Lusk's findings of an increased metabolic rate in carbohydrate plethora

18 For detailed studies of basal metabolism in diabetes mellitus the reader is referred to Allen F M, and Du Bois F F Clinical Calorimetry Seventeenth Paper Metabolism and Treatment in Diabetes Arch Int Med 1910 1059 (June) 1916 Benedict F G and Joslin E P Metabolism in Diabetes Mellitus Pub 136 Carnegie Inst of Washington 1910 Pub 176 A Study of Metabolism in Severe Diabetes 1912

In relation to the influence of other drugs on basal metabolism no information is available except for caffein, atropin, strychnin, morphin and camphor (Edsall and Means,[19] Higgins and Means,[20] Means and Aub,[12] and Du Bois[13]) Means and Aub demonstrated an increase in basal metabolism of from 7 to 23 per cent, resulting from 10 grains of caffein In therapeutic doses, atropin and camphor have been shown to increase metabolism slightly, morphin to depress it somewhat, while strychnin exerts no appreciable effect

quently pointed out by Kocher of administering potassium iodid to a patient suffering from adenoma of the thyroid

Sodium Cacodylate —In a small series of cases with high rates, sodium cacodylate was administered subcutaneously in courses of 50 mg daily for six days The result was disappointing In one of the milder cases of exophthalmic goiter with a rate of + 31, rest and sodium cacodylate reduced the rate to normal, but in several instances the rate persisted at the same

Potassium Iodid —The effect of moderate doses of potassium iodid was investigated in seven subjects In four cases with normal thyroids no increase in metabolism resulted, although in two of these the drug was pushed to the point of iodism (rash and coryza) Three subjects presented small adenomas, and in each, marked increase in basal metabolism resulted, 20 per cent or more A most striking result is shown in Figure 5, and serves to emphasize the danger so frequently pointed out by Kocher of administering potassium iodid to a patient suffering from adenoma of the thyroid

Sodium Cacodylate —In a small series of cases with high rates, sodium cacodylate was administered subcutaneously in courses of 50 mg daily for six days The result was disappointing In one of the milder cases of exophthalmic goiter with a rate of + 31, rest and sodium cacodylate reduced the rate to normal, but in several instances the rate persisted at the same high level, or actually mounted to higher levels Since Means and Aub have shown a similar drop for rest alone, or for rest with sedatives (barbital, paraldehyd, bromids and quinin), it is more than probable that the rest, rather than the cacodylate, was responsible for the results obtained

Cyanids —On the basis of Hunt's[21] work, in which he showed a markedly increased tolerance for acetonitril in mice undergoing thyroid feeding, sodium cyanid, 3 mg, was administered two or three times daily to patients with exophthalmic goiter and toxic adenoma

TABLE 11—EFFECTS OF CYANID ON BASAL METABOLIC RATE

No	Patient	Age	Sex	Diagnosis	Initial Rate Date	Treatment	Rate Following Treatment Date	Treatment	Rate Date	Comment
1	B W 18629	31	♀	Toxic adenoma	+23 3 4/1/20	1/20 grain sodium cyanid twice daily for 4 days	+30 2 4/9/20	Rest cyanid discontinued	+44 8 4/18/20	Patient growing more toxic cyanid has no effect
2	A L 18702	15	♂	Exophthalmic goiter	+18 9	1/20 grain sodium cyanid twice daily for 6 days	+31 8 4/14/20	Dose increased to 1/20 grain three times daily for 4 days	+33 2 4/18/20	Clinically unchanged
3	H O 18730	38	♀	Toxic adenoma cardiac type	+20 4/10/20	1/20 grain sodium cyanid twice daily for 6 days	+29 4 4/17/20	Cyanid continued	+24 4/24/20	Cyanid has no effect discontinued 4/24/20 +33 2 5/4/20
4	V Y 18763	31	♀	Exophthalmic goiter	+53 4/10/20	1/20 grain sodium cyanid twice daily for 3 days 1/20 grain sodium cyanid three times daily for 2 days	+32 5 4/17/20	Transferred to surgical department	+21 9 4/30/20	Rest may account for decrease in rate

In three instances an increased rate resulted (Table 11) This is in keeping with the findings of Loevenhart,[22] who demonstrated a definite stimulation of respiration following the intravenous use of small amounts of cyanid Whether or not this increase in rate persists was not determined, owing to some apprehension in regard to the continuous use of the drug

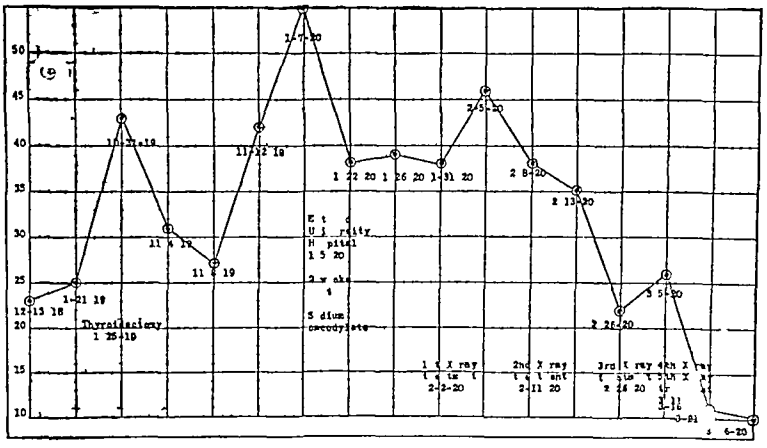

Fig 4—Metabolic rates in treated exophthalmic goiter

CONCLUSIONS

1 The gasometric method of indirect calorimetry is a reliable and practical clinical method for determining the basal metabolic rate

2 The basal metabolic rate is of the greatest significance in diseases of the endocrine system, particularly in diseases of the thyroid, revealing the extent of the increase in metabolism in exophthalmic goiter and in thyrotoxic adenoma, and the extent of the decrease in metabolism in cretinism and myxedema and allied conditions

3 The basal metabolic rate furnishes an accurate index to the results of medical and surgical treatment of these conditions, and thereby becomes of value as a guide to treatment

4 The basal metabolic rate is of value in revealing the effect of drugs on metabolism

ABSTRACT OF DISCUSSION

DR NELSON W JANNEY, Santa Barbara, Calif There is no more interesting proof of the value of pure research as applied to clinical medicine than the development of respiratory apparatus An expert clinical and technical staff and a very large sum of money are required to carry out determinations properly Recent developments are making it necessary to have at least a respiration apparatus in every medical clinic for it is of great aid in the diagnosis and treatment of thyroid conditions It is only fair to question a given laboratory as to the number of controls before accepting point blank even the basal metabolism results Dr Rowntree has shown care in his work of carrying out a sufficient number of controls before he used this method clinically We must demand this at present In our clinic cases are cropping up illustrating the possibility of a normal metabolism rate not always being an exact criterion of the patient's thyroid condition As a rule the return to normal of the respiratory rate is accompanied by marked improvement in the clinical symptoms We have a few cases of hypothyroidism which exhibit a normal metabolic rate over long periods without satisfactory clinical results I have also seen two cases of hypothyroidism, each having previously been subjected to a complete hysterectomy, in which it was impossible to bring the metabolic rate to normal without development of symptoms of a somewhat distressing nature, tachycardia, precordial distress and increase in nervousness It is a question as to whether the loss of ovarian secretion also causes a depression of basal metabolism This seems possible Cases of hypopituitarism which show a decreased basal metabolism are also of interest We have also observed a large fall in the metabolic rate (20 or 30 per cent, or even more) in diabetics undergoing long periods of undernutrition It seems as though we should consider the fact of a low diet depressing the metabolic rate We must, however, await further clinical observations before these points will be checked up satisfactorily

DR H S PLUMMER, Rochester, Minn Dr Rowntree's work corroborates what we have done at Rochester Since 1910 we have used a clinical chart in hyperthyroidism so as to get a definite rate in every case We differentiate between the rate from adenoma and the rate from exophthalmic goiter In adenoma we have a pure hyperthyroidism Exophthalmic goiter is not pure hyperthyroidism In one series of cases the average ran within 1 per cent of the average normal of approximately 39 calories per square meter, while in another series there was a deviation from normal in the basal rate A patient without a thyroid gland has a rate between 38 and 39 points below normal In general it takes about a calory of thyrotoxin to maintain the basal rate at normal In the first case I gave 15 mg of thyrotoxin intravenously This is equivalent to about 200 mg of thyroid extract The next morning the rate was —17 This gradually raised until on the eleventh day it was 17 per cent above normal It remained above normal six days and in three weeks reached its preintoxication rate This was the first attempt to establish the action and dose of thyrotoxin The average does not vary more than one point from the figures we have obtained in administering this in about forty cases of high-grade myxedema We have given thyrotoxin in various conditions and we never fail to get a rise in the metabolic rate except in cases of exophthalmic goiter with a high rate and in cases of large colloid goiters with a large blood supply In these cases we could give as high as 15 mg intravenously without any fluctuation in the rate. We could do the same in exophthalmic goiter Thyrotoxin has never fluctuated the rate in cases of exophthalmic goiter having a high rate I think this is due to the fact that the

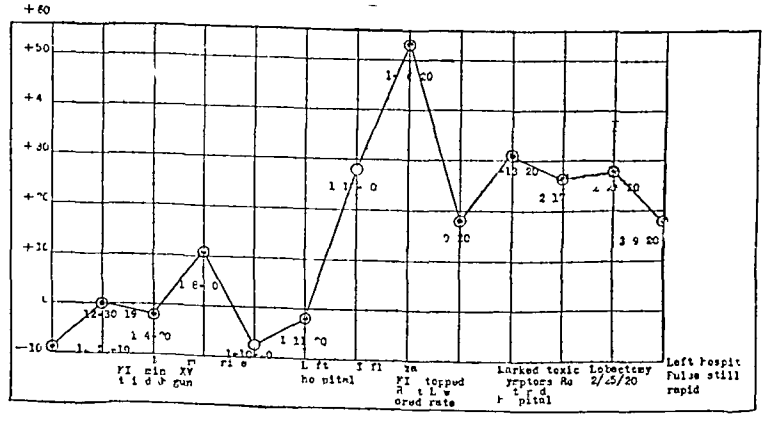

Fig 5—Simple adenomatous thyroid becoming toxic after potassium iodid and acute infection

22 Loevenhart A S Lorenz W F Martin H G and Malone J Y Stimulation of the Respiration by Sodium Cyanid and Its Clinical Application Arch Int Med 21 109 129 (Jan) 1918

gland picks up the thyrotoxin Thyrotoxin is also picked up by the adenomatous goiter If thyrotoxin is given by mouth there is no reaction When it is injected intravenously there is a notable increase in rate If a dose of thyrotoxin is given in other cases, there is a definite, progressive return to approximately normal unless complications are present in the case All the other cases respond to intravenous doses in just the same way A patient with a rate below 15 responds definitely to thyroid in myxedema—a differential point in diagnosis If you give ½ mg to a patient having no myxedema the rate remains normal Also, patients with myxedema do not seem to absorb desiccated thyroid or impure thyroid They are very much more apt to absorb pure thyroid All patients with a rate down require two or three times the normal amount of desiccated thyroid or thyrotoxin to bring the rate to normal Sometimes you can give 200 or 300 mg by mouth with a flicker in the rate, while 1 mg given intravenously will bring the rate up This has been very confusing Many myxedematous patients say they are well when they are not This same individual six or eight months later will have a normal rate and will be perfectly healthy Then again we get the patient who within six weeks after he has lost his entire thyroid gland has developed a high grade myxedema These patients will return to normal immediately on treatment. Young people who have been myxedematous for only a short time return to health

DR BRUCE C LOCKWOOD, Detroit As far as we know now the thyroid has control of the metabolic rate, and an increased basal metabolism means hyperthyroidism, that is, if properly measured and the extraneous influences such as undue excitement, exercise and recent eating are excluded Many patients formerly considered as psychoneurotics are really formes frustes cases of hyperthyroidism, and it is in this class of cases that the calorimeter has its greatest use We have had about twenty patients who were treated with the roentgen ray in conjunction with the usual medical treatment Our results have been excellent The treatments are given two weeks apart The basal metabolic rate falls about ten points with each treatment

DR. LEONARD G ROWNTREE, Minneapolis Figuratively speaking, by the use of thyroxin we can convert the sluggish toad into an active frog The effect following its intravenous injection is remarkable The cretins who before treatment may have been extremely sluggish, after treatment begin to walk, talk and become playful and kittenish It is rather interesting to note that the same type of reaction, i e, marked increased activity which accompanies the increased rate of hyperthyroidism as in exophthalmic goiter, is encountered on converting the low rate of hypothyroidism to that of normal The relative increase in rate is accompanied by marked increase in activity, although the absolute rate is only brought to normal We have had some difficulties with administration of thyroxin by mouth, but we have succeeded in holding some of the patients at a normal metabolism by oral administration Our purpose is to bring the patients to normal and to hold them there With intravenous administration we have never seen any reaction within twelve hours but have seen a large increase in the urinary output in from twelve to thirty-six hours In some instances the rate has returned to normal within five days, but in others not until the tenth or twelfth day The initial change particularly the marked increase in urinary output, which may precede the rise in the metabolic rate, is of interest The flushing of the face and the moisture of the skin may also appear early Following an operation for adenoma of the thyroid one girl went to bed and stayed there for ten years We thought perhaps it was an instance of astasia abasia She showed no signs of myxedema We gave her thyroxin over a period of weeks, she became active walked and finally left the hospital apparently normal She did not show any signs of myxedema, even with a rate of —30 The psychoneurotics interested us a great deal A high initial rate is almost constantly found in them The question arises Is this high basal rate normal for these individuals? In differentiating psychoneurosis from true hypothyroidism the time element is important In these cases a series of daily readings may show a plus 40, plus 30 and plus 15, etc. In some instances within three or four days the normal basal metabolic rates may be obtained We have had many cases where the rate has fallen to normal after operation, under which condition the roentgen ray is not necessary At present we have a series of patients undergoing roentgen-ray treatment This form of therapy should be tried at least in all cases where surgery has failed to effect a cure

---

THE CAUSES OF EMOTIVITY, AND THEIR MANAGEMENT*

TOM A WILLIAMS, M D
WASHINGTON, D C.

It is now a commonplace that perturbations of emotion are frequent causes, not only of inefficiency, but also of ill health of the body itself The physical consequences of emotion are well attested even in the laboratory To the physician, this knowledge, while a satisfaction, is only a preliminary to the search for its application to the cure of disease To this end he seeks, first, to recognize such diseases to differentiate them from others, and secondly, to remedy them Recognition is difficult, for the presence of an emotive state is not enough to signify that the disorder is primarily psychogenic

Many physical conditions are characterized by disturbances of feeling, emotion Intoxications, many infections and visceral diseases all disturb the emotions, and often seriously So do many diseases of the nervous system itself, such as cerebrospinal syphilis, disseminated sclerosis, neoplasms, and what are called the great psychoses These are all disorders of somatic source, the emotional disturbances being incidental, and not susceptible of being dealt with fruitfully by psychologic means, for only the disappearance of a diseased bodily state will dissipate the morbid emotion in cases of this kind

The emotions of psychologic origin are numerous They are not confined, as some writers would have us believe, to sexuality Not always are they the fruit of an internal conflict, not seldom are they quite independent of attempts to repress them

For instance, a woman was frequently and explicitly animated by an intense hatred of her mother-in-law which she made no attempt to repress or conceal This aversion she frankly expressed to her husband without any assuaging of the emotion, or of the suffering it induced although she recognized that for economic reason it was impossible to split up the household

Similarly of jealousy In a number of patients no repression has been attempted, and the jealousy has not even been deplored

Mortification is a very frequent disabling emotion It is based on shame and is always due to an inadequate envisagement of the situation This, in turn, has come about from imperfect knowledge of oneself, and this in turn has often been determined by circumstances giving a false perspective in relation to some mode of feeling or behavior Quite often this has to do with sex material, but quite as often it is due to social causes and the inculcations of others in the family, in school, in business or in society Intrinsically it is a fear mechanism, indeed fear is by far the

Seventy First A
New Orlean

commonest of the incommoding emotions When acting chronically it shows itself as anxiety, and is so frequent that some writers have given a special name to the state "anxiety neurosis" The French have further differentiated, and long ago called "anxiete" the more psychic manifestations, giving the name of "angoisse" when circulatory and respiratory manifestations are conspicuous It is the state which the Germans call "angst"

Not fear itself, but the feeling of impotence is sometimes the dominant emotion This may arise from a feeling of incongruity in the situation so marked as to appear insoluble In some temperaments, rebellion and struggle against this is quickly replaced by resignation This is particularly true of the incongruity which gives rise to the feelings of disillusionment This is an emotion most destructive to the employment of the full activity of the personality in work or in human relationships

It has been the fashion to say that the emotional aspect of all these situations is of transcendent importance in a psychotherapeutic sense This error is only another instance of the very common one in medicine of being unduly swayed by the conspicuous presenting symptom Surgeons have long ceased to depend for their judgments on the patient's idea of the relative importance of symptoms To the psychoneurotic patient, the emotion is all important To the discerning psychopathologist, the really important matter is the causative one Now, an emotional situation is very rarely direct One might almost say that it is invariably determined It may safely be postulated that emotion occurs only when the subject perceives an occasion for it The psychologic process is one dependent on sensation, perception, cognition—that is, intellection This is so even in a rudimentary instance, as that of instinctive reactions of animals, as the scuttling of fish at the sound of a footfall, or a horse running in terror from a strange object

The emotion is dependent on the perception Physiologically, too, it may be stated that an emotion is always conditioned by a perception This is just as true of emotions which appear autochthonous, endogenous The emotion originally induced by a former perception is now induced by the recollection of it However, through association another circumstance may supplement, or even be substituted in recollection for the original inducing circumstance, so that an idea apparently quite extraneous to the provocative one may seem at first sight quite incongruous with the emotion it seems to produce The reaction is then adjudged as a morbid one although in reality it is a perfectly natural response to circumstance The circumstance itself, indeed, in such cases is not merely what it appears There has always been added to it an element unperceived by the uninitiated, which is the real determinant of the emotion produced in the subject

For instance, listening to a sermon in a crowded church would not seem to be sufficient to arouse the emotion of terror to such an extent that it would prevent the subject thereafter from going to church, theater, or crossing the street It was only sufficient in virtue of its association with a faintness and oppression which had occurred on one occasion The significance of this association had not been grasped by the patient Indeed the circumstance was a memory apart It was only when the patient was made to grasp the real significance of this circumstance that her belief could be changed regarding situations which for eight years had been arousing terror and panic, and had brought her to such a degree of inefficiency that she could rarely bring herself to cross the street alone[1]

Even in the dream in which the content seems to be under the sway of the general feeling tone of the moment, in reality the direction of that feeling tone, and the elaboration of the imagery are dependent on former associations, which of course are the fruits of cognition

IMMEDIATE EMOTIONS

It is just as true that the material of brooding or rumination is very often determined, not intellectually, but by the feeling tone, and that the judgments are thereby vitiated The recognition of this is so universal, it is such a commonplace, that we can scarcely wonder that psychopathologists have carried into their studies of emotional manifestations the induction that the feeling tone determines the thought, forgetting entirely that while this is true, both of depressions and exaltations, yet that in the very different states of besetment the reverse is the case To specify, the common saying "to have a jaundiced view" represents the man whose feeling tone, disturbed by physical agents, permits him to harmonize only with depressing circumstances The disordered metabolism of the constipated or the hyperproteotic disturbs the feelings, so that automatically unfavorable or depressing points of view are more easily adopted than cheerful ones The consumptive, whose metabolism is speeded up to produce reactions by which to cope with the invasions of the tubercle bacillus, finds his feeling tone stimulated and active, hence he is in harmony with cheerful, hope-giving situations, and passes by without notice the circumstances of depressing character None of these reactions, nor the many others like them, are ratiocinative They are purely instinctive and depend on autonomic states They are not controllable directly by will The impotence of psychotherapy in such situations is represented by the adage "Never yet saw one a philosopher with the toothache" It is a truism in business not to expect a judicial decision the morning after a debauch

THE MEDIATE OR INDUCED EMOTIONS

The contrary mechanism is so simply exemplified experimentally during the study of the secretory sequences of emotion that it is surprising that there are still those who fail to give it due significance In all the experimental instances it is necessary to provoke the emotion studied by first inducing the cognition of the situation by the animal or the human being experimented on But without any experimental instances we can again resort to common experience in studying the effect of bereavement or ruin of the mechanism which determines the stampede of a crowd, of the various methods of suggestion, such as the flowing of tears in witnessing a melodrama, or the indignation at the abominableness of the villain in a romance

Such emotions as the anxiety so often contingent on the accomplishment of work under another, or the fear of losing one's position, or the fear of failure, when analyzed, will always be found to hinge on apperceptions

No situation apperceived can be divorced from elements contributed by the percipient To no two men

1 Agoraphobia and Claustrophobia Removed in a Week Philadelphia Neurological Association A complete discussion of this case is given International Clinics 4, 1919 under the title Differentia of Phobias and Obsessions

is a given situation alike This has been expressed in Hamlet by the remark "There is nothing either good or bad, but thinking makes it so" It is, therefore, the patient's attitude of mind toward the situation that develops the emotion regarding it which disturbs him

As a matter of fact, however, this is not autochthonous It is invariably induced The induction is usually performed by the mechanism of suggestion This may occur at the moment itself through the word of another directly applied, as when the nurse says to a child, "Do not be afraid," thereby clothing the situation with the idea of danger, regarding which the emotion of fear is legitimate The suggestion, however, is usually far less simple, and often depends on a logical induction, though of course always unaccompanied by full knowledge of true relationships For instance, the so-called birth phantasies are frequently constructions of a child's imagination fabricating an explanation by conjoining, with the untruths he has been told, the facts he has observed

Too frequently to the child are presented utterances in which error or mystery is implicit Over and over again do psychopathologists find constructs arising logically from material in which the careless word of an elder did not recognize the implicit emotion for the child

For instance, a feeling of impotence and hence a diffident emotion regarding the subject of Latin was the unfortunate heritage donated to a boy by the injudicious insistence of an elder brother that he was too stupid to study the classics The fixed idea that resulted vitiated his life by turning him in an artistic direction for which he was ill fitted and preventing him from going into professional life for which his scientific mind would have been admirably adapted

A woman acquired a habit of mumbling because as a child she was ridiculed on account of the shape of her mouth and its size when she laughed In the endeavor to minimize the conspicuousness she avoided opening the teeth widely with extensive movements of the lips thereby affecting the distinctness of her articulation

Indeed, stammering is very frequently induced by dread of making an error of speech, or misstatement of fact, or of saying something that will arouse mockery The induction of this emotion is a function of overstressing by parents or guardian, which acts through a mechanism involving in the speech what golfers call of stroke, "pressing" Having failed several times, especially after ridicule, the child is expectant of future failure and becomes ashamed of it In consequence, he develops phobia at the prospect The phobic state in turn induces such physical consequence as embarrassed respiration and tautening of phonatory muscles This in turn may lead to the use of artificial devices in speech, which temporarily assist, but eventually have also to be got rid of when the stammering is dealt with

THE PRINCIPLE

All this psychologizing would be superfluous were it not that it is absolutely essential for the clear understanding of the principle of the induction of emotion It is by a grasp of this principle that the psychotherapeutist can best recondition his patients' reactions in such a way that circumstances which formerly induced distressing or incapacitating emotions shall no longer do so This is most easily done by the patient when he is made to ascertain the component of the situation which really induces the fear In consequence he can then imbue the situation with the feeling which to it is legitimate This readjustment cannot always be effected at once Practice may be required in concentrating on the efforts needed, for in some individuals the very attempt to consider the situation at all calls into play the very emotion which the whole process is designed to undermine This, however, is merely a matter of habit, and with practice does not take long to overcome Very often the reconditioning is precipitate if not at the first interview then as a culmination or explosion, so to speak, of a consistent effort during several days It may take even longer

Obsession in these cases is merely the haunting of the patient by an idea distasteful to him because of some emotion accompanying it The distress experienced by these patients during their ruminations is a legitimate enough accompaniment of their failure to direct their thoughts into channels which they believe are more proper or useful But for the emotional element of the obsession it would cease to beset

Of the tics, which are impulsions, and of course psychogenic, the same thing is true They are derived from a movement of purposive intent The movement has been originally adopted either to avoid discomfort in the part moved, or in response to reactions toward psychologic discomfort

Thus one woman felt impelled to turn her head to the right and behind because there sat a fellow worker with whom she urgently desired an explanation regarding a misunderstanding

Another woman turned her head to the side away from which her niece used to walk because of the fact that this girl had become engaged to a foreigner, and the aunt was strongly imbued by the belief that marriages with foreigners turned out badly, this because of her experience with many in her family and among her friends Hence, she could not bear to look at her niece on account of the apprehensive grief at the prospect of losing her to misfortune

Of course, the patients were not aware of these reasons They had to be sought

MANAGEMENT

The treatment of morbid emotions of this kind, then, depends on the finding of the situation, the prospect of which determines the emotion It is with the cognitive element of this that we must deal by persuasion Although we say that we change the mental attitude of the patient, we in reality change the situation itself by adding to it or subtracting from it the elements which arouse the incommoding emotion

To do this is an art, and of course requires practice, but no amount of practice is of value unless the mind of the operator is directed toward the proper steps to be taken in performing his physiologic operations

EXTRAMURAL METHODS

It is true that similar reconditioning of mental attitudes and changing of emotions have always been accomplished by means of religion, philosophy, through charlatans, and by accident, but these agencies all possess serious inconveniences [illegible] modification of the patient's religious beliefs [illegible] legitimate function of a physician [illegible] psychotherapy by priests is ineffectual because they have not acquired the knowledge of neurology, without which [illegible] are inevitable, nor do they know

chology necessary for psychotherapeutic reconstruction Indeed, this kind of psychology requires as an essential basis a sound knowledge of physiology, as well as a very thorough knowledge of clinical psychopathology

Thus, a sea captain was referred because of distressing facial tics which prevented him opening the eyes at will, so that he could not go about alone without great distress, and could not read at all The tic was the product of the anxiety induced by intense naval responsibility during the war The systolic blood pressure was found to be 107, and the diastolic, 63 This I attributed to depleted endocrines Suprarenal substance quickly raised it to 152 systolic, 108 diastolic, more in conformity with the state of stress at his age, 50 The stoppage of suprarenal substance and reduction of protein then permitted a fall to his norm, systolic 125 diastolic 90 the psychotherapy that cured the tic having also permitted recuperation from exhaustion

Laymen are not trained to make differentiations of this kind, and the need for them is constant in the practice of medicine, to which the psychologic branch is no exception

The same reasons make dangerous the work of philosophers and psychologists with these patients It is still more true of the pseudoscientific modern religious movements which have healing as a function In one of them, indeed, a destructive negativism is the keystone of the treatment If the patient can be made to believe that no situation is evil, that which has aroused his inconvenient emotions necessarily ceases to do so, but the negation of reality is far too heavy a price to pay for the dispersal of an inconvenient emotion The remedy is worse than the disease

Thus, exhaustion is not only a cause of emotivity, but in some instances it is caused by prolonged emotions The intricateness of these mechanisms is one of the vicious circles so much spoken of many years ago Proper delving into genesis eliminates much of the imprecision attached to these cases

The occasional removal of emotion by charlatans is effected by suggestions usually masked in physical measures, which then act by chance in accordance with the principles set forth in this presentation, namely, the reconditioning of the patient's attitude toward the situation But when the charlatan does so, it is by accident, so to speak, and without the least knowledge of the great principle at work, hence he very frequently misses fire

Accidents are sometimes efficient

Such was the case of the man who had not walked for seven years after a street car accident for which he was heavily indemnified until one night after the plaster fell from the roof his wife found him sitting in the chair in the corner of the room trembling with fright Thereupon she induced him to make the necessary efforts to stand and walk, the success of which dissipated his phobia regarding his power of maintaining equilibrium

As against the numerous failures of any of these methods, the almost universal success of the sound method of rational persuasion forms a striking contrast My personal experience of twelve years shows that it is quite unusual that a morbid emotion cannot be dispelled and permanently so, and that the time taken to do so is more often less than a week than more than a month The cure of emotions in military life, as during the great war, shows that these pretensions are well justified, and that such success should be the rule and not the exception

ABSTRACT OF DISCUSSION

DR JULIUS GRINKER, Chicago There is no doubt that Freudism is responsible for a flood of publications of the type that Dr Williams has given us today, and many of these papers differ from each other only in that they use another phraseology To practice neurology successfully, we must follow the various methods of psychotherapy and choose the method that will suit the individual case A neurologist who knows how to get into the psychology of the neurotic will be able in most instances to get at etiologic factors without much trouble But this alone does not cure the patient It is a question largely of the susceptibility of the patient to suggestion, and no matter how I may struggle against accepting such a view, I think after all the successful treatment of the neuroses is due entirely to suggestion

DR DAVID S BOOTH, St Louis I have not been able to get away from the physical basis of the psychoses I believe that the fundamental element in the production of these psychoneuroses is in the anatomy or physiology or histology, whichever one may appear in a given case I have not yet accepted the theory that these conditions are caused by suggestion or that they are cured by suggestion entirely The fact that many of these patients recognize the error of their obsessions shows that they cannot be cured, in all cases at any rate, by suggestion Such cases show that the disease is not caused by the idea, but by some physical condition of the body The basis is there, and the idea is the result of this anomaly Faith cure, or psychotherapy, if you want to give it a name that will be accepted by the medical profession, simply gives these people a settled philosophy of life If their condition is not severe, by which I mean if the changes in the nervous system are not great, they will, perhaps, recover from that treatment alone But I believe that in all cases the physical basis of the condition should be treated, at least in conjunction with the mental element

DR HYMAN CLIMENKO, New York There are distinct psychic traumas, distinct psychic conditions, that produce neuroses and these neuroses are cured by psychic methods, whether Freudian or Christian science or rabbinical, etc, does not matter The Freudians have contributed largely to the study of psychology, although they have not in the matter of treatment and cure I know of many cases in which psychanalysis has aggravated the condition Dr Williams mentioned high blood pressure This is often produced by psychic trauma, in which case, the high blood pressure will be reduced simply by talking with the patient and appealing to his reason in other words, using one or the other type of psychotherapy

DR KARL A MENNINGER, Topeka Kan There is constant talk about curing patients by "persuasion," by "suggestion, by "explanation," by "analysis" but by what particular technic is rarely indicated It is rarely clear whose method is used or what particular steps are taken, consequently these men only encourage the skepticism of those whom they would convert I suggest that they come to this meeting and stage an impromptu session of this kind, have a voluntary patient from among ourselves come forward and be treated by the method of the author's choice, here in front of us all Then all may see what the psychotherapists do instead of hearing about persuasion or reeducation or readjustment by name only which never gives much to some of us because we do not know what the psychotherapist does when he does it, or what he means when he says it

DR C F NEW Indianapolis In regard to the psychogenic origin of the underlying ideas of anxiety, which is the basis of the majority of the fears which beset these patients A close analysis of a large percentage of these conditions will disclose the fact that there is an underlying source of worry which the patient is trying to overcome and which he does not want any one else to know about, and until that phase of the condition is cleared up or it is suppressed there is no peace of mind for that individual, no matter what you do Before any psychotherapist or anybody else can make any impression he must secure the confidence of the patient, and the best way to do this is by detailed, careful examination of the patient, his history and his present condition

DR ROSS MOORE Los Angeles One neurologist will say that it is impossible to make these people better, while another will say that a great deal can be done by psychotherapy Both are right, although seemingly opposed to each other, and the reason is this One man has in mind the classification which refers to the individual whom I call the essential inadequate—the individual who is narrow and cannot be otherwise

DR. G H BENTON, Miami Fla Even here, before a body of neurologists and psychiatrists, the personal reaction to the words psychanalysis and psychotherapeutics tends to bring about at once a very marked personal equation, individual in character, and of emotive quality This is the very thing that is occurring continually in psychoneurotic patients who are very limited in their field of apperception Therefore, they lack judgment. Their emotivity has a great range and is very vacillating but the means which we use to reach them, or in other words, the tools we use, remind me very much of our automobiles They are selected by virtue of our particular choice, but we all "get there' just the same And so it is with the neuroses We accomplish results first, by our own understanding of the case, through our own methods, by our own individual possibilities by first determining what exists and then by inquiring of the patient what does this mean to you what does that mean to you what does this situation lead to and how do you react to it and then, by trying to interpret these things and to determine further if the patient actually understands the words we use as we understand them We often observe ourselves jumping around from one theory to another because it does not quite appeal to us or because we can find methods by which we can reach our patients and help them in spite of the individual equation—the patient himself The personal equation is one of the greatest difficulties we have to contend with This involves the personal equation of the physician as well as the personal equation of the patient We are dealing with these things in our hospitals for the psychoneurotics We are able to reach them to a greater or lesser extent but through very varied methods Some are brought back to their former mental and physical level, others somewhat above that level Although sometimes an immense amount of time is spent to attain the results and to insure their permeability, we are getting at it in our own individual ways

DR GUSTAVE ROUSSY Paris France (Translation by Dr Williams) Babinski has long maintained that emotion is only an accessory or adjunct factor in these cases, the real factor being the suggestion, and that the emotion quickly disappears when counter suggestions are made On the other hand Dr Roussy and his colleagues along with Professor Dejerine, contend that the emotion is rather the primitive factor, because people are constitutionally or otherwise overemotional, and they react in this way to the occasions which arouse the emotion They think that their experience in the war confirms this opinion, while Babinski and his followers believe that the war confirms theirs

DR GEORGE A MOLFEN, Denver I think we are privileged to speak of the neuroses as attributable to high elevations, since we find that the susceptibility to this emotional shock, to suggestion to the other irritable influences disappears when these persons seek the lower levels such as the seashore Some persons cannot live in the high altitudes because of the nervousness induced thereby They could go to the seashore and become quite relieved and comparatively calm In the war department manual is given a very clear description of the increase in nervous excitability experienced in high elevations This, as I pointed out sometime ago, is due in large measure to the lowering of the blood values, the cellular and chemical elements, particularly the hemoglobin Of course, we recognize the importance of constitutional inferiority and the relation of this constitutional inferiority to the endocrines as well as the conditions on which these high degrees of suggestibility may be premised Not only do we have disturbances due to the hemoglobin and corpuscular diminution which was observed by Haldane Barcroft and the men who headed the Anglo-American Pike's Peak expedition establishing the data with reference to the blood but we can also look to the calcium deficiency as reducing the stabilizing character of the protoplasm so far as irritability is concerned I do not believe that we should rely too strongly on the external influences, although they have their exciting possibilities but we must also keep in mind the somatic disturbances and those forces which relate particularly to the body metabolism

DR TOM A WILLIAMS Washington D C In my paper I adequately took care of all the physical causes which some speakers have brought forward Such conditions as essential inadequacy or constitutional psychopathy we are not considering What Dr Neu said is justified—we must make the patient cure himself When dealing with an inadequate one cannot expect of him what you would expect of a normal man I deal here therapeutically only with cases in which the induction is purely psychogenic In certain physical states the emotivity is exalted In hyperthyroidism for instance all these factors are highly exalted you cannot expect to cure that patient's emotivity by psychotherapy We can only carry these cases along and help the physical treatment Babinski has helped us to differentiate between organic and functional nervous disease The differentiation depends largely on the anamneses and partly on the results of treatment I tried to emphasize that all the emotive reactions of the kind of cases I speak of are purely secondary to the conditioning of an apperception just as the animal which reacts from the emotive standpoint does so simply because of the apperception of the bell and the meaning attached to bells As to the challenge to demonstrate a particular method I am willing to do it provided the right kind of case is selected and inasmuch as certain patients have difficulty in doing this before audiences we must have privacy, and a patient should be chosen in whom a rapid cure is possible and there are many In the long standing cases that does not suffice we must penetrate to the foundations of this thing find the mechanism and reorientate the patient It takes longer and one has to be familiar with psychopathic disease It is not a matter of phraseology it is a matter of principle Suggestion must be religiously avoided It is not upbuilding

We do not need to interpret these things by dualistic philosophy It is a monistic phenomenon purely Psychologic reactions are physical reactions in reality stated however, dynamically and qualitatively only as against those of the chemist which are stated ponderately, and those of the physicist which are stated quantitatively

ENDOCRINE IMBALANCE IN THE FEEBLEMINDED*

OSCAR J RAEDER M D
BOSTON

The close relationship that exists between the internal secretions and the central nervous system has long been known The fine changes of temperament associated with the early stages of pregnancy, the varying neurotic conditions, from slight unrest to grave neurasthenia that result from a dysthyreosis is common knowledge of the observant internist and the trained neuropsychiatrist So impressed were the ancients with the relation of the generative and gonadal influences on the mentality that they regarded the seat of hysteria in the uterus and named it accordingly Cretinism is an example of a recognized endocrinopathy The constant association of the athyreosis with the marked hypophrenia and microsomia disproportionate tissue growth, and other characteristics, stamp it as a frank ductless gland disease The marked resem

* From the Laboratories of the Massachusetts State Psychopathic Institute
Read before the Section on Medical Psychology of the Seventy First Annual Session of the American Medical Association New Orleans April 1920

blance of certain factors in other kinds of feeblemindedness with developmental anomalies, uneven growth rate,[1] and various general and special tissue changes to the cretinic hypophrenia, has shown the desirability of further information in regard to the endocrinous factors in feeblemindedness in general

From the results of careful experimentation in physiology and biochemistry, and accurate clinical observation verified by pathologic study both during life and after death modern scientific opinion is agreed that the development and growth of the animal organism is regulated to a great extent by definite and potent highly complex chemical substances called hormones, the internal secretions of the ductless glands A constant change in the chemical balance occurs with the progressive periods of growth, more or less independent from the daily or continuous physiochemical balancing of the metabolic functions of the cytoplasm constituting the immediate life

Besides this hormonic or chemical connection or interrelation between the various parts of the body we have another system which binds the parts together, namely, the neuronic or nervous system It is by a smooth and well-ordered interworking of the neuronic and hormonic connecting systems that a being is kept in normal poise An interruption of the nervous or electrical control, or a disproportion between the various elementary substances or internal secretions forming the chemical combining system, or an altered condition of one or more of the constituent hormones will destroy the balance between the two systems and result in an abnormal or pathologic state

A great deal of attention and research has been devoted to the nervous control both of the body and also its influence on the glands of internal secretion I now propose to study the relationship to, and effects of, the internal secretions on the nervous system As regulators of metabolism, to use the words of Noel Paton, they exert an influence on the growth and function of the brain and nervous system in general, as well as on the rest of the organism

As a basis for this study, 100 cases of feeblemindedness that came to necropsy have been taken in chronological order from the pathologic service of the Massachusetts Commission on Mental Diseases They include cases from the Massachusetts schools for the feebleminded at Waverley and Wrentham, and from other state hospitals

The cases had been studied clinically in the routine method at the various institutions and after the standardized system developed by Dr W E Fernald at the Waverley School, including Binet-Simon intelligence ratings The necropsies were complete, including head, cord and soma in all cases, and were performed by Drs M M Canavan and D A Thom according to the inclusive method outlined by Southard The data, clinical and postmortem, were all collected in the usual way, symptoms and signs and pathologic changes and findings being noted by the regular examination methods Thus, neither during life nor at necropsy was there any particular or special attention given from the endocrine point of view

Data have been collected from a gross pathologic study of this series of brains and somatic organs, especially the ductless glands In one third of the cases a microscopic examination of the glands was also made Aplasia, hyperplasia, pigmentation and interstitial change not due to age, glandular proliferation, anomalies such as absence or accessory organs with lessened or increased function, besides special changes in the secreting epitheliums and cells of the individual and various glands are the main factors included in our summation of the changes

In a previous study,[2] the question of syphilis was considered Attributing inflammatory and exudative changes, such as early arteriosclerosis, aneurysm, chronic periostitis, saddle nose, chronic meningitis and vascular changes of a doubtful nature to syphilis, we found eleven cases among those in which there were gland changes Wassermann reactions were not obtained in many of these cases, so that reliance on grosser pathology was necessary

TABLE 1.—GLAND CHANGES

	Number
Extreme	10
Marked	11
Moderate	53
Absent	26

The incidence of glandular change is shown in Table 1 Under the designation "extreme changes" are classed those cases in which three or four glands were involved and in which there were marked anomalies of growth, underdevelopment, disproportion of body parts, such conditions as dystrophia adiposogenitalis, etc There were two cretins

In the second group eleven cases showed marked endocrine signs, in which at least two glands were involved, correlated with distinct changes in growth and anomalous development Combining the first two groups, we have 21 per cent of cases showing presumptive evidence of marked internal secretory disturbance

The third group included fifty-three cases in which changes of one or two glands were demonstrable, with irregular and unusual combinations

Gland changes were entirely absent in twenty-six cases

TABLE 2.—PERCENTILE ANOMALIES

	External	Visceral	Cerebral
Paresis (100 cases)	23	29	27
Hypophrenia (60 Cases)	73	58	75

A tabulation of anomalies (Table 2) divided into external somatic, visceral, including the ductless glands, and cerebral, showed an interesting comparison In the absence of data on normal individuals, 100 cases of paresis were selected Paresis being in each case an acquired disease, it was assumed that they might be potentially representative of the normal type[3]

The marked preponderance of anomalous manifestation in the feebleminded over the cases of acquired disease is striking Attention is called especially to the third or cerebral group, in which 75 per cent of hypophrenics showed anomalies, compared with only 27 per cent of the acquired-disease cases, as significant of a possible influence of the growth regulating secretions on the development of the brain

Among anomalies of development the stature first demands attention Our observations on height

1 Coddard H H Height and Weight in Feebleminded Children in American Institutions J Nerv & Ment Di 39 April 1912

2 Raeder O J A General Nosological Grouping of One Hundred Autopsied Cases of Feeblemindedness presented before the New England Society of Psychiatry September 1919

3 Only sixty of the hundred cases were selected to compare with the 100 cases of acquired disease because the combined 160 necropsies were performed by the same hand insuring a more even and regular observation

agree in a general way with those of Shuttleworth[4] Tarbell,[5] Wylie[6] and the compilation of statistics by Goddard[1] in that we found the majority of patients undersized In Table 3, percentile figures show 60 per cent varying from the normal, of which 51 per cent were undersized and 9 per cent taller than the normal given for their ages Thirty-eight per cent were normal, allowing a variation of 10 cm as within normal limits Data were not available in 2 per cent

TABLE 3—HYPOPHRENIA STATURE IN ONE HUNDRED CASES

	Per Cent
Undersized	51

Normal (± 5 cm)	38
Unknown	2

The question of growth has been studied experimentally in tadpoles by the feeding of various ductless gland substances in the laboratories of Gudernatsch and others Gudernatsch[7] has shown that tadpoles fed with thymus are overgrown and underdeveloped, also that examples of the same hatching fed on thyroid develop more quickly, but at the expense of size and weight

In the curves on growth, Tarbell,[5] and especially Goddard,[1] have shown that hypophrenics grow faster but stop sooner than normal children Allowing for differences in comparative anatomy, the question arises whether this phenomenon may not be due to an imbalance of the thymus and possibly later also of the pituitary gland Certainly the same overgrowth of the thymus-fed tadpole corresponding to increased height and weight in the preadolescent stage of the feebleminded, as shown by Goddard's tables, and the underdevelopment or immaturity of the tadpole can be correlated later with the stunted development and hypophrenia of the abnormal child

The incidence of changes in the individual glands is shown in Table 4 The pituitary gland was found

TABLE 4—ADENOSES

	Per Cent
Thyroid	19

Suprarenal	27
Sex	38
Thymus	12
Others	6

involved oftener than any other gland, in 40 per cent of cases The sex glands, the seat of numerous anomalies which brought their score up considerably, were second with 38 per cent The suprarenal showed involvement in 27 per cent of the cases and the thyroid in 19 per cent It is noteworthy that the thyroid falls so low in the scale With the frequency of thyroid disturbances one might expect a larger number of cases showing a pathologic condition of the thyroid

Numerous cases showed various combinations of glands involved Table 5 gives the pituitary polyadenoses It was involved singly in fourteen cases Pituitary with gonads, in nine cases, was the most common dual adenosis, though there were combinations of sex and thyroid in four instances, sex and suprarenal in four cases, and in three cases the thyroid pituitary and gonads were affected in triple involvement

TABLE 5—POLYADENOSES

	Number
Pituitary	14
Pituitary Sex	9
Pituitary Suprarenal	5
Pituitary Other Glands	11

Furthermore, there were six cases in which the gonads were combined with three other glands, two included the gonads, thyroid, pituitary and suprarenal, two, gonads thyroid, pituitary and thymus

Of the third two in which thyroid, pituitary, suprarenal and sex glands were involved, one was a female cretin, and the other an obese eunuchoid idiot who had been castrated in early life He showed all the typical characteristics — undeveloped penis, and feminine appearance of breasts and extremities, with flabby pendulous abdomen

REPORT OF CASES

In order to illustrate the striking endocrine characteristics that were found in many cases of idiocy and imbecility, two of the cases have been individually charted and are shown in Figures 1 and 2

CASE 1—*History*—Figure 1 represents a male idiot, aged 10 years He was admitted to the Massachusetts School at the age of 6 He was 3 feet 9 inches tall and weighed 43 pounds, he was poorly developed and nourished, had chronic bronchitis had a dry, coarse skin and sparse coarse wiry hair, there was a systolic heart murmur at the apex, the genitalia were infantile, there was an umbilical hernia, a protruding abdomen and poorly developed muscles, the hands were thick and short with stubby fingers, the forehead was bulgy the face asymmetrical with large protruding ears, there was a chronic discharge from the nose, the tonsils were enlarged, with adenoids and a fissured tongue There was some question whether or not the patient was a cretinoid idiot

There were six children of whom the patient was the second The first three children resembled one another rather closely and all died at the Massachusetts School for the Feebleminded Three later children were normal, one dying in infancy of diphtheria An uncle and a sister of the patient had spinal trouble, the sister in question became partially blind There was a feebleminded and epileptic great aunt One of the mother's sisters was migrainous and obese, one living child of the sister had one arm not fully developed Both the patient's mother and maternal grandmother are stated to have been nervous and the patient's grandmother was also migrainous On the father's side one sibling was deformed with spinal curvature There was also an epileptic and feebleminded great-aunt

The patient began to talk at about 1 year and to walk alone at 19 months Peculiarities were first noted at 2 years The patient had a peculiarity in speech using d for the first letter He was able to help in dressing and undressing himself and to feed himself with a spoon or fork

School Progress School Examination, Practical Knowledge and *Economic Efficiency* were all nil

Social Reactions—The patient was stubborn and irritable running about in his own way screaming when touched to be dressed or undressed spitting on the floor and yelling if he did not wish to be moved he would not eat if any one was looking at him, he had lost capacity to feed himself throwing food about, he was attracted by striking colors in dress If given a toy he would go by himself to play with it screaming if another child went near him

7 Gudernatsch J F Feeding Experiments on Tadpoles Arch f Entwickl d Organ 35, No 3 (Dec) 1912 Am J Anat 15 No 4 (Jan) 1914

Psychologic Test—The Binet test, performed in May, 1914 at the chronological age of 8 years, gave the mental rating at 1 year

Further History—The patient required nursery care He was in the hospital and infirmary most of the time with untidy habits He had frequent illnesses, including chickenpox measles, bronchitis and indigestion, he grew thin and developed a cough in November, 1915, he had a slight unilateral convulsion with twitching of the right side of the face There was severe dyspnea with mucus in the throat and a weak pulse The patient showed symptoms of meningitis and remained comatose Three days later slight paralysis of the right side developed, followed by death the next day The cause of death was meningo-encephalitis and hydrocephalus

In Figure 1 are shown, first, the small stature and general microsomia, secondly, hydrocephalus, this was considered as being evidence of syphilis A postmortem Wassermann test was negative on the serum, thirdly various dystrichoses, namely, hairy growth over the chest and abdomen upper arms and forearms, abundant hair on back and neck with absence of crines pubis and axillary hair Over the head it was coarse and rough and arranged in multiple cowlicks, fourthly, microphallus, the penis being small with redundant prepuce Besides these anomalies and abnormalities the pituitary was cystic and there was little sign of activity in the secreting cells of the anterior lobe and marked increase in the pigmentation of the posterior lobe cells

Fig 2—Case 2

CASE 2—*History*—Figure 2 represents a female Mongolian, aged 18 years who rated 3½ by the Binet intelligence scale She was admitted to the Massachusetts School at 8 years of age At 17 she was 4 feet 6½ inches tall and weighed 72½ pounds She later increased 12 pounds in weight The patient was fairly well developed and nourished she was a mouth breather The skin was coarse the circulation poor, the heart sounds weak with systolic murmur at the apex, the heart was enlarged the fingers and toes were short and blunt, the face was asymmetrical the eyelids were inflamed the nose flattened the tonsils large and the tongue fissured The Wassermann test was negative

The patient was the first born of two children The younger brother is normal The father had an enlarged heart he was of a gouty asthmatic diathesis and died of a paralytic shock He had an epileptic seizure at the age of 30 and two more after marriage one just previous to the birth of the patient He had a violent temper and was subject to severe headaches The parental fraternity was further checkered with nervosity and paralysis agitans, and there was a question of insanity On the mother's side two brothers were epileptic and a sister was backward Two brothers and one sister are described as normal A distant cousin had schizophrenia and her brother was hypophrenic

Peculiarity in the patient was noticed at 1½ years She began to walk and talk at 2½ years, she was never able to say such words as or and if , she did not know the alphabet and could not read or count She was tidy and could aid in dressing and undressing herself, she could use a spoon but not a knife and fork nor could she tie her shoe strings She was described as sometimes obedient and as being fond of picture books and blocks

School Progress and *School Examination* were nil

Social Reactions—The patient was quiet and inattentive, her name had to be spoken to attract her attention

Waverley School History—The training class records show a deficiency in industrial adaptability At 12 years she was described as clever at playing simple games, catching a ball, etc Later on after the age of 12 she learned to sew and use scissors well From 1905 to 1909 (age 9 to 13 years) she showed slow but definite improvement She had changed under training from a repulsive, drooling finger-sucking, untidy, stupid patient taking short, choppy steps, to a tidy patient who had completed the first school course and had begun to take part in manual training Her resistance to disease was low, she was subject to infections of various kinds She was admitted to the hospital ward, April 23, 1915 with severe bronchitis and pleurisy She died of tuberculous bronchopneumonia May 26 1915

She was of the usual Mongolian type with the characteristic tissue and developmental changes In Figure 2 we have abridged the enumeration of these characteristics, showing microsomia, very small thyroid and suprarenals, hyperplastic thymus an interstitial inflammation of the ovaries and hypophysis a general lymphnoditis, including tonsils and adenoids and dysgenitalism in the form of unequal labia majora long urogenital cleft, large, prominent clitoris and a high position of the mammae

Three of the Mongolians showed extreme glandular change, one showed marked involvement, and the fifth one moderate dysadenosis Thus all five cases of Mongolianism showed gland changes besides the usual typical characteristics

SUMMARY

In this study, the developmental, tissue and gland changes have been charted in 100 cases of feeblemindedness that came to necropsy, taken in chronological order from the pathologic service of the Department of Mental Diseases of Massachusetts Data found in the case histories and necropsy protocols were gathered in the regular way without reference to the endocrine point of view It has been shown that 21 per cent of cases showed marked glandular involvement, with changes of a lesser degree in 53 per cent additional, making a total of 74 per cent in which there were signs of gland change In eleven of these there were signs of syphilis Not having Wassermann reactions in all cases, it may be argued that others of the glandular cases may have been syphilitic Vice versa, some of those designated as syphilitic because of vascular or chronic inflammatory or exudative changes, may not have been syphilitic Furthermore, the dysfunction of the endocrine system itself may be due in these cases to syphilitic influence on the secreting cells of the glands In Figure 1, though the hydrocephalus points to a possible syphilitic involvement, the Wassermann reaction was negative

The pituitary has been found invaded more often than any other gland The small stature so common in the feebleminded may be correlated with this fact, in view of the powerful influence of the pituitary gland on growth

The gonads were shown to be affected in 38 per cent of cases Also anomalous development was most rampant here This is not remarkable when the embryology of the genital tract is considered The similar, not to say identical, development of the urogenital tract in both sexes up to a certain embryologic stage, and then the more or less arbitrary determination for male or female would seem to give much more opportunity for anomalies, misdevelopments and malformations than in other parts of the organism where the developmental homonomy is not interrupted

Macroscopic studies of the brain anatomy have shown numerous reversive types and evidences of arrested development or maldevelopment Microcephaly, especially in the Mongolians, was common Macrogyria, in one instance almost to absence of any fissuring in the frontal regions of the two hemispheres, was of frequent occurrence Extraneous fissuring, "affenspalte" lateral inequality, microcerebellum correlated with sprawling gait, and deficiency of parietal and occipital lobes with various degrees of exposure of the cerebellum, were some of the more striking changes found in the encephalon

MICROSCOPIC EXAMINATION

Among the microscopic findings, interstitial change, aplasia, pigmentation and varied staining reactions were noted The pituitary was frequently found cystic, especially dilatation of the cleft in the pars intermedia The cells of the anterior lobe showed varied staining reaction, the most common change being a deficiency of basophil cells In the posterior lobes, marked pigmentation occurred in several instances in very young individuals

The aplastic condition of the thyroid was present in the cretins A hyperplasia of the glandular epithelium was noted in several cases, and increased interstitial elements were also common In one of the Mongolians an infantile condition of the thyroid with absence of colloid was noted In a few cases the vesicles were distended with colloid

The tests usually showed signs of activity in all except the lower grades The idiots' testes were either inactive and fibrous, or only feeble signs of spermatogenesis were found The ovary was examined in only a few cases, but seemed less virile than the male gonads Two cases of imbecility showed no ovarian activity, and in a third case only very slight evidence of function, one graafian follicle in a section, was found

No characteristic changes were found in the suprarenal gland In one case—a tuberculous subject—there was considerable involvement of both suprarenals with tubercles, numerous giant cells, etc There were no signs of Addison's disease present

CONCLUSIONS

1 The evidence of gland changes observed in these cases by routine examination methods, clinical and postmortem, without particular reference to endocrinology, is so constant and multifarious that we cannot but regard them most seriously There were gland changes of one sort or another in 74 per cent of cases Marked gland changes occurred in 21 per cent

2 With the constant and characteristic bony and soft tissue changes microsomia, lowered resistance to infection, poor circulation, loose jointedness, and changes in the glands of internal secretion, Mongolian idiocy bids fair to be founded on an endocrine pathology

3 The internal secretions begin to exert their influence early in the life of the organism It is known that permanent adjustments of the other glands and tissues follow on the absence or dysfunction of one gland or set of glands In order to avoid such permanent changes as infantilism dwarfism, acromegaly, microcephaly and feeblemindedness, it is imperative that these conditions be recognized and remedied by supplying the deficient hormone or inhibiting the hyperfunction of a gland early in the course of the disease After permanent adjustments have formed, improvement is difficult, with early treatment, results are often little short of marvelous

4 Much of the finer pathology of the ductless glands is concerned with biochemical reactions Further studies of feeblemindedness by physiochemical and roentgenologic research would no doubt throw more light on this obscure field

---

ABSTRACT OF DISCUSSION

DR TOM A WILLIAMS, Washington, D C In the attempt to establish a correlation between endocrine deficiency and poor cerebral development we must avoid the danger of the *post hoc, propter hoc* argument Dr Raeder's theory may be tenable, but two objections occur to me

First, in relation to syphilis Syphilis affects all structures of the body and the feeblemindedness in congenital syphilitics may be primarily cerebral Therefore, in estimating a statistic it is perhaps fair to eliminate the cases of syphilis Secondly, we should have a control, namely postmortem examination of the bodies of a large number of dead persons Why say that in 100 necropsies certain evidences were found which tend to establish a correlation between endocrine deficiency and feeblemindedness, when these findings may be the effect of the disease which has terminated in death? These cases must be eliminated In regard to the microsomia of these patients, is it necessary that it be attributed to hypoendocrinia? Perhaps not Anomalies of growth are the result of endocrine disturbances, but is the growth of the individual who grows without anomalies dependent entirely on endocrine factors? It is doubtful whether we can include microsomia as one of the effects of endocrine disturbances

DR GUSTAVE ROUSSY, Paris, France (Translation by Dr Hitchcock) We must be cautious in our conclusions regarding the role of the endocrine glands, not too hastily deciding as to the absolute relations of cause and effect in regard to polyglandular syndromes Indeed, if one examines systematically the endocrine glands at necropsy on subjects dead of the most diverse affections, as I have done in more than 200 cases, there will be found lesions of several internal glands not usually occurring in this type of patient Besides the endocrines proper, other tissues are concerned In a case of Parkinson's disease I found lesions of the parathyroids The causes of lesions of the endocrine glands, as shown at necropsy, are numerous complex and inconstant, therefore it is prudent not to be hasty or final in drawing conclusions concerning these lesions

DR WALTER TIMME, New York The main difficulty with regard to all internal glandular disturbances is that we do not have a definite static series of organs The endocrine glands are all of a character designated in mathematics as variables, there are no constants In order to solve an equation or series of equations which involves variables you must have *one more equation than you have variables Here we* have from ten to fifteen variables and only one equation Hence we cannot solve the problem We can only approximate to a solution If Professor Roussy has examined at necropsy 300 cases of various diseases in which the endocrine glands were found to be involved then these disturbances are part of the process of the disease They may have been produced by the disease and they may have indicated the lethal termination In other words they are terminal states But when Professor Roussy states that the presence of such lesions in the feebleminded is nonconclusive as to the pathogenesis of feeblemindedness, I can only ask Do they not suggest a possible cause? Their absence would beyond peradventure be regarded as conclusive! Dr Raeder claims that in 100 cases of necropsy on the feebleminded he has seen a large proportion that showed definite changes in the internal glandular system He has approached the subject in a different way than it has ever been approached before and he has arrived at a definite, high percentage of disturbance in the endocrine glands His work presents a distinct advance, a new angle of attack in this pro[illegible] has attacked entirely on the psy[illegible]

little result If these disturbances of the internal secretory organs produce idiocy, why does not every disturbance of the internal glands produce idiocy? For this reason It depends on how the glands are constellated There are certain constellations of these glands which will produce a condition of diabetes, another which will produce giantism, a third acromegaly, a fourth Addison's disease, etc It depends on the subject's reaction to these disturbances as to which disease will develop I tried to bring this out in a table of endocrinopathic inheritance some years ago I examined every member of a family through four generations The original parents were a giant and a diabetic Through four generations there were all kinds of endocrine disturbances varying from exophthalmic goiter to microsomia, and including two morons Heretofore in investigating ancestry all we looked for was mental disease That is wrong, mental disease is only one phase of a disturbance, just as is epilepsy

DR. M A BLISS, St Louis It is only by such extensive studies as this, made under opportunities that come only to those who work in institutions of that size, that we shall be able eventually to arrive at some conclusions in regard to these things Dr Raeder has made a definite advance toward perhaps, finally reaching some conclusions about the association of the endocrine glands with these mental deficiencies and disturbances

DR. ANDREW L SKOOG, Kansas City, Mo The brain specimens presented by Dr Raeder are suggestive of hereditary disturbance or secondary anomaly of the brain developing at some early stage Those who have studied the cases of various types of idiocy will agree that the patients reach full development at an earlier age than does the average individual, and probably more so as related to the central nervous system

DR. KARL A MENNINGER, Topeka, Kan Work like this furthers the study of the interrelationships of physical and mental disease We have too long regarded the patient as carrying his brains in one basket and his visceral organs in another, and from our standpoint we have looked only at one basket Endocrinologists deserve praise for calling attention to their field of the human organism We have ignored a relationship which is far closer than we know at present, far more intimate and intricate, perhaps, than we even suspect

DR OSCAR J RAEDER, Boston Syphilis is to be considered in all cases of feeblemindedness Fifteen per cent of our 100 cases were syphilitic, only two of the twenty-one endocrine cases were suspiciously syphilitic, but we had no Wassermann in these cases Some of these cases date back as far as eight or nine years, before the Wassermann test was so regularly done as now In necropsies on the insane and the feebleminded we frequently find gland changes and many of them are terminal changes I would not assign that as a cause of feeblemindedness if the patient had been feebleminded Such lesions frequently are found in necropsies, especially in senile cases Dr Timme regards feeblemindedness as one manifestation only in an endocrinologic heredity In every biologic study the relation of the endocrinologic factors to growth and development is very important, as has been shown in experimental work on the frog The frog fed with thymus gland was overgrown but underdeveloped, while the frog fed with thyroid gland was overdeveloped but undersized That point was brought out by Dr Timme in his example of four generations of one family in which there were two morons, some acromegalics some giants while some showed other gland changes I make no claim that endocrinologic factors are the cause of all feeblemindedness I simply call attention to the marked gland changes found in all cases of feeblemindedness I would be glad to find one definite glandular syndrome as the cause of one definite feeblemindedness There are many feeblemindednesses, such as syphilitic, glandular, traumatic, etc Dr Menninger and Dr Skoog emphasized the fact that in the past the nervous system has been studied separately from the rest of the body We have *not sufficiently considered* the body as related to the central nervous system As Dr Southard used to say we look at the neurons but the body is connected up not only by neurons but also by hormones, and these must be considered together

THE SURGICAL TREATMENT OF BRAIN ABSCESS*

A W ADSON, M D
ROCHESTER, MINN

A brain abscess may pass through three distinct phases, the initiatory, the quiescent, and the terminal[1] It should be operated on in the quiescent stage, not in the initiatory or terminal, as is frequently done

During the initiatory stage the patient is more likely to present symptoms of diffuse encephalitis and meningitis than of localized tissue destruction In many instances the disease passes into the quiescent stage with little trouble except for symptoms of intracranial pressure, which are difficult to distinguish from those produced by brain tumor, or it may be interrupted by death in a comparatively short time

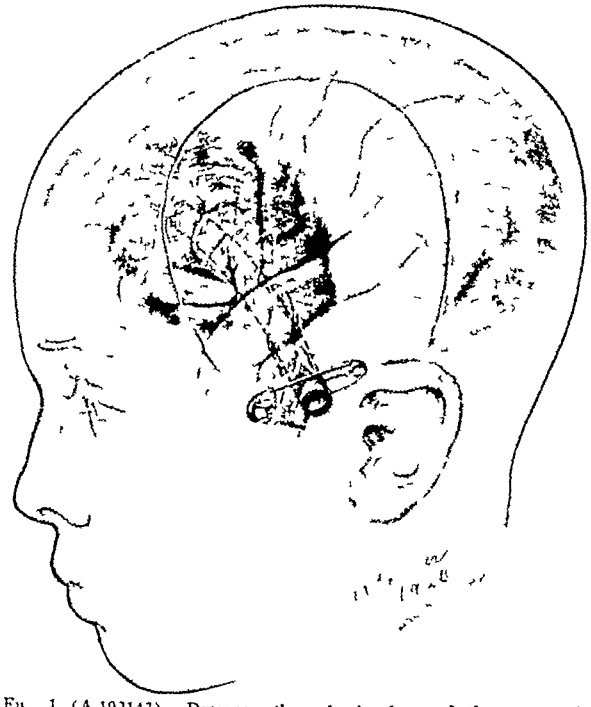

FIG 1 (A 192143).—Drainage through the base of the osteoplastic flap of a large subcortical abscess of the left frontal lobe containing 6 ounces of pus The abscess developed subsequent to an acute otitis media

During the quiescent stage, the abscess usually presents a thickened capsule and the inflammation occasionally quiets down permanently But if the lesion is not operated on, a secondary infection usually develops which stirs up the old process, produces acute encephalitis, and causes death

Holmes[2] found that brain abscess is more likely to occur during the second and third decades of life than during the first, and that solitary tubercles are more common than abscesses in children under 5 years of age

Gowers,[3] in a study of 223 cases of brain abscess, found that 10.7 per cent occurred in patients less than

3 Gowers quoted by Holmes (Footnote 2)

nephritis The average white cell count for the entire group was 16,000, in a few instances the leukocytosis was normal Since the diagnosis was uncertain during

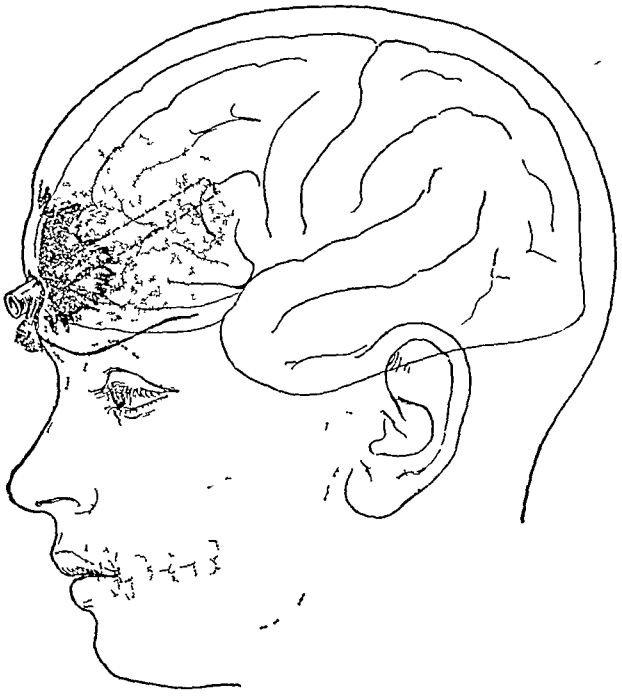

Fig 3 (A 206923) —Drainage of an abscess of the left frontal lobe through a skull defect caused by a kick from a horse The frontal bone was crushed and infected spicules of bone were driven into the brain substance

examination, except for the increased intracranial pressure, the spinal puncture was not done in all cases Whenever the abscess was not associated with diffuse encephalitis or meningitis, the cell count was normal

Fig 4 (A 206923) —Three months after operation (Fig 3) recovery was complete except for a cerebral hernia which has now receded

from two to five lymphocytes to each cubic millimeter In cases of meningitis with brain abscess, the spinal fluid was cloudy and contained as many as 108,000 leukocytes and lymphocytes to each cubic millimeter Spinal fluid and blood Wassermann tests were positive in two of the twenty-six cases, this is interesting in that neither of these two patients had any corroborative symptoms of syphilis Choked disks, ranging from 1 to 7 diopters, were present in nine cases One patient with a fifteen months' history of brain abscess following a frontal sinusitis had a secondary atrophy with total blindness Local tenderness was present in twelve cases, in four it was not over the abscess, but a confirmatory symptom in eight of this group Partial or complete paralysis was present in fourteen cases Fifteen of the twenty-six cases presented symptoms of mental disturbance, such as lack of attention and cooperation, loss of memory, delirium and coma

A resume of the findings reveals urinalysis usually negative, a slight leukocytosis, and if the abscess is unattended with meningitis or cortical encephalitis, a negative spinal puncture One third of the patients

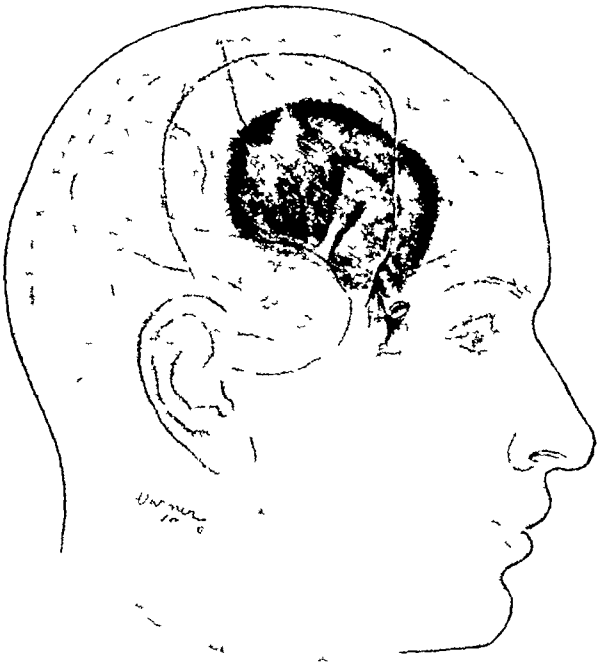

Fig 5 (A 270162) —Drainage of a subcortical abscess of the right frontal lobe through a small decompression at the angle of the wound The abscess, which developed subsequent to a frontal sinusitis was of fifteen months duration and contained sterile pus Patient recovered except for secondary atrophy

studied had choked disks, ranging from 1 to 7 diopters, one third had local tenderness over the abscess, and one half had a motor or mental impairment

The duration of the symptoms varied from three days to three years, and each case followed one of three distinct courses Sixteen patients had an average duration of symptoms of thirty-two days, four of these were operated on for brain abscess and promptly died The five who recovered following a drainage of the abscess had an average duration of symptoms of six months Five patients had an average duration of twenty-seven months, two slowly recovered, and three died, two developed secondary infection and encephalitis, and one received an injury which ruptured an old abscess into the ventricle

The sixteen patients were in the initiatory stage which did not pass into the quiescent stage Those who were operated on and recovered were treated in the quiescent stage when the immunity was the highest

The last five patients fall into the terminal group in which an occasional patient recovers without operation, but the chances are greater that a secondary infection and death will occur

REVIEW OF SURGICAL CASES

Six of the nine patients operated on were explored through an osteoplastic flap, two through a skull defect, the abscess being within close proximity to the site of the injury, and one through a subtemporal decompression, which was not located because of insufficient exposure

A brain cannula was used to locate the abscess, the pus and broken down brain material were removed by suction, the cavity irrigated with saline solution and then packed loosely about the tube drains with iodoform gauze, in one case, tubes without gauze were used In all but one case the pus was very thick and

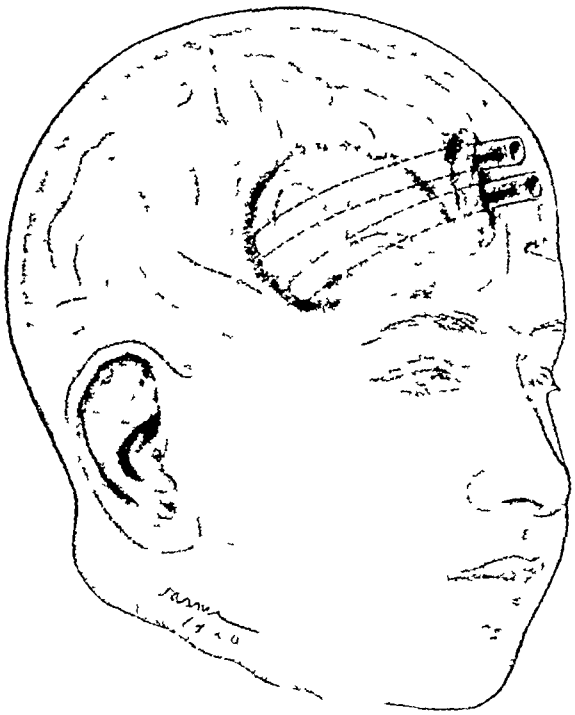

Fig 6 (A 112525)—Drainage of an abscess of the right frontal lobe through a skull defect which was the result of an osteomyelitis following frontal sinusitis

ropey and contained pathogenic organisms, in the one the pus was sterile, this patient gave a fifteen months' history of trouble

RESULTS IN TWENTY SIX CASES OF BRAIN ABSCESS

Patients		Patients	
Operated on (35 per cent. of 26)	9	Not operated on (65 per cent. of 26)	17
Died (45 per cent of 9)	4	Died (89 per cent. of 17)	15
Cured (33 3 per cent of 9)	3	Cured (5 8 per cent. of 17)	1
Improved (22 2 per cent of 9) (with epilepsy)	2	Improved (5 8 per cent of 17) (with epilepsy and slight motor impairment)	1

The convalescent course of the patients, save one, who recovered following the operation, was uneventful This patient developed a local meningitis, osteomyelitis, and infection in the wound, a considerable portion of the skin was destroyed exposing an area of the bone flap 6 by 9 cm This patient presented a very interesting and rather singular picture in that we were experiencing considerable difficulty in stimulating granulation

Fig 7 (A 112525)—Patient ten days after drainage of the frontal lobe abscess (Fig 6) with the drains in place

over the denuded area, when, accidentally, the patient bumped her head and fractured the outer table of the exposed bone, on removal of which the wound healed rapidly, and skin-grafting was unnecessary The principle of this healing is of value in the treatment of exposed areas of the skull in cases of gummatous osteitis, and in denuded areas following traumatic loss of scalp If the sequestrum or outer table is removed, the wound granulates quickly and usually heals without skin-grafting

Fig 8 (A 112525)—Patient had an uneventful convalescence

Another striking feature following drainage of a brain abscess is the rapidity and entirety of mental and motor restoration This may be explained by the fact

that the abscess usually develops within the white substance of the brain with a tendency to expand the part involved rather than produce actual destruction of brain substance, and on drainage of the abscess the cavity collapses, the edema subsides, the circulation improves, and the function returns

CONCLUSIONS

1 The four principal etiologic factors in the formation of abscess of the brain are otitic infection, frontal sinusitis, injury to the skull, and hematogenous infection Brain abscess is usually single, except when it is of hematogenous origin associated with a general pyemia, and then frequently it is multiple

2 A brain abscess in its course may pass through the initiatory, the quiescent, and the terminal phase The different phases can be determined more definitely from the history and duration of the complaint than from the physical findings

3 If the abscess has developed by contiguity, it should be explored through the area of infection, but if the abscess is remote from the source of infection, it should be explored and drained through an osteoplastic flap craniotomy

4 Surgical treatment is of little value in the initiatory or terminal stages, or in the presence of meningitis, but it is of great benefit during the quiescent stage If there is doubt as to the differential diagnosis of brain tumor and brain abscess in the quiescent stage, it is advisable to explore rather than to perform a decompression operation for intracranial pressure or to wait for terminal symptoms

Fig 1—Position of the foot to be gained before one may feel assured that sufficient correction has been obtained, also a simple and efficient method of maintaining correction by the use of adhesive strips

Sugar Consumption in Relation to Health—Any etiologic connection between the increase of sweet eating in this country and the large number of physical defects and functional disorders, a realization of which has come to us through a more thorough examination of schoolchildren and young men, can be only problematic, writes F Van Der Bogert (*Albany M Ann* June, 1920) We know only that these defects exist at a time when general errors in diet are exceedingly common and the natural inference is that some causal relationship exists As suggested by Leonard Williams, 'inasmuch as food is agreeable it is safe to assume that such dietetic errors as are habitually committed arise from excess rather than deficiency of its consumption" Sugar, as the most pleasant, must be considered the most dangerous Dietetic errors certainly have their effect in the production of gastro-intestinal disorders so prevalent in children, and many of the functional nervous disorders of childhood can be directly traced to toxemia of intestinal origin The most frequent dietetic errors in childhood are carbohydrate excesses and sweets are in great part the determining factor in carbohydrate excess

CORRECTION OF CONGENITAL CLUBFOOT IN INFANTS

ISADORE ZADEK, M D
NEW YORK

The most satisfactory age at which to begin treatment of congenital clubfoot (equinovarus) is at the age of 2 weeks This delay adds no material difficulty to the correction, and the treatment is well advanced when the child is old enough to walk, so that only proper supervision is necessary beyond this stage, in the majority of cases In the treatment of congenital clubfoot one should strive not only for correction of deformity, but also for obtaining a relatively normal amount of motion, which can be obtained only by considerable overcorrection of the deformity and maintenance of this attitude for many weeks One must remember that the term "clubfoot" conveys no adequate conception as to the difficulty or ease of correction Correction may be quite simple or extremely difficult, and one can judge of this when the foot is first examined — noting its pliability or resistance to correction As to shape, there are two distinct types the long foot of relatively normal size, and the short, thick, pudgy foot with broadening particularly in the fore part of the foot With the latter type, one always anticipates trouble There is one feature of clubfoot not usually appreciated, namely, that whereas in almost all clubfeet, if proper treatment is instituted early, the deformity may be completely overcome manually and a relatively normal amount of motion in the ankle preserved in the majority of cases These feet do not develop in size as normal feet do, even when their correction has been simple and done early This is evident in the unilateral clubfoot cases in which there is a normal member for comparison, there is lack of muscular development of the entire extremity —which is usually of no practical significance, however

The procedure for correction is to overcome the varus completely before attempting any correction of the equinus, because the normal relationship of the astragalus must be restored before beginning dorsal flexion

This stage of treatment is best conducted by the use of plaster of Paris, changing it at intervals of one or two weeks, a simple method of application being the following Small strips of cotton are placed between the toes and a flannel bandage applied over

this, beginning at the toes, making every turn in the direction of desired correction with this bandage as well as the plaster bandage The toes are first covered with a half dozen turns of the plaster bandage, then as much of the varus as desired is corrected, and the application is continued up to the top of the calf of the leg, with an assistant steadying the bent knee

Fig 2—Method of application of plaster of Paris for right foot Flannel bandage has been applied from toes to top of calf and half a dozen turns of plaster have been applied encircling toes and front of foot—front of foot held in left hand plaster being applied with right.

On the right side, the fore foot caught in the left hand between the thumb on the dorsum and the other fingers around the sole is held in the desired position and the plaster bandage applied with the right hand, on the left side the opposite hands are used, the bandage being applied with the left hand In some of these cases there is a tendency for the child to kick the plaster off, which may be avoided by applying an adhesive strip on each side of the leg and incorporating it in the plaster

After the equinus is overcome, the correction is best maintained by adhesive strips applied across the foot in the metatarsal region and then across the leg as a stirrup first encircling the fore foot It is a good plan to apply a couple of thicknesses of adhesive plaster underneath the strips at the base of the great toe to prevent the edge of the adhesive strips cutting into the skin

Correction should be continued until the dorsum of the foot is against the lower part of the leg, and this position maintained for from six to eight weeks, when it may be discontinued ordinarily When this full correction is obtained, deep wrinkles appear in the skin on the outer border of the foot, which will trouble the mother unless she has been forewarned These later disappear After the adhesive plaster is discontinued, the mother is instructed to put the foot through the full range of motion opposite the original deformity frequently in the course of the day For the average case no splint is necessary The hands of an intelligent parent are more efficient in preventing deformity when the patient is under proper supervision For special cases, retention splints may be necessary When the child begins to walk, it is usually desirable to raise the outer border of the shoe one-fourth inch

After adequate effort, one finds cases in which the equinus cannot be overcome manually after division of the Achilles tendon This is due to short posterior ligaments and not to shortened ligaments, as some believe For these cases it is necessary to cut the posterior ligaments, which may be done subcutaneously [1] We have done a considerable number of these with satisfactory results After sectioning the ligaments, the foot is encased in plaster of Paris in an attitude of calcaneovalgus, and we then treat the foot as though it had been corrected manually, the same after-treatment being essential

This technic has been almost entirely evolved through the efforts of Dr E L Barnett of this city, whom I wish to thank

CONCLUSIONS

1 Treatment of congenital clubfoot should be begun early

2 Treatment should be continued until the dorsum of the foot rests easily against the lower end of the leg, and this position maintained for about two months if there is no tendency to recurrence, as in the average case

3 In the usual run of cases no brace is indicated Too much reliance is placed in the use of clubfoot braces The conventional brace is only retentive and not corrective

4 Frequent daily manipulations, opposite the original deformity, are essential until the correction is assured

Fig 3—Method of application for the right foot Foot held in right hand plaster being applied with the left

5 Many so-called relapses in congenital clubfoot, treated early, are due not so much to the tendency for deformity to recur as to the lack of sufficient treatment

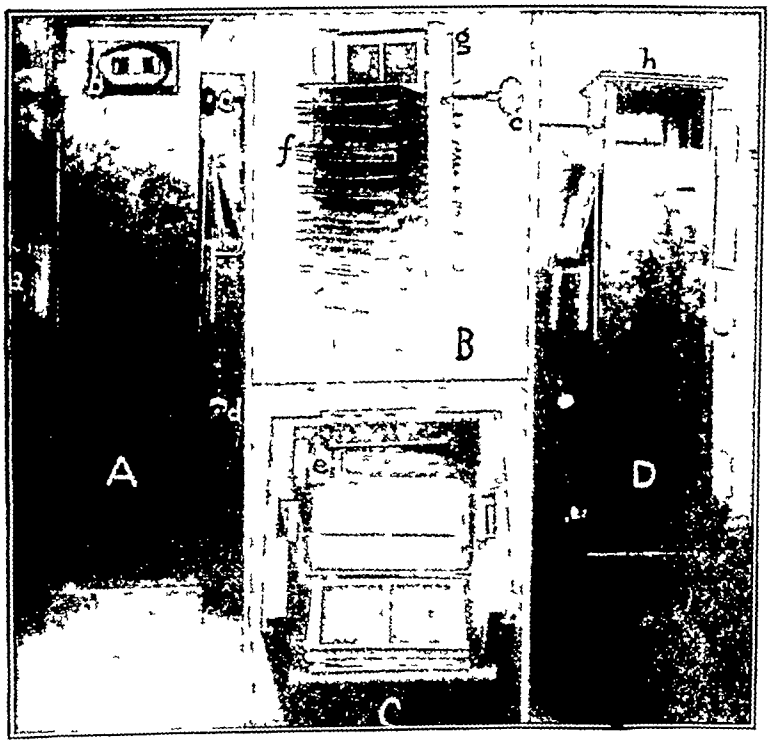
STEREOSCOPIC CABINETS FOR DEMONSTRATION OF ANATOMIC AND PATHOLOGIC PREPARATIONS

ALEXANDER GIBSON, M A, M B CH B, F R C S (ENG), F R S E
WINNIPEG MAN

The value of stereoscopic pictures of anatomic preparations has been recognized for some years Waterston published, in 1906, the Edinburgh Stereoscopic Atlas of Anatomy, consisting of about 250 views Shortly afterward there was published a series of fifty views illustrative of the science of obstetrics Within the last few months there has been published in the United States a stereoscopic work consisting of views of operations as performed by well known exponents

Primarily to meet the needs of a large class of students of anatomy, the apparatus described herewith was designed The idea, however, is one which is capable of being applied indefinitely and individual teachers who may possess some special anatomic dissection, some unusual pathologic preparation or some point in operative technic which they regard as an advantage can easily make use of this apparatus There is nothing novel in the idea, except, I believe, its application to class teaching in the faculty of medicine



Stereoscopic cabinet *A* viewed from front, *B* framework showing views mounted on endless chain *C* lid removed to show lighting arrangements *D* viewed from rear to show portion removed for demonstration of transparencies *a* cards with description of views *b* face piece with stereoscopic lenses *c* handle for turning views *d* plug to fit any socket *e* electric bulb for illumination *f* cards each in a metal carrier, *g* wooden framework, *h* section removed

When an atlas consisting of a collection of photographs is placed in a class room there is always a strong probability that one or more cards will go amiss, they may be lost or be abstracted Further, it is impossible to be certain that the student will replace them in their logical sequence, and time may be wasted in rearranging them These disadvantages are overcome by the use of a demonstration cabinet

The views are mounted in sets of fifty on an endless chain The framework carrying this chain fits into a cabinet, in one face of which is fitted an adjustable face-piece carrying a pair of stereoscopic lenses The chain is turned by handles affixed to a shaft, which is square on section Within the cabinet, above the level of the top of the framework, there is a long, narrow, electric globe By means of reflected light the views are available for study independently of daylight

A modification of the cabinet can be made whereby stereoscopic transparencies can be demonstrated equally well A portion of the side of the cabinet, opposite to the face-piece, is removed, the lid is applied, and the transparencies are looked at by transmitted light

The apparatus was made for me locally Since its installation in the anatomy department of the University of Manitoba, it has been much appreciated by the students

A SIMPLE DEVICE FOR MEASURING BASAL METABOLISM

PRELIMINARY REPORT *

HORRY M JONES, PH D, CHICAGO

The linear formula of Du Bois [1] has made possible very accurate measurement of the basal metabolism of human subjects by what is known as indirect respiration calorimetry

Specially constructed and equipped respiration chambers for measuring the direct heat output are not demanded for diagnostic purposes Briefly, all that is required is (1) measurement of the patient's rate of oxygen absorption per hour, (2) assumption of an average respiratory quotient of 0 82, so as to assign to the oxygen a definite caloric value per liter, (3) calculation of the subject's body area by the linear formula, and (4) from this data calculation of the patient's caloric output per hour per square meter of body area

Formerly, the only device available to clinicians taking advantage of these simple procedures was the apparatus described by Benedict [2] The features of the method as carried out by the Benedict apparatus, which obviously limit its wider usefulness, are noteworthy

1 Although usually known as the "Benedict portable" the fragility of the spirometer bell and necessity for water contained in the apparatus, to say nothing of its shape and weight limit its portability almost hopelessly, so far as carrying the test to the patient is concerned

2 Gas-volume changes from standard barometric to room-barometric pressures, and from 0 C to the various changes in temperature in the spirometer bell, occurring as the test proceeds form only a part of the corrections necessary to the calculations involved in the method Slide rule, logarithms and considerable time are virtually indispensable to the mathematics of the method before the results of the test are known, even after the operator has mastered a knowledge of the mathematical routine

3 An electrical connection for the motor used for circulating the enclosed air is absolutely essential for carrying out the test

The practical accuracy of the apparatus is unquestioned, however when the soda lime is absorbing properly and no leakage of the contained air occurs

The apparatus illustrated in Figure 1, which will be described in detail in a subsequent paper, was designed with the hope of extending the great clinical usefulness of basal metabolism measurements Its simplicity in operation, from the technical manipulations to the final calculations, is a feature which it is hoped will increase its usefulness Its portability however is its chief recommendation It can be

dismounted and put away in a carrying case slightly larger than a microscope case The case, the apparatus and the oxygen cylinder in all weigh 21 pounds The apparatus can be carried in any position, over rough roads, without fear of disturbing its parts or contents, and can be assembled or taken down in about one minute It requires no electrical or other special connection for operation The final result of the mathematics of the test is obtained directly, i e, without any calculation, from a table attached to the apparatus The measurement of the gas volume is independent of temperature and pressure

TABLE 1—TYPICAL READINGS ON SEVEN SUBJECTS *

Subject	Age	Sex†	Basal Rate in Calories per Square Meter per Hour
S T	25	♀	36 5
Wy	26	♀	37 0
J J T	32	♂	39 6
L P G	24	♂	39 2
F G	22	♀	37 5
M W	16	♀	41 0
S P	13	♂	44 0

* These results should be compared with the values given in the table by Aub and Du Bois
† In this column ♂ indicates male and ♀ female

TABLE 2—METABOLIC RATES OF EIGHT PATIENTS *

Patient	Age	Sex	Percentage Rise above Basal Rate. Per Cent
C C H	35	♂	+ 112
H P	47	♀	+ 87
P P	28	♀	+ 51
F C	28	♂	+ 35
W S	52	♀	+ 63
M W	16	♀	0 0
A H	44	♀	+ 26
M P	38	♀	+ 22

* The rates given are those of individuals suffering from hyperthyroidism of varying degrees of severity All of them had been diagnosed as such by Dr Charles S Williamson before being tested The results show the same ranges of variation reported by others in many cases of this disease

For limited space the great advantages of making triplicate readings, of shortening the time to three or four minute tests a discussion of certain trivial sources of error, etc, will be reserved for a later paper Already I have been criticized by clinicians for undue attention to small sources of error Certain it is that, at least for clinical purposes, consideration of ± 2 per cent total error is not of practical value[3]

For illustrative purposes, Table 1 shows typical readings on a few of the many normal subjects who have been tested by this apparatus

Table 2 is a record of the metabolic rates of eight subjects, five of whom had been diagnosed previously by Dr Williamson as frank cases of hyperthyroidism One of the other three, a young girl at the age of puberty, who had been suspected as a beginning case of hyperthyroidism proved to have a rate of 41, which is normal for girls at 16 years, according to the table of Aub and Du Bois From clinical manifestations the other two patients were borderline or suspected cases, a fact which is also well shown in their metabolic rates

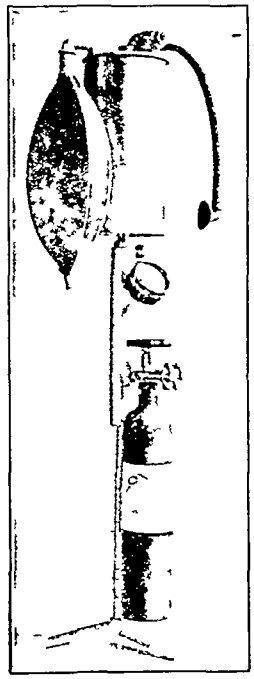

Fig 1 — Appearance of apparatus used for indirect respiration calorimetry height 37 inches weight including smallest size oxygen cylinder (40 gallons) 18 pounds carrying case 13 inches high weight about 21 pounds

A comparison of the results obtained by this device with those obtained by the Benedict apparatus when used on the same subject under the same conditions, showed a rate of oxygen absorption of 288 and 291 c c, respectively per minute In another test, with a second Benedict apparatus, in which the apparatus described here was operated by one unacquainted with this instrument but familiar with the Benedict apparatus, data were obtained which when calculated by another person present at the test gave rates of 45 0 and 44 1 calories per hour per square meter of body area, respectively on the same subject.

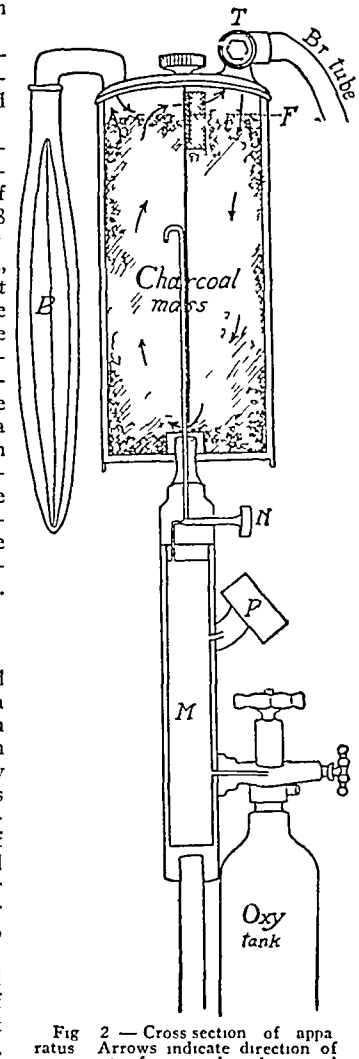

Fig 2 — Cross section of apparatus Arrows indicate direction of movement of inspired and expired air *Br tube* breathing tube *T* three way cock *F* flutter valve for directing circulation of gases *B*, rubber bag to contain measured amount of gas and to allow for expansions and contractions in respiration *N* needle valve for releasing the measured amount of oxygen from *M* the measuring cylinder into the charcoal alkali tower above *P* pressure gage with room temperature scale on dial to indicate when 1 liter of dry oxygen at 0 C and 760 mm has been released at any given room temperature from the oxygen tank

SUCCESSFUL USE OF APPARATUS

The apparatus described here has been used over a period of several months in clinical research and in diagnosis Its portability in a practical sense is demonstrated beyond question Several duplicates of it have also been distributed and are being used for diagnostic purposes, and for following, from time to time the effects of therapy by clinicians and general practitioners, a few of whom, during the last months of its development, have become familiar with the uses and technic of the test So far, no inherent inaccuracies or technical difficulties have been reported from these sources In fact, its technical variations as stated above have already been shown by independent and comparative tests to be well within the limits of individual and physiologic variations, and therefore adequate to the needs of the clinician as an instrument for measuring basal metabolism

UNUSUAL SYMPTOMS CAUSED BY CERUMEN IN AUDITORY MEATUS

REPORT OF CASE

JULIUS KAUNITZ M D NEW YORK

Because of unusual symptoms produced by such a trifle as cerumen in the auditory meatus I have thought it worth while to report this case

Mrs W aged 73 with unimportant family and personal history, suffered from nausea vomiting diarrhea vertigo and weakness of twelve hours duration July 17 1920 These symptoms the daughter ascribed to ptomain poisoning resulting from some food of doubtful merit ingested the day

3 The assumption of a respiratory quotient of 0 82 has abundant experimental justification and apparatus for the determination of the respiratory quotient in each individual case is wholly superfluous especially in diagnosis or in clinical research

before The diarrhea I suspected to be caused by a purgative taken on the previous evening

The patient was well nourished The thoracic and abdominal organs and extremities were apparently normal The patient was lying on her right side An attempt to turn the head to the left immediately brought on the most distressing giddiness, nausea and weakness The sitting or standing position could be maintained only with the greatest effort, and always with the head and body inclined to the right Her walking was of a staggering nature It was necessary to hold on to objects for support There was a distinct lateral nystagmus when looking to the left, but not when looking to the right The patient denied any recent ear trouble, deafness or any unusual sounds or sensations in the ears Examination of the ears, however, disclosed a thin disk of ear wax a quarter of an inch in front of the drum When this disk was punctured, there was an immediate relief from all the distressing symptoms The patient could now turn her head to the left, sit, stand or walk as usual The nystagmus had disappeared

Special Article

OBSERVATIONS ON SOUTH AMERICA

IV ARGENTINA

WILLIAM J MAYO, M D
ROCHESTER, MINN

Argentina is readily accessible from Chile by the Transandean railway The frontier is reached at a height of about 3 kilometers above sea level, at which point the railway tunnels its way through 4 kilometers of mountain range underneath the old pass The railroad follows the Rio Blanco River on the Chilean side by a very sharp ascent and many windings, often uncomfortably close to the edge of the narrow ledge on which it is built On the Argentine side the descent to the pampas or great alluvial plains which extend from the foot of the Andes approximately 800 miles to the sea is less abrupt, and follows the cañon of the Mendoza River

At least a third of the nine or ten million people of Argentina live in cities, more than a million and a half in Buenos Aires alone The country is very fertile, naturally without trees, but eucalyptus, Lombardy poplar and weeping willow trees have been planted freely in certain districts The land resembles that of the Dakotas, and is farmed in very large tracts or estancias The land owners have become enormously wealthy Blooded cattle may be seen in herds of many thousands Argentina, with its rich lands, situated largely in the temperate zone, will eventually become the United States of South America

The railroad system in Argentina is excellent, the equipment and management are on the continental plan Buenos Aires, which of late years has been controlled by the radical party, dominates the country politically Laws controlling the disposition of property on death, to break up the large estates, have been passed recently Strikes are initiated with or without reason, and industrial disturbances are constantly occurring Recurring longshoremen's strikes have seriously interfered with shipping for a long time, and grains, hides, wool, sugar, cotton and many other of the world necessities have accumulated in Argentina during this period Numerically the Italians are the dominant race The Spanish, English, French, German and American colonies are relatively small

Buenos Aires is a beautiful city, the Paris of South America Its gardens, parks, sidewalk cafes, boulevards, statues and ornate buildings give it a charm that is all its own There is a public lottery system in Argentina, and the profits are used for charities Horse racing is the national pastime, and in this sport Argentina leads the world The Jockey Club is controlled by the government, but is privately managed The betting is princely, thousands of dollars are lost and won each racing day Little attempt is made to control the liquor traffic

The general standing of education in Argentina is high The primary course is five or six years, depending on the ability of the student, and is compulsory Argentina has 400 schoolbuildings on the American plan, most of them modern and completely equipped, including lunch rooms, where bread and sterile milk are served the pupils without charge The second course is six years, but is not compulsory Modern languages are taught in this course, and the pupils are not considered "educated" until they have acquired at least three, at the present time Spanish, French and English One unique feature of the university system in Argentina is the method of control One third of the votes are in the hands of the full professors, one third in the hands of the junior professors and instructors, and the remainder with the students Strikes by the students are not infrequent, and all classes are suspended until a settlement is reached It is difficult to obtain an unprejudiced opinion of this innovation in Buenos Aires, but it may at least be said that it is popular with the students The day we visited La Plata University the medical students were on a strike Even in the primary schools, strikes are frequent A recent student strike of pupils under 10 had to be settled on bended knees, the parents furnishing the knees and the shingle

The chief medical school of Argentina is located at Buenos Aires and is a part of the university The building is a dignified structure and occupies two city blocks The school has an enrolment of 5,000 students The course is seven years, but is so rigid, particularly in theoretical branches that only about one fourth of the students graduate in this time Many spend eight, nine or even ten years obtaining their degrees Approximately two of the seven years, however, are spent on physics and chemistry, studies that are premedical in North America Public health, dentistry and veterinary medicine are under the direction of the medical school Premedical courses in anatomy, chemistry and the fundamental branches are also given at the La Plata University, about 40 kilometers from Buenos Aires The Department of Anatomy at La Plata, under the direction of Dr Pedro Belou, is unusually good I was much interested in some researches in human and comparative anatomy of the liver and gallbladder which he had under way The museum of

natural history of La Plata is said to be the finest in South America, and we spent a half day with the curator, the venerable Professor Quevedo, observing its wonders The anthropological collection is unique

Many of the thirty hospitals in Buenos Aires are old, but practically all are in a process of reconstruction along modern lines The hospitals have high ceilings, large window spacing, verandas and gardens, well suited to the tropics, but they are not screened Trained nurses, as we understand the term in the North, do not exist in South America There is only a small middle class from which to draw material for nurses, it is obviously impossible under present conditions to obtain students from the cultured class qualified for such work However, the general average of education is being raised, and new training schools are being established with American nurses in charge The records in all the hospitals are extraordinarily good Few hospitals in America can show records equally well kept

Almost all the hospitals and charities in Buenos Aires are financed by the Woman's Benevolent Association, which collects and dispenses funds The municipal authorities are said to be very jealous of this organization, but it is so strong, and the money is so well administered, that no real objection can be filed against it

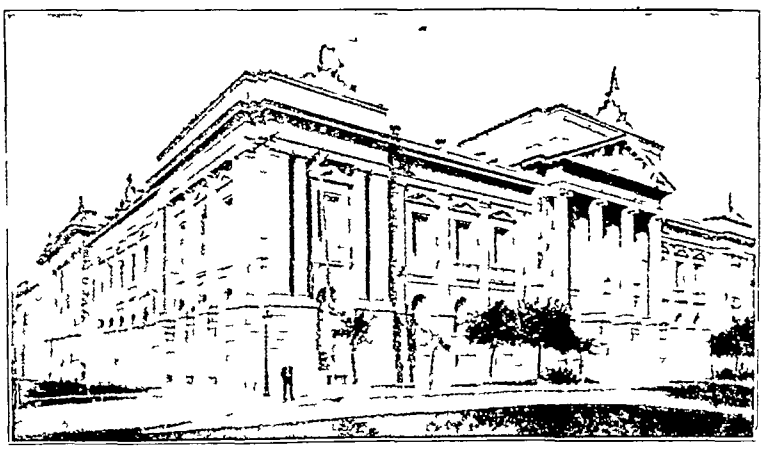
The Rivadavia Hospital occupies almost an entire block of land and is divided into medical, surgical, gynecologic and maternity departments In the museum of the latter are many rare and well preserved specimens, as well as a very complete and well selected teaching collection In the department for children is a fine infants' clinic

The new medical hospital is under the direction of Dr Agote Its organization and its records are models of excellence Clinical work and investigation of the most extensive and advanced character is being carried on Dr Agote was the originator of the citrate method of blood transfusion and has perfected the technic of the procedure A detailed description cannot be given of all the important features of this institution, but the American student of internal medicine who arranges to spend a year with Professor Agote will, indeed, be fortunate

The British Hospital in Buenos Aires has 200 beds Dr O'Connor, senior surgeon, well known in the United States by his frequent contributions to American surgical journals, and Dr Robert Hallahan, are the surgeons in charge Dr Hallahan, the junior surgeon, was educated in Ireland about twenty years ago After coming to Buenos Aires he passed the examination given in Spanish He is quite American in his methods Many Americans go to this hospital when they are ill

One of the most respected of Buenos Aires' notable surgeons is Herrera Vegas, a man of great wealth and philanthropy, and an inspiring influence for good in the medical profession Dr Vegas speaks four languages fluently He has contributed to literature several monographs on special surgical subjects, and in conjunction with the eminent surgeon, Dr Cranwell, is now preparing an important work on hydatid disease The chapter devoted to hydatids of the lung will be particularly interesting A large number of these cases were seen in the several hospitals Hydatid disease is very common in South America, and is thought of whenever a patient presents unusual symptoms When these cysts occupy the lungs, the fluid can be agitated by motion and the waves can be reproduced in moving pictures Dr Vegas has one of the finest private libraries in South America

Dr Pedro Chutro, one of the professors of surgery at the Medical School, is well known in the United States He served with the French during the Great War in charge of a large hospital in France, and it is generally conceded that his work was not excelled by that of any other surgeon At the close of the war he was requested to go to New York to demonstrate in the military hospital there his original methods of dealing with old infected compound fractures with osteomyelitis Professor Chutro was decorated by the United States with the Distinguished Service Medal, he is one of the few foreign surgeons to receive this honor Dr Pasman, one of the professors of surgery in the Medical School, is also well known in the States All the surgical work we saw in Buenos Aires was good, and carried out with characteristic skill and precision The surgeons of Argentina compare favorably with those of any other country in the world



School of Medicine Buenos Aires

Progress in Health Work.—Towns, cities and states are beginning to realize that the cheapest form of health insurance may be obtained from well organized and efficiently operated health departments The demand for trained public health workers has grown so rapidly that it now greatly exceeds the supply The call for public health nurses alone is so great that several years must elapse before enough women can be trained in the work to supply the communities now calling for the essential service which only a public health nurse can furnish—*Connecticut Health Bull* December 1919

ORGANIZED VS INDIVIDUAL EFFORT IN RESEARCH

In his presidential address delivered at the Cambridge meeting of the British Medical Association, Sir Clifford Allbutt [1] pointed out the complexity of disease and the great advantage that has accrued to research by approaching the problems from a comparative standpoint To proceed in this way, however, requires a breadth of intellect and a wealth of observation and analysis that are ordinarily beyond the possibilities of the individual Hence Sir Clifford argues for the organization of investigation on a larger scale commensurate with the needs of such a comparative survey, in which many intellectual forces may combine to work toward common ends At the present time, says Allbutt, "no one stirs, save to gyrate each in his own little circle There is no integration, no organization of research, no cross light from school to school, no mutual enlightenment among investigators, no big outlook" "Diseases," he continues, "are not 'entities,' nor even recurrent phases of independent events, but partial aspects of a universal series The young graduates we have, many of them of great capacity, but every day we are losing them because they are not taken up at once into scientific teams, so they slacken, or drift into some other means of livelihood, and things muddle on as before How blind we are!"

No one will gainsay the wisdom of much of this advice The organization of scientific effort, the team play of scientific workers, during the World War illustrates well what can be accomplished in speeding up the development of new ideas, if not their actual creation It is doubtless true that two heads are better than one But in our modern enthusiasm for organization we are in danger of forgetting that system and survey and encyclopedic knowledge can never supplant real thinking Thinking is, after all, an individual performance Companies or groups of persons do not think together or devise or invent anything or any process except so far as they put together—organize, compare—the products of individual human minds

This is, perhaps, an opportune moment to sound a note of warning lest we become blind to the limitations of organizing investigative effort It is likewise a favorable time for uttering a plea for the individual worker in science He must be encouraged, not merely permitted, to unfold his own personality—his own point of view and perhaps even his seeming eccentricities of mind He must be permitted, at all events, to preserve the open mind rather than to be biased by the projects of a company of scholars A league of investigators might promote lasting benefits to the world No one would expect it to make a scientific discovery Let us by all means facilitate the progress of science by furnishing the requisites for research by organized effort to promote the aims and set forth the results, by systematic planning and cooperation which will make established facts easily available and widely known Let us increase the number and variety of national or even international institutes if there is prospect of intellectual, social or economic gain thereby But amid this growth of the get-together spirit and better intellectual community let us always bear in mind the individual who does the thinking We need not be blind to the need of integration in science, we must not be forgetful of the man Genius is found in men, not in organizations

A PUBLIC HEALTH PROBLEM IN THE PHILIPPINES

In 1908, Garrison [1] thus summarized his experience in the study of alimentary conditions in our insular possessions

> The population of the Philippines presents a higher percentage of infection with intestinal worms than has ever been definitely reported from any other people and the condition is essentially a chronic one the results of which manifest themselves indirectly in the general physical impoverishment of the people and the high rate of morbidity and mortality accredited to other diseases

This statement was highly significant from the standpoint of public health, even more surprising, however, was the finding [2] of intestinal parasitism in virtually all of a large number of children whose feces were carefully examined It is, of course, recognized quite generally that infestation with some parasites, such as pinworms (oxyuriasis) and eelworms (ascariasis), is likely to be more common among children than among adults, but these Philippine records for the young were almost overwhelming in their import and raised many serious questions

A decade later finds the conditions just referred to essentially unaltered In a report from the Bureau of Science at Manilla, Haughwout and Horrilleno [3] register as the outcome of an examination of 100 sick

1 Allbutt T C Universities in Medical Research and Practice Brit M J 2 1 (July 3) 1920

1 Garrison P E. Philippine J Sc. B 3 73 1908
2 Garrison P E and Llamas R The Intestinal Worms of 385 Filipino Women and Children in Manila Philippine J Sc B 4 185 1909
3 Haughwout F G and Horrilleno F S The Intestinal Animal Parasites Found in One Hundred Sick Filipino Children Philippine J Sc 16 1 (Jan) 1920

children in the Philippine General Hospital that ninety-two were parasitized The earliest case of parasitism was encountered in a child of 7 months, under 1 year of age the incidence was 67 per cent , all children between the ages of 2 and 13 years were found to be parasitized The organisms recorded lie in thirteen genera and as many species The whipworm (*Trichuris trichiura*) was the most prevalent parasite, followed closely in frequency by *Spirochaeta eurygrata* and the eelworm (*Ascaris lumbricoides*) No evidence of cestode or trematode infection was discovered No protozoon of proved pathogenicity, like *Endameba histolytica,* was encountered, thus suggesting a possible immunity in children Multiple parasitism was quite common The observed combination of pinworm and eelworm cannot fail to be objectionable, because the entire alimentary tract becomes involved thereby

It must be frankly admitted that aside from infestation with notably pathogenic intestinal parasites like the hookworm, no definite pathologic symptoms are at present referable to the presence of the other species Is this widespread parasitism then to be regarded as without import for childhood and growth? Does the ignorance of definable harm justify an attitude of indifference on the part of pediatricians? It may be well in this connection to review the possibilities of detriment that might be ascribed to the supposedly innocuous invaders They may, to quote the Manila protozoologists, produce substances directly toxic, cytolytic or hemolytic, their products of metabolism may be harmful, when present in large numbers, parasites may injure mechanically the mucous lining of the alimentary tract, they may aid in the transport of pathogenic organisms, they may interfere seriously with the absorption of digestive products by their actual adherence, as in the case of *Giardia,* to the epithelial surfaces, and the parasites may occasion an actual invasion and destruction of the tissues with all the sequels

This is, indeed, a formidable array of objectionable possibilities, even when the indictments are not yet proved for the individual cases It would surely seem as if a serious problem were offered to practical pediatrics by the findings among the Filipino children One cannot dismiss the suspicion that intestinal parasitism directly or indirectly contributes heavily toward the high death rate among them The parasitism starts coincidently with artificial feeding, but even breast-fed children are not exempt in all cases Children are everywhere notably indifferent to sanitary laws, and when to this indifference is added the existence of a highly insanitary environment, the problem of prophylaxis becomes almost insuperable There is no treatment of proved efficacy against the whipworm, *Trichuris,* and the eggs of this organism remain viable for years Hence we can understand Haughwout's note of despair when he writes "One can picture the extent of the 'clean-up' process that would be required to purge a community of *Trichuris* alone, a job that would make the hookworm campaign seem like child s play in some respects" But preventive medicine has become accustomed in these days to tackle big jobs

THE RÔLE OF DIET AND EXERCISE IN ANTISYPHILITIC TREATMENT

Carefully conducted observations on syphilitic patients have indicated that considerations of diet and exercise may deserve greater attention than is customarily regarded as requisite for the uncomplicated success of antisyphilitic treatment The occasional appearance of more or less grave signs of intoxication after administration of preparations of arsenic and mercury or both is familiar to all who deal extensively with syphilitic patients Sometimes the symptoms even resemble those of acute yellow atrophy of the liver, while jaundice is of common occurrence Bailey and MacKay,[1] working in the Ontario Military Hospital, Orpington, Kent, have discovered that in patients whose livers are damaged by arsphenamin derivatives, an increase of cholesterol in the blood is an early and marked sign, it persists after other clinical signs have disappeared As hypercholesteremia was found in nearly all of the toxic cases, they suggest, therefore, that routine estimation of blood cholesterol may furnish a valuable sign of a precarious state of the liver in persons under antisyphilitic treatment

With respect to the values for the urea content of the blood, it appears that although some patients furnished normal figures, in the majority they were above normal According to the Canadian investigators this was due to the high nitrogenous diet, including 150 gm of protein a day, and to insufficient physical restrictions placed on the soldiers under observation The blood figures were usually more favorable when rest was rigorously enforced

It is known that diet plays a part in the ease of recovery from the effects of delayed poisoning by various drugs, including phosphorus and chloroform, which have been investigated extensively under experimental conditions For example, Davis and Whipple,[2] who have studied liver damage and repair in dogs poisoned by chloroform, noted that sugar and diets rich in carbohydrates, fed in the days preceding chloroform anesthesia, exert a marked protective action against liver injury Fats alone, or combinations of food containing fat in large proportion, induce a maximal susceptibility to liver injury Skim milk alone is highly protective A diet of bread and skim milk or any rich carbohydrate diet gives the optimal liver repair A diet of cooked skeletal muscle is not favorable for rapid liver repair

1 Bailey C V., and MacKay Argus Toxic Jaundice in Patients Under Antisyphilitic Treatment Arch Int Med 25 628 (June) 1920

2 Davis N C and Whipple G H The Influence of Fasting and Various Diets on the Liver Injury Effected by Chloroform Anesthesia Arch Int Med 23 612 (May) 1919

If the possibility of damage comparable with "delayed poisoning" in chloroform anesthesia occurs in medication with arsphenamin and related products, we agree with Bailey and MacKay that it would seem advisable in the treatment of syphilis to institute a rich carbohydrate diet low in fat and protein This diet should precede the treatment by several days and should be continued throughout its full course The effects of increase of protein in the diet and of exercise might be controlled by the estimation of urea in the blood At any rate, the consideration of diet in this chapter of medicine constitutes a therapeutic novelty

THE NATURE OF THE FAT-SOLUBLE VITAMIN

The discovery of the dietary importance of that property of many foods which is now termed fat-soluble vitamin or fat-soluble A represents a contribution of American physiologists [1] to the science of nutrition It has been repeatedly verified both in this country and abroad According to the observations made on a variety of experimental animals, the lack of the fat-soluble vitamin in the diet during adolescence may lead to an inhibition of growth together with symptoms of decline in health Most conspicuous in a specific way is the apparently increased susceptibility to bacterial infection In the case of rats this lowered resistance first betrays itself in many instances by the appearance of a characteristic disorder of the external eye which has provisionally been classed as a xerophthalmia It usually begins with a swelling of the lids which is followed by an inflamed and catarrhal condition of the conjunctivae This rapidly becomes worse, and the discharge, which is at first hemorrhagic, frequently becomes purulent If untreated, the cornea may become involved and total blindness result If a food containing fat-soluble vitamin is administered, the symptoms usually clear up in a few days without further treatment, and growth is resumed The same phenomena have been observed in mice, and more recently in rabbits kept on diets poor in the fat-soluble vitamin [2] A possible relation of the lack of the latter to the occurrence of phosphatic calculi has also been pointed out by Osborne and Mendel [3]

Whether and in what manner a dietary deficiency in fat-soluble vitamin plays a part in human disease remains to be ascertained The probability of the need of this food accessory in the ration of man is large and the possible dire effects of a lack of it are being discussed widely at present, notably in relation to the pathogenesis of pellagra, rickets and xerophthalmia in childhood The fact that many fats, such as lard, vegetable oils and hydrogenated fats, which have found widespread use in the dietary of man in recent years, are virtually devoid of fat-soluble vitamin has caused some concern owing to the relatively high cost of those fats, like milk fat and egg fat, which are rich in it It is a relief to know, however, that the fat-soluble vitamin has a far wider distribution in nature than the earlier studies led physiologists to suspect Only recently the researches of McCollum, Steenbock and their collaborators at the University of Wisconsin,[4] and of Osborne and Mendel [5] in New Haven, have indicated the richness of many sorts of plant tissues in all familiar types of vitamins, thus placing the dietary importance of "vegetables" in a new light

In commenting on this information, Osborne and Mendel remark that it emphasizes the use of vegetables to supplement the refined foods of the modern food industry which furnishes products rich in proteins, fats and carbohydrates, but in many cases comparatively deficient in the vitamins The newly acquired facts, they add, serve as a further reminder that the fat-soluble vitamin need not be sought solely in foods known to be rich in fats Fat-soluble vitamin has never been isolated, nor has it been concentrated in any way which avoids the simultaneous presence of ordinary fats, to some extent at least Although its reactions and behavior toward solvents suggest a lipoidal character, Steenbock and Boutwell [6] have demonstrated that the fat-soluble vitamin resists saponification with alkalis whereby true fats are converted into soaps Hence it can scarcely be regarded as identical with fats This fact, for which some evidence had already been available, represents a distinct step in advance in the study of vitamins

The extracts containing fat-soluble vitamin as obtained from natural products are invariably colored Yellow corn is richer in fat-soluble vitamin than is white corn, there is a similar contrast between colorless lard and the yellow milk fat and egg fat Hence Steenbock has advanced the theory that the vitamin may be a yellow pigment or at any rate a closely associated substance His latest contribution is corroboratory, it also indicates that the vitamin attends the carotin rather than the xanthophyll variety of pigments, either or both of which may represent the yellow col-

oring matter in animal and plant foods These findings, if they are further substantiated, mark a distinct step in advance toward the goal of discovering the nature of the fat-soluble vitamin

Current Comment

PIE AND DIGESTION

There is a widely current slang expression which bewails the depressing circumstance that "somebody is always taking the joy out of life" Many Americans have become wedded early to an outspoken liking for pie, that typical national pastry The predilection for this article of diet seems to grow with the years Sooner or later, however, the aforesaid somebody, who is more than likely to be a member of the medical profession is certain to issue a note of warning against the alimentary dangers that lurk in pie Cake, the distant pastry relative, is somewhat less likely to form the subject of objections from the physiologic critic, while puddings usually belong to the immunes, or at least receive tolerant consideration The proof of the pudding—and why not also of the pie—is the eating Accordingly, a number of gastro-enterologists [1] at the Jefferson Medical College, Philadelphia, have come to the defense of pie by actually determining the gastric response to it and analogous foods in the healthy human stomach Direct comparisons of a variety of pies, cakes and puddings representative of American culinary art, on the same persons, indicated that pies "were handled more readily than cakes, and puddings somewhat more readily than either" For those who can think best in terms of statistics, it may be stated that the average gastric evacuation time of puddings was two hours and eighteen minutes, against two hours and twenty-seven minutes for pies, whereas cakes followed in the wake with an average record of three hours and two minutes Averaging the highest total acidities, values were obtained for puddings of 92, for pies of 90, and for cakes of 90 Some of these values are not widely divergent from the classic data obtained on Alexis St Martin, whose stomach permitted Beaumont to make his pioneer investigations in gastric digestion There is no occasion to report here the insignificant distinctions between custard pie and lemon meringue, for example, in their gastric behavior, but it must be admitted that mince pie, so often regarded as an arch offender of the digestive tract, requires a rather long time (from two and three quarters to three and one quarter hours) to leave the stomach The addition of ice cream to a piece of pie—a unique American combination—does not increase the burden of the stomach to any extent, and the conventional apple pie and cheese likewise give a conservatively good report To a few persons it may be a consolation to know that angel's food cake remained distinctly longer in the stomach than did devil's food cake Of course, gastric evacuation is not the sole, complete test of the dietary worth of a food

VALUE OF THE SCHICK TEST IN RELATION TO DIPHTHERIA

The importance of the Schick test as an index of antitoxin immunity to diphtheria ought to be familiar to physicians However, the recrudescence of Fourth of July casualties, to which attention was recently called in THE JOURNAL,[1] teaches clearly that it is human to forget easily Therefore the significant lessons of modern preventive medicine need and deserve to be reiterated again and again so long as they are likely to lead to public benefit The Schick test, which can be applied with great ease to large numbers of persons, makes it possible to differentiate those immune from those susceptible to diphtheria, and it also facilitates the attempt to increase the number of the immune by suitable prophylactic toxin-antitoxin injections The testimony as to the value of the test is already fully convincing Blum [2] recently demonstrated what can be accomplished in a large home for infants where diphtheria had been endemic as late as 1915 When it was ascertained by the Schick test that 37 per cent of the inmates were susceptible to the disease, attempts were made to establish an immunity in this group How successfully this was accomplished, through injection of those susceptible, is shown by the result that the same institution has been rendered diphtheria free during the last five years The outcome with more than a thousand children shows, furthermore, that a negative Schick test is evidence of the presence of sufficient antitoxin in the body to protect the individual against infection with diphtheria Changes in the Schick reaction from negative to positive during the first three years of life owing to the loss of inherited immunity, were found by Blum to be sufficiently numerous to justify retesting, at least in large institutions, during this period at intervals of a few months The duration of the active immunity conferred at different ages on persons susceptible to diphtheria, by injection of toxin-antitoxin mixtures, remains to be ascertained with greater precision In young children the duration presumably lasts far longer than two years The lesson is obvious

THE PHYSICIAN'S OFFICE

The people have money and they are spending it But, like the woman who bought the pair of silk stockings, they want something to show for it With incomes anywhere from $8 to $15 a day, the bricklayer who buys a flivver, the cap maker who has a fur coat, the tailor with season tickets for the opera, are able to pay good fees to their physicians But they want the best, and the physician should equip himself to give it to them The physician who plods along in shabby quarters, dependent wholly on his five unaided senses for diagnostic ability, his only reference works some dilapidated textbooks of a previous decade will not suit the taste of the new type of wage earner

ALABAMA

Fire Destroys Sanatorium.—White's Sanatorium Enterprise, has been destroyed by fire at a loss of $30,000

Memorial Cornerstone Laid—The cornerstone has been laid for the Soldiers' Memorial Hospital, which is being erected in Montgomery, and will cost about $100 000

New Quarantine Plant Needed—The Surgeon-General of the U S Public Health Service appreciating the need for a new quarantine station at Mobile, has recommended that an appropriation of $400,000 be made for this purpose

Convict Camp Abandoned—Abandonment of the Mobile County Convict Camp, Mobile, which has been stigmatized as a 'health menace,' by the state prison inspector, was ordered by the board of revenue and road comissioners, August 2

GEORGIA

Medical Examiners Needed—The Federal Board for Vocational Education, Atlanta, announces that it desires to employ a number of physicians as field examiners for disabled exservice men for three months or longer, at a salary of $220 a month and necessary expenses when traveling in the field Application should be made to Dr Clarence S Merriam, District Medical Officer 814 Forsythe Building, Atlanta

Dr Long to Be Honored—The memory of Dr Crawford W Long, Athens is to be commemorated at the University of Georgia by a bronze medallion to be placed in one of the university buildings through the generosity of Joseph Jacobs Atlanta The board of trustees has accepted the offer and has appointed a committee to arrange for the presentation ——An appropriation for a statue of Dr Long in the Capitol Building, Washington D C will be asked of the state legislature by the Medical Association of Georgia Dr Garnett W Quillian Atlanta, is chairman of the committee appointed for this purpose

Personal—Dr Harry Moses Macon while performing an operation at a hospital was stricken with appendicitis and underwent operation at the Macon Hospital, July 24——Dr Robert A Herring, Milledgeville, has been made health officer of Wilmington N C, and entered on his new duties July 20 ——Dr Richard L DeSaussure Atlanta, commissioner of health of Floyd County, has resigned to accept a similar position at Brunswick Glynn County——Dr R W Todd Brunswick has resigned as commissioner of health of Glynn County to accept a similar position in Marietta Cobb County ——Dr Hollis F Hope Lafayette, has resigned as commissioner of health of Walker County and Dr Joseph H Johnson Millan has been elected in his place

District Society Meetings—The annual meeting of the Seventh District Medical Society met in Dalton as the guest of Whitfield County Medical Society July 8 It was unanimously decided to appoint a committee to raise funds for a suitable memorial to Dr Robert B Battey Rome Rome was selected as the next place of meeting and the committee named to select the Battey memorial was directed to erect it between this time and the date of the meeting of the state medical association which convenes in Rome next summer Dr Howard E Felton Cartersville was elected president, Dr Charles F McLain, Calhoun, vice president and Dr Mather M McCord, Rome secretary-treasurer——The midsummer meeting of the First District Medical Society was held at Savannah July 15 and the following officers were elected president Dr Charles Usher Savannah, vice presidents Drs J O Strickland Pembroke, and James O Baker, Savannah and secretary-treasurer, Dr B M Bishop Savannah

ILLINOIS

Field Day—A field day is to be given to all members of the Chicago Medical Society and their families by the North Side Branch of the society on the grounds of the St Marys Training School near Desplaines Wednesday, September 15

Negro Physicians Purchase Hospital.—An association of colored physicians of Chicago of which Dr Benjamin R Bluitt is president and Dr Fred C Cade secretary, has purchased the Fort Dearborn Hospital and Training School for Nurses at 3831-3835 Vernon Avenue

Hospital Projects Unite—Urbana has abandoned its hospital project and by a vote of the board of directors will join hands with the board of directors of the Julia F Burnham Hospital Champaign, in making a success of the forthcoming drive for $175 000 to remodel the present building and erect the first unit of a new hospital

Hospital Buildings Chartered—The secretary of state has granted charters to St Elizabeth's Hospital, Belleville, St Francis' Hospital Litchfield, St Clara's Hospital, Lincoln St Joseph's Hospital Highland, and St Anthony's Hospital, Highland These hospitals are conducted by the Sisters of St Francis and are affiliated with St John's Hospital, Springfield, and a number of others in Illinois and adjoining states

Organization Plans—The organization committee of the Chicago Medical Society has asked the presidents of the various branches of the society to call a preliminary meeting this month to consider the following matters important pending legislation unusual action of osteopaths, chiropractors naprapaths Christian scientists and other pseudo-health cults dangers of socialized medicine to the public as well as the profession, and changed economic standards and the inadequacy of medical incomes

Hospital Committee Meets—The committee on medical education and hospitals of the Illinois Medical Society and representatives of the Illinois Hospital Association and of medical colleges met at the Sherman Hotel Chicago, on Friday August 13 to discuss the eligibility of hospitals for the training of interns It was determined that hospitals should have at least twenty-five beds, organized staffs complete histories and records, laboratories for routine clinical, microscopic pathologic and bacteriologic work, complete roentgen-ray departments, expert instruction in anesthesia, instruction in obstetrics, and definite rules in regard to the duties and privileges of interns

IOWA

Gives Library to State—Dr Albert A Anderson Des Moines has presented his medical library of 300 volumes to the state library in the Historical Building Des Moines

Typhoid Fever in Pella—On July 14 forty-three cases of typhoid fever were reported in Pella and D S Griswold the state epidemiologist has been sent to Pella to investigate and to take charge of the situation The source of infection has been traced to an infected well which was in general use

Personal—Dr Robert E Jameson Davenport who has been seriously ill in Marcy Hospital is reported to be improving——Dr Frederick L Appel Muscatine who has been seriously ill is reported to be convalescent——Dr Oliver G Winters, Des Moines, has been appointed chief medical director for the Yeomen of America succeeding Dr Charles F Smith Des Moines

LOUISIANA

Permit Revoked—The permit of Dr Anthony J Monty New Orleans to sell drugs is said to have been revoked recently

Appropriations Increased—The appropriation for the state board of health for relief and emergency work has been increased by the legislature from $60 000 to $75 000

To Aid Drug Addicts—The Louisiana State Board of Health has decided to arrange for a special section of the Charity Hospital of New Orleans to be devoted exclusively to the treatment of drug addicts

MICHIGAN

Dean Resigns—Dr Wilbert B Hinsdale Ann Arbor for quarter of a century dean of the Homeopathic School of the University of Michigan has resigned

Dr Case Honored—The July issue of the *Welfare Bulletin*, published by the Battle Creek Sanitarium Welfare League is devoted almost entirely to the war story of Dr James T Case interestingly told and profusely illustrated

State to Take Over Tuberculosis Clinics—Arrangements have been completed whereby the state department of health will take over the free tuberculosis clinics and the tuberculosis work among former service men hitherto conducted by the state antituberculosis association

Smallpox.—On July 17 it was reported by the Detroit Department of Health that smallpox was five times as prev-

alent as is customary at this season Since April 28 the vaccination squads have examined 34 900 people and vaccinated 6,930 About 20 per cent of the individuals examined were considered to be unprotected against smallpox

Health Budget—The budget of the Detroit Department of Health for 1920-1921 allows $1 020 570 for the maintenance of the department, or $1 03 per capita as compared with 95 cents in the previous years' budget Expenditures of $25 000 for plans for a new city general hospital, and of $1 579 800 for the construction of a 300-bed tuberculosis sanatorium have also been allowed during the last biennium

Combating Typhoid—The state health department has purchased a motor truck, equipped as a laboratory, and is touring the summer resorts of the state testing water, milk and sewage at each resort visited A bacteriologist and sanitary engineer accompany the truck and Dr C C Young director of laboratories of the department, is giving several special lectures to summer school students and others The first appearance of the truck was at Adrian, July 19

MINNESOTA

Alterations at City and County Hospital—Plans have been prepared and bids solicited for extensive alterations and repairs at the Minneapolis City and County Hospital

Village to Issue Bonds for a Hospital—It has been decided that the village of Taylor's Falls will issue bonds to the amount of $10 000 to establish and maintain a hospital

Typhoid Prevalence in St Paul—The incidence of typhoid in St Paul is now believed to have reached its apex, as no new cases or deaths have been reported during the last week None of the data on the thirty-two cases which have been reported has given any clue to the source of infection It is believed, however to be a typhoid carrier

Work of Venereal Disease Division—The division of venereal diseases of the Minnesota State Board of Health, coordinated with the U S Public Health Service made a total of 3 043 Wassermann examinations between April 1 and June 30 of which 398 proved positive 2 368 negative and 277 doubtful In addition to this seventy-six unsatisfactory tests were made making a grand total of 3 119, with a positive percentage of 12 6 per cent During the same period 606 smears were examined for gonococci with a positive percentage of 39 9 per cent

Dr Mayo Honored in London—A dinner was given July 26 by the president vice president and governors of the American Hospital in London to Dr Charles H Mayo Rochester The Earl of Reading presided Sir William Arbuthnot Lane spoke of the great advantages which would accrue to medical science through the opening of the hospital, Rt Hon Arthur J Balfour expressed the hope that the hospital would prove beneficial to American medical students visiting England and Dr Mayo and Ambassador Davis paid tribute to Major-Gen William C Gorgas——Dr Mayo has returned from his trip to Europe where he attended the meeting of the British Medical Association at Cambridge and of the International Surgical Society in Paris He reports "a most surprising recovery from war conditions' and states that there is apparently "no setback nor depression—in fact, but little to show that they had a war"

NEW JERSEY

Child Hygiene Bureau Stations Opened—The Bureau of Child Hygiene of the New Jersey State Department of Health has opened two stations one at Lambertville and one at Frenchtown the latter to be the center of work which will include Milford and Stockholm A social worker has been appointed to work under the direction of Camden Board of Health Her salary will be paid by the Child Hygiene Bureau which will also suggest her policies The Child Hygiene Bureau has taken the initiative in securing cheaper or free ice for families who could not afford to have it otherwise

Physiatric Institute Opened—An institution known as the Physiatric Institute devoted to diabetes nephritis vascular hypertension and other metabolic disorders has been established at Morristown The site is the former estate of Otto H Kahn, comprising some 200 acres Dr Frederick M Allen is the director The backers are a group of prominent New York and Philadelphia men and financial support is sought chiefly from the individuals and families afflicted with these diseases The organization is in three divisions One is a sanatorium for the treatment of paying patients the income from which helps to support the other two divisions The second is a charitable branch which offers treatment to poor patients at reduced rates or free as far as the available funds can provide The third is a research division aiming to advance the knowledge and treatment of the conditions by all the facilities for clinical and laboratory study which a specialized institution of this kind can offer

NEW YORK

New Reportable Diseases—Botulism and lethargic encephalitis have been added to the list of reportable communicable diseases by recent action of the Public Health Council

Rockefeller Provides Hospital for Women's Reformatory—John D Rockefeller Jr has agreed to turn over at a nominal rental of $1 a year his social laboratory and bureau as a psychopathic hospital for the State Reformatory for Women Bedford He will first make repairs costing $1 000 These buildings will be occupied at once Dr Menas S Gregory announces that several psychiatrists will be added to the staff to classify the prisoners and determine their degree of mental responsibility

The entire faculdade de medicina and other local members of the profession were at the depot to meet them

Personal.—Drs O de Oliveira and Carvalho Azevedo of the faculdade de medicina of Rio de Janeiro recently left for Europe——Dr A Lindenberg and Dr O de Sousa have returned from Europe The latter was on a special commission from the Rio faculdade de medicina and will resume his course on physiology

New Clinic in Uruguay—There have just been installed in the Hospital Militar Central Montevideo a gynecologic clinic and a polyclinic for the treatment of children's disease Dr Eduardo Blanco Acevedo director of the surgical service will be in charge of the clinic and Dr Nieto Zervino in charge of the polyclinic

Public Health Board at Guatemala—The president of Guatemala has appointed the following members of the Superior Board of Public Health Dr Alberto Padilla Dr Mario J Wunderlich Dr Antonio G Valdeavellano Licdo Hector Aparicio Licdo Juan F Melgar Dr Guillermo Cruz and Ingeniero Felix Castillo There has also been organized a public health police under the orders of the board

FOREIGN

Appropriations for Research on Tuberculosis—The Robert Koch endowment a Berlin has granted Professor Lüdke of Berlin 15 000 marks and Professor Selter of Königsberg 6 000 marks to aid in continuing their research on tuberculosis

Institute for Research on Proteins—A sum of 500 000 marks has been donated to the University of Halle

found an institute for research on albumins It is to be in charge of Professor Kossel and to be affiliated with the Institute for Hygiene

Prize for Work on Orthopedics—Owing to a recent legacy from Dr P Redard of Paris, the Academie de medecine offers a prize of 5,000 francs every fifth year for the best work on orthopedic surgery Competition is open to physicians of all countries and to interns of the Paris hospitals

Faure's Hymn to Peace—The Paris *Figaro* offered a prize for a hymn to peace, and had the best six, among the seventy submitted, set to music The one selected by Saint-Saens for his musical setting proves to be the work of Prof J L Faure, the successor of Pozzi in the chair of gynecology in the Paris Faculte de medecine

Cambridge Gives Americans Degrees—Prof John Jacob Abel professor of pharmacology in Johns Hopkins Medical School, Baltimore, and Dr Harvey Cushing, professor of surgery in Harvard University Medical School, Boston, had conferred on them the honorary degree of Doctor of Laws by Cambridge University, July 29

Outings for German Children in Denmark—The *Deutsche medizinische Wochenschrift* states that 8,000 German children have been given hospitality in Denmark since last October, one institution took 500 About half the total were children of the laboring classes Each child was given a short outing, new clothes and foodstuffs to bring home to an average weight of 15 kg

Memorial to Van Engelen—A tablet on the wall of the Saint-Pierre Hospital at Brussels was recently unveiled with much ceremony in honor of the eminent surgeon, Van Engelen, who died in 1918 The funds collected for the purpose proved sufficient to found in addition an annual prize for an intern in the surgical service, to be awarded in the form of books and instruments

International Anthropology Institute—In the second week of September there is to be a gathering at the Ecole d'anthropologie at Paris of a number of persons interested in making this the international center for the anthropologic sciences, including ethnology eugenics, medical geography, comparative anatomy etc Those interested in the matter are asked to send in their names to the secretariat, Ecole d'anthropologie rue de l'Ecole-de-medecine, 15, Paris

Vital Statistics in Spain—The *Siglo medico* states that 306 394 boys were born in Spain during 1919, and 278,958 girl babies, to a population of 20 355,986 Over 482 000 deaths were recorded including 163 198 children under 5 Typhoid was responsible for 5 677 deaths, typhus for 228, tuberculosis for 29 700, cancer for 12 525 and heart disease for 37 883, acute bronchitis for 22 166 and chronic bronchitis for 11,705, suicide for 847, and other forms of violence for 6,909

Medical Work in Palestine—Medical work in Palestine has advanced rapidly during the past two years stimulated by the physicians and nurses of the American Zionist Medical Unit Clinics are being held and lectures given at regular intervals The hospitals and clinics established by the unit in Palestine will be eventually taken over by the Medical College of the Hebrew University, Jerusalem, plans for which are being designed by Prof Patrick Geddes of the University of Edinburgh

Monument in Memory of Brissaud—It is proposed to erect a memorial at Tournai in Belgium to honor the memory of Brissaud who was the first to locate and describe cataract correctly, he thus paved the way for Daviel's extraction Many leading ophthalmologists of Belgium and France are on the committee in charge of the matter, and appeals are being made for subscriptions which can be sent to the secretary, Professor Terrien 41 rue Pierre-Charron, Paris, or to any member of the committee

Memorial to Lannelongue—A monument to Lannelongue was dedicated in July in his natal town Verduzan representatives from the government and scientific societies having charge of the ceremony One report of the ceremonies adds that his name is perpetuated otherwise by prizes in various scientific organizations museums he founded and the numerous works he published on the pathology of the bones, etc, and by the influence he exerted in parliament and as president of different organizations until his death in 1911

Malaria in Italian Soldiers—Representatives of the government departments of the Red Cross, and others recently conferred and adopted a plan for systematic treatment of the demobilized soldiers in Italy who are still suffering from malaria A census throughout the country of all such cases is to be taken and provisions made for treatment at home or in four sanatoriums to be organized in various mountain regions While the man is staying at the sanatorium, his family is to be paid a certain daily allowance Vigorous propaganda is now under way to convince the men of the necessity for taking treatment

The Weekly Cinematophotograph—A new Paris medical weekly has made its appearance, the *Vie medicale,* which seeks to photograph or, as it says, to cinematophotograph in words, in journalistic style, the happenings of the week in medical circles, like a daily paper The first issue has thirty-two pages, and contains among other things two comprehensive articles on lethargic encephalitis and comparative human and veterinary medicine The report of the meetings of the Academie de medecine is written in breezy style by a girl medical student The *Vie medicale* is issued 48 rue Geoffroy, St Hilaire 49 Paris, for 25 francs a year Drs Aloncle and L Nass are the director and editor, respectively

Deaths in Other Countries

Dr **A Antonelli**, a prominent Italian ophthalmologist long resident at Paris——Dr **C F I von Wahlberg**, a leader in the organization of the profession in Finland, aged 72 Since retirement from practice he has published several novels and dramas——Dr **O Schultze**, professor of anatomy and embryology at the University of Wurzburg, aged 61——Dr **O S Dastugue**, subdirector of the Institute of Physiotherapy at Buenos Aires and assistant professor of radiology in the medical school, aged 30——Dr **J E Garcia** of Buenos Aires——Dr **E Lombard**, an otologist of Paris——**Ethel Amy Mordaunt**, Bromley, Kent, England, L R C P, L R C S, Edinburgh, 1908, L F P S, Glasgow 1908, was struck and killed by a motor scooter in Bromley, recently——Dr **Armand Gautier**, formerly professor of chemistry and physiology at the University of Paris president of the Academie de medecine and of the Academie des sciences, and author of numerous works on chemistry and especially on the therapeutic use of arsenic, aged 83——Dr **J S Dauriac**, a well known surgeon of Paris whose latest work, "Chirurgie reparatrice des os," had just gone to the printer at the time of his death——Dr **C S Rodriguez** of Buenos Aires——Dr **J da Costa Lima e Castro**, professor of surgery in the University of Rio de Janeiro aged 62——Drs **Bemfica de Menezes** and **A Pinheiro**, both of Rio de Janeiro

Government Services

Conference on Venereal Diseases

An All American Conference on Venereal Diseases will be held in Washington, D C, Dec 6-15, 1920, under the auspices of the U S Public Health Service Dr William H Welch has been nominated secretary of the conference

Enlargement of War Risk Hospital

Alterations and additions at the United States hospital at Perryville Md will enable the Public Health Service to care for approximately 250 additional patients under the war risk act The hospital has accommodations for more than 1,000 patients and will be limited to cases of psychoneurosis

Course for Health Officers

The U S Public Health Service, in cooperation with Georgia state authorities has established a course of instruction in health work at the University of Georgia Medical School, Augusta The course is designed to give special training to county health officials of the state and an instructor from the Public Health Service will occupy the chair throughout the term

Shortage of Chemicals for Water Purification

At the urgent request of the Public Health Service the commission on car service of the American Railroad Association has relieved the shortage of the aluminum phosphate, bauxite, chlorin, calcium hypochlorite, soda ash, copperas, lime and other chemicals used for the purification of water at municipal water plants The health of millions of people was threatened by a scarcity of these materials at filtraton plants due to the failure of the railroads to furnish sufficient cars to the manufacturers

Plague Prevention Measures

Surg-Gen Hugh S Cumming of the U S Public Health Service, after his return from a plague conference at Galveston, Texas, declared that there has been no spread of plague to other gulf ports and that on investigation two suspicious cases in Mississippi and Texas had been proved not to be plague At the request of local health authorities, rat surveys will be conducted by the Public Health Service in Charleston, S C, and in Florida and Texas seaports Plans for radical changes in the construction of business buildings, dwellings and wharves are being drawn up as part of a nation-wide campaign for rat extermination, following recommendations of the health officers in attendance on the conference to study bubonic plague and rat extermination The specifications will be furnished to the different states and cities in order that they may be incorporated in the building codes throughout the country

Hospital Service of the Bureau of War Risk Insurance

In the Sundry Civil Bill, which carried appropriations of $46 000 000 for medical and hospital services for beneficiaries of the Bureau of War Risk Insurance authority was granted to make the necessary expenditures for converting soldiers homes into hospitals for war risk insurance patients At a conference between Gen Leonard Wood, president of the board of managers of the National Homes for Disabled Volunteer Soldiers Dr T W Salmon representing the Mental Hygiene Committee, Dr H A Pattison representing the National Tuberculosis Association and R G Cholmeley-Jones director of the Bureau of War Risk Insurance, it was decided to convert two of the soldiers' homes for the exclusive treatment of tuberculosis, and one for the exclusive treatment of mental diseases each of these hospitals will accommodate 1 000 patients There are now 17 625 war risk insurance patients in hospitals, 7 980 of these are in Public Health Service hospitals and 9 645 in about 900 hospitals and institutions not under control of the government It is estimated that by June 30 1921 approximately 30 000 war risk patients will be under treatment in hospitals Existing facilities of the War Department will provide for 4 000, the soldiers homes will accommodate 6 000 and the Navy Department hospitals can make provision for 4 000 Approximately 15 000 beds are already under control of the Public Health Service and there will therefore be accommodations for 29 000 patients in hospitals owned and operated by the government

PARIS

(From Our Regular Correspondent)

July 20 1920

International Congress of Surgery

The International Surgical Society at its last general assembly just ended decided to hold its next international congress at London, July, 1923 under presidency of Professor Macewen, Glasgow It was voted to continue to exclude the surgeons of the central empires The International Surgical Society was founded in 1902 through the initiative of the Societe belge de chirurgie and includes about 700 members It has held five congresses the first three of which met in Brussels under presidency of Lucas-Championniere in 1905 Kocher in 1908 and Czerny in 1911 The fourth congress was held in New York under presidency of Professor Depage and the last was just held in Paris under presidency of Dr W W Keen

The Paris Surgical Society

The Societe des chirurgiens de Paris which hitherto has admitted to membership only the professional surgeons, voted to admit associated members chosen from among physicians who are practicing related specialties or are working in fields which have contributed to the evolution of surgery The resolution is inspired by a desire for collaboration with the pathologists bacteriologists chemists physiologists, physiotherapists radiologists and radiumtherapists in particular, and in general with all physicians whose work might be of benefit to the science of surgery

Death of Gautier

Dr Armand Gautier onetime professor of chemistry at the Paris medical faculty died recently at Cannes Armand Gautier was born Sept 23 1837 at Narbonne received a scientific and medical education at Montpellier, and graduated M D, at Paris in 1862 He was a student of Wurtz under whom he became professor agrege in 1869 and succeeded his teacher in the chair of chemistry fifteen years later In 1879 he was elected a member of the Academie de medecine and of the Academie des sciences ten years later

Gautier was one of the greatest of modern chemists His researches on ptomains discovered by him in 1873, and on alkaloids of bacterial origin and his discovery of alkaloids from animal tissues or leukomains won him a reputation in scientific medicine On the other hand his experiments with organic compounds of arsenic led to the practice of subcutaneous injections of sodium cacodylate

Gautier's most important works are his *Cours de chimie minerale et organique* (1895) *Les toxines microbiennes et animales* (1896) *Leçons de chimie biologique normale et pathologique* (1897), and *L'alimentation et les regimes chez l'homme sain et chez les malades* (1904)

Appreciation of the American Activities Against Tuberculosis

Several months ago I mentioned in these pages (THE JOURNAL May 8 1920 p 1339) the recognition given by the Academie de medecine de Paris on the motion of Professor Letulle to the activities of the American Red Cross campaign against tuberculosis in France during the war In turn the Academie royale de medecine de Belgique devoted its attention to this subject [illegible] before the Academy the report of the [illegible] on the Prevention of Tuberculosis [illegible] attention to the impo[illegible] [illegible] invitation of [illegible]

enlose, the Rockefeller Commission has been making in Belgium At Tournai, Namur and Huy, these took the form of a seven day propaganda against tuberculosis Dr Linsly R Williams, director of the commission, Major Stuart, director of propaganda, and Miss F Elizabeth Crowell, superintendent of visiting nurses, came to Brussels not only for the purpose of conducting a popular campaign but also to demonstrate to a selected public the organization, working methods and practical achievements of the commission M Sand found the commission's methods admirably adapted to the popular mentality They include meetings, the "guignol," moving pictures, postcards, posters and pamphlets They reach the children, mothers, workers, soldiers, the general public, civil, military, school and ecclesiastic authorities Everywhere the commission leaves behind a tuberculosis dispensary as a permanent trace of its tour

The nucleus of the organization is American and it is financed by the Rockefeller Foundation of New York, the consultants, however, are French, and the commission as soon as its work is finished, commits it to the hands of local committees Its activities started about three years ago, and in that time it has covered thirty-three departments of France

Dr Bordet, director of the Pasteur Institute of Brussels, who has also assisted at the demonstrations of the Rockefeller Commission, thinks that Americans have found the necessary means of making the masses comprehend He likewise proposed that the Academy put itself on record in favor of a similar organization in Belgium

Panel Physicians' Records

The ministry of health has been considering the form in which panel physicians records should be kept, and has consulted Sir James Mackenzie on the point He has submitted a characteristic memorandum in which he declares that legislation founded on such statistics as are available today would fail for the reason that, apart from slight affections, such as toothache, from 90 to 95 per cent of the complaints which the panel physician sees are undiagnosable even by the most experienced, and most of the small percentage that are diagnosed according to present methods would fail to convey an accurate notion of the real nature of the illness He outlines what he conceives to be the defects in medical knowledge at the present day

Our present classification of disease in the living is based 'upon the morbid anatomy of the dead," and the idea has sprung up in consequence that ailments can be classified according to gross structural changes such as can be seen postmortem Vast numbers of patients, however have ailments that cannot be so classified—there is as yet no structural change Their signs of disease are distressful sensations Then comes the error the physician is likely "to take the most prominent symptom or sensation and consider it to be the disease ' for example, neuralgia, dyspepsia anemia, palpitation, neurasthenia" The truth is that there are always in these cases other symptoms and when these symptoms are gathered together they are found to show a disturbance of so many different organs that the conclusion is forced that there is a common cause which upsets the balance of the different organs In consequence, the physician should not be forced to 'give a name to each disease but should keep records that will enable these symptoms to be related one to another and the real underlying diseases to be found For this purpose index cards are suggested We spend vast sums on drugs and yet 'there is no accurate knowledge as to the effect of a great many remedies" Moreover, if symptoms of disease, and not diseases themselves, are treated, further waste must occur Special investigators should study in actual practice the drugs most in vogue, and make known their findings regarding action and uses Thus a new era in medical treatment would open To remedy these defects, the physician must be taught how to carry on research into the early symptoms of disease If there was a scheme by which he could learn how to question a patient intelligently, how to make short but accurate notes, how to watch the patient as he passes from one phase of disease to another, the working of the insurance act would be greatly facilitated year by year, while a great impetus would be given to the investigation of these dark fields of medicine which only the general practitioner can explore

A committee appointed by the minister of health to report on note taking by panel physicians, and presided over by Sir Humphry Rolleston, has also issued its findings These are to a great extent in sympathy with Sir James' views An envelop, it is advised, should be issued to each physician in respect of each insured person on his list This should bear, when it reaches the physician, the patient's name, address, society, number, the physician's name, the committee's cipher, and the date There should be different colors in use for female and male Thus, on visiting the patient the physician will merely require to make a few notes on the envelop, e g, date of visit, age, etc The "notes" should be written first on the backs of the envelops and then on cards to go inside the envelop These should be such as "are likely to be of value to the physician himself, or to any other physician treating the same patient in subsequent illnesses" The physician will thus be able to describe fully the symptoms he sees, and the cards will form in time a full record of each patient's health without being at all irksome to the busiest physician

The Lister Memorial Fund

The general committee of the Lister memorial fund has received the report of the executive committee appointed in 1912 The subscriptions from the British Empire and foreign countries amounted to $59,230 A memorial tablet by Sir Thomas Brock was unveiled in Westminster Abbey, Nov 1, 1915 and steps are being taken for the erection of a monument in a public place in London In order to carry out the scheme adopted in 1912 for the establishment of the international Lister memorial fund, the following proposals were adopted 1 That $2,500 out of the general fund, with a bronze medal be awarded every three years, irrespective of nationality, in recognition of distinguished contributions to surgical science, the recipient being required to give an address in London under the auspices of the Royal College of Surgeons 2 That the award be made by a committee constituted of two members nominated by the Royal Society, two by the Royal College of Surgeons of England, one by the Royal College of Surgeons in Ireland, one by the University of Edinburgh, and one by the University of Glasgow 3 That any surplus income of the general fund, after providing for the erection of a monument, and after defraying administrative expenses, be either devoted to the furtherance of surgical science by means of grants or be invested to increase the capital of the fund The continued carrying out of this scheme in future years will require the provision of some permanent and adequate machinery, as the Lister memorial committee cannot in view of its constitution, be itself permanent The committee, having ascertained that the Royal College of Surgeons of England would be prepared to become the trustees and administrators of the fund and to carry out its objects, authorized the executive committee to take the necessary steps to give effect to this arrangement.

War Memento from British to American Surgeons

As a memento of the work done in cooperation by American and British surgeons during the war a number of the latter have had made a silver-gilt mace, which is to be presented to the American College of Surgeons The gift is the suggestion of Sir Berkeley Moynihan, with whom Sir Anthony Bowlby (president of the Royal College of Surgeons) and Sir D'Arcy Power collaborated The mace is the work of a well known worker in metal, Mr Omar Ramsden A surgeon's mortar dug up in a Salonika trench was the model for the head, which is surrounded by maple leaves and American eagles The badges of the British and American Army Medical Corps and the serpents of Esculapius are prominent, the name of Philip Syng, the father of American surgery (who was at St George's Hospital before he went across the Atlantic), is introduced, and the roll of subscribers will be engraved in due course An inscription on the mace reads From the consulting surgeons of the British Armies to the American College of Surgeons in memory of mutual work and good fellowship in the Great War"

Child Welfare

Under a law passed Sept. 5, 1919 all agencies and interests devoted to child hygiene which were formerly the exclusive object of private charity are incorported in the newly established Oeuvre nationale de l'enfance These charities have been extending over Belgium for some years and the war gave even greater impetus to the movement At the time of the armistice there were infant clinics in about 800 towns and there were numerous maternity canteens, school lunches were being distributed to more than 1,000 000 children, and there were eighty-five colonies in which from 5,000 to 6 000 debilitated children were received in each month

Minister Jaspar who recently presided at the opening session of the Conseil superieur des oeuvres de l'enfance, recalled the favorable results already attained by past activities and outlined the great projects which still await execution The Oeuvre nationale, such as it is, was conceived by the legislature for the sole purpose at present, of protecting the younger children by the establishment of infant clinics maternity canteens, colonies for debilitated children school lunches and milk stations (gouttes de lait) But this does not mean that its sphere will be limited to these activities It will have to pass on the establishment of all additional related activities, it will determine especially as brought to light by the report on the last budget of the Ministry of Economic Affairs whether besides the maternity canteens there is urgent need of other organizations for the protection of mothers and infants

The infant clinics are the cornerstone of the whole structure, and more than 800 have been established to date It is necessary that all infants of the country and especially those whose parents do not have the means to pay for medical services, should be brought to these clinics in the first months of life

The maternity canteens will perhaps be attached to coal mines and to other industries employing women in short they will be installed wherever proximity to the work of husband or wife gives reason to anticipate that they will be serviceable

During the war, school lunches were introduced in all the communes of the country in other words in all the schools Thanks to the patriotism of our fellow citizens we did not see a recrudescence of the old school quarrel during that time Under the Conseil superieur it should no be revived in the days of peace and to obviate this absolute separation of the teaching function from the question of feeding is necessary

The colonies for debilitated children have already obtained brilliant results Not only that 10 000 children of the cities and industrial centers, thanks to these colonies and to the generosity of property owners who loaned more than eighty chateaux and houses for the work were able to spend several months in the open air and to recuperate from their aggravated undernourishment The average gain of each of these children was from 2 to 3 kilograms The work of the colonies also contributed greatly to prevent the terrible increase in tuberculosis from affecting the younger generation It is self evident that it will be impossible in times of peace to maintain the colonies on the same extensive basis but it is certainly equally indispensable to give children of all ages from the side streets and alleys an opportunity to go to the country or the seashore Because of this the system inaugurated by which the colonies will remain open all year round seems most favorable

Federated Biologic Societies

A federation of the Reunions biologiques affiliated with the Societe de biologie de Paris was recently formed in the laboratory of Professor Brachet at the Institut anatomique du Parc Leopold The reunions of Brussels, Lille Lyons, Nancy Strasbourg, Bucarest and Copenhagen were represented, and the secretary general of the Societe de biologie also attended Professor Bordet president of the Reunion biologique de Bruselles declined the presidency in deference to Professor Bard of Strasbourg The next meeting is scheduled at Strasbourg in the autumn of 1921

BUENOS AIRES

(From Our Regular Correspondent)

June 30 1920

Lethargic Encephalitis

In a short time there have been observed quite a number of isolated cases of lethargic encephalitis In some of the Buenos Aires clinics three and four cases have been treated There have been cases in different towns as far as Salta which is in the northernmost part of the country The Argentine Medical Association at its last meeting discussed four cases of the disease presented by Drs J Destefano, A Viton S Dessy F Grappiolo T Martini and J Bertermi A few days afterward several cases were also reported before the Society of Pediatrics

Argentine Medical Association

This association which includes the majority of the medical societies of Buenos Aires has decided to increase the number of affiliated societies So far during this year the societies of biology medicine and surgery have operated successfully

Pneumoperitoneum

In the medical section of the Argentine Medical Association there have been presented several papers on the application of pneumoperitoneum to the roentgen-ray diagnosis of abdominal diseases This method has become popular in several hospitals

Centenary of the Academy of Medicine

The Academy of Medicine of Buenos Aires has decided to celebrate its first centenary in 1922 with a congress of medicine and allied sciences Three prize will be granted for the best papers presented the first of 5000 pesos and a gold medal the second 3000 pesos and a silver medal and the third 1 000 pesos and a diploma (A peso is now worth about 40 cents) The academy has appointed [illegible] increasing its activities for so far

fourteen members, has shown little life Some scientific lectures are planned for the near future, and one has already been given The academy has asked the government to furnish it with a building of its own

Institute of Surgery

There is now pending in congress an appropriation to furnish with the necessary facilities the chair of clinical surgery The school of medicine has under consideration the creation of an institute of surgery

Meeting of the Argentine Medical Association

The Argentine Medical Association has decided to hold a congress on internal medicine next October The subject to be discussed will be "Cranial Hypertension"

Titration

Dr A Sordelli announces that antidysenteric toxins and serums may be titrated quite accurately with birds as controls

Germany's Food Problem

A memorandum of the national ministry of food and agriculture gives a survey of the food problem of Germany Because of the extraordinary difficulties during the war and the shortage of labor and fertilizer, the acreage of the most important foodstuffs, such as bread cereals, potatoes and sugar beets, has been greatly reduced and the average yield has simultaneously declined From 1913 to 1919, the harvest yield per hectare (2 47 acres) of bread cereals decreased 21 per cent, of feeding grains, 25 per cent, of potatoes, 31 per cent, and sugar beets 30 per cent With the reduced boundaries, Germany's production of bread grains dropped from 13,300,000 tons in 1913 to 8,500 000 tons in 1919, potatoes from 40,300,000 to 21,400,000 tons, and sugar beets from 12,900,000 to 5 800 000 tons An especially serious complication is the fact that by the loss of productive agricultural sections, especially in the east, Germany is deprived of a considerable food surplus The number of cattle fell off from 18,000 000 in 1913 to 16 500 000 in 1919, milch cows from 9,100,000 to 7 600,000, hogs from 18,500,000 to 11,500 000, all told, not less than 41 per cent The average yearly milk yield fell from 2,700 to 1,200 liters, and the total milk production declined from twenty-four to nine billions of liters, while the slaughtering weight of cattle, sheep and hogs dropped as much as 50 per cent Germany is therefore compelled to continue the rationing of some of the most necessary foods and these rations have been reduced to such an extent that they represent only about one half of the minimum calory requirement of an adult man Since the country is not yet in position to import the required foods to make up the deficit, the population as a whole is still in a state of undernutrition, a condition which has entailed terrible sacrifices On the one hand, the growing generation is being sapped of its strength while on the other hand, the adult populace is unable to regain its full working strength As a result it is impossible to speed production in the mines and industries The miners especially have complained repeatedly regarding the insufficient diet, laying particular emphasis on the fact that the bread is made of as high as 80 per cent filler The present industrial conditions make it impossible for a growing element of the populace to pay for even the small allowance of food at the reduced prices established by the government The weekly ration at the present, for instance, consists of legumes, sugar, marmalade and artificial honey with a calory value of 12,600, but it costs 101 marks as compared to 7 77 marks six years ago The import requirements of Germany in the next fiscal year will total 2,000,000 tons of bread grains, the same quantity of feeding grains, 750,000 tons of oil seeds, 180,000 tons of meat and bacon, 144,000 tons of fats, 500,000 tons of fish, 500,000 tons of phosphate rock and 350,000 tons of pyrites, with a money value, all told, of 3,403,600,000 gold marks

The Conflict Between Physicians and Krankenkassen

At a meeting between representatives of the physicians and the krankenkassen, June 4, an agreement was virtually reached, according to which medical arrangements are to be left to free agreements between the krankenkassen and individual physicians or medical societies Where the free choice of physicians is already in practice, this system must be maintained, provided it does not endanger the existence of the kasse Under this scheme an insured patient can consult virtually any qualified physician In rural communities a patient may call the nearest physician, and may call an additional qualified physician in consultation, provided he assumes the extra cost Payments for services rendered are to be made by the kasse direct to the attending physician's fee for office visits being 4 marks, and for home visits, 6 marks For other services, the minimum stipulation of the projected revision of the official Prussian fee scale shall apply Until this is published, a 15 per cent increase shall be added over the prevailing scale, except in obstetric cases, in which the increase shall be 400 per cent Lump sum payments shall be subject to local agreement, and in occupied territory an additional increase is granted The new fees are effective as of April 1, 1920 Travel allowances, which would include compensation for the loss of time as well as actual traveling expenses, shall be 6 marks for every two kilometers by day and 10 marks by night If the physician is furnished the means of travel, he shall be compensated for the loss of time at the rate of 2 marks for 2 kilometers by day and 4 marks by night To supplement and improve the medical treatment and to advance the interests of public welfare the kassen are authorized to establish diagnostic, consulting and dispensary clinics and physiotherapeutic and mediomechanic institutes These shall be placed at the free disposal of the insured members and their dependents In the future, disputes between the kassen and physicians shall be settled by courts of arbitration subject to appeal to superior courts, the definite establishment of which will follow after supplementary agreement

Depending on local agreements, certain exceptions are incorporated in the general arrangement In Berlin, for instance, the system of free choice of the attending physician will be introduced throughout Beginning with April 1, 1920, the quarterly capitation fee is fixed at 7 50 marks, with an additional 2 5 marks in the first quarter While the fee scale applies only for 1920, the other provisions will be valid for five years Subsequent conferences shall determine the procedure regarding any matters still in dispute General free choice of physicians shall go in effect as soon as the necessary administrative arrangements have been made The parties to the agreement are in accord on one point, that if any kasse does not introduce the new system, its physicians shall be excluded from obtaining any benefits from other kassen operating under the new system In Wurttemberg and some other states special agreements have been made between physicians and kassen, some of these are more favorable than that which has been arranged for the whole country Although the physicians did not obtain all their demands, there is considerable cause for satisfaction over the terms One particularly happy feature is the apparent willingness of the krankenkassen to settle the questions relating to the medical care of its members in an amicable manner rather than to seek a quarrel at every opportunity

Marriages

BERTRAM GROESBECK, JR, Lieut M C, U S Navy, to Miss Maria Commelas Canals, at San Francisco de Macoris, Dominican Republic, June 19

LOUIS G MARTIN, Capt, M C, U S Army, Camp Gordon, Ga, to Miss Caroline Douglas Oden, in New York City, August 2

ABRAHAM MATTES to Miss Henrietta D Pearlstine, both of Charleston, S C, in New York City, July 27

ERNEST E PARKER, Oxford, Ind to Miss Mary Francis Kennedy of Templeton, Ind, at Oxford, July 26

EARL D JONES, Roberts, Idaho, to Miss Bessie May Badley of Wichita, Kan, August 6

ALBERT J WITTSON to Mrs Mabelle Lindley Burras, both of New York City, August 6

L FORREST SWANK to Miss Mary Coryell, both of Indianapolis, July 31

Deaths

Louis Joseph Dandurant, St Joseph, Mo, Central Medical College of St Joseph, Mo, 1898, aged 45, a specialist in surgery, president of the Buchanan County Medical Society, captain, M C, U S Army, and discharged Dec 5, 1918, professor of materia medica and pharmacology in Ensworth-Central Medical College, St Joseph, a member of the local board of health, was drowned in the Missouri River, near Bean Lake, August 1, when his automobile plunged through a washout into the river

Daniel Clark Jones, St Louis, Rush Medical College, 1863, Medical College of Ohio, Cincinnati, 1866, aged 82 once mayor of Topeka, Kan, surgeon-general of Kansas and president of the state board of health, surgeon of the Second Illinois Cavalry during the Civil War and for eighteen years chief surgeon of the National Homes for Disabled Volunteer Soldiers at Leavenworth, Kan, and Danville, Ill, died at the home of his daughter, July 27

Benjamin George Pool, Washington, D C, George Washington University, Washington, D C, 1879, aged 65 a member of the Medical Society of the District of Columbia, and the Association of Military Surgeons of the United States, surgeon of the Fourth Battalion, D C N G, for many years, died at the home of his daughter in Washington May 25, from myocarditis

Olga Davis, Chicago, College of Physicians and Surgeons, Chicago, 1909, aged 45, a specialist in diseases of children and for many years a member of the staff of the Emanuel Mandel Memorial Dispensary of Michael Reese Hospital, died at Mackinac Island, Mich, August 9 from heart disease, a month after an operation for disease of the gallbladder

Matthew Joseph Hoey, P A Surg, U S P H S reserve, San Francisco, College of Physicians and Surgeons San Francisco, 1905, aged 38, for nine years in the service of the Panama Canal Zone, and quarantine officer at Balboa for six years, died in the U S Marine Hospital, San Francisco, August 1, from acute parenchymatous nephritis

Harold Lee Meierhof, New York City, Columbia University College of Physicians and Surgeons, New York City 1917, aged 26, Lieut, M C, U S Army, and discharged Jan 11, 1919, an intern at Mt Sinai Hospital, New York City, died in that institution August 5

Charles Henry Althans, Brooklyn, University of the City of New York, 1881, aged 83, surgeon of the Fifty-Second New York Volunteer Infantry during the Civil War, a practitioner and druggist for more than sixty years, died in Bellevue Hospital, August 4

Norman Perkins Quint, West Medway, Mass Harvard University Medical School 1870, aged 73, a member of the Massachusetts Medical Society, medical examiner (coroner) of the Seventh Norfolk District for twenty years, died in a hospital in Boston, July 27

Arthur Lloyd Jones ⊕ Lima, Ohio, Fort Wayne (Ind) College of Medicine, 1897, aged 48, captain, M R C, U S Army, and discharged July 30 1919, for fourteen years health officer of Lima, died near Jackson Center, Ohio July 25, from angina pectoris

⊕ Indicates Fellow of the American Medical Association

Lynn Ransom Palmer, New York City, Columbia University College of Physicians and Surgeons, New York City, 1903, aged 40, a member of the Medical Society of the State of New York, died at Old Forge, N Y, July 23, from tuberculosis

Laura Ann Cleophas Hughes, Boston, Tufts College Medical School, Boston 1895, aged 60 a member of the Massachusetts Medical Society, a specialist in public health, died in the House of the Good Samaritan, Roxbury, Boston, July 30

Howard Lankester, St Paul (license Minnesota State Board of Medical Examiners 1883), aged 74, commissioner of health of St Paul from 1910 to 1914, died in Columbia Hospital, Milwaukee July 30 from diabetes

Carey M Klyne, Youngstown Ohio, Eclectic Medical Institute Cincinnati, 1894, aged 48, for two terms coroner of Mahoning County, was drowned while bathing at Milton Lake near Youngstown, July 25

Harvey Vickard Murray, Honolulu Hawaii, University of the City of New York, 1891, aged 53, a member and once president of the Medical Society of Hawaii, died in San Francisco, recently

Thomas Jackson Charlton ⊕ Savannah, Ga, Bellevue Hospital Medical College 1885, aged 56, for many years superintendent of the Savannah Hospital, died July 25

James S Bell, Oak Park Ill, Homeopathic Medical College of the State of New York New York City, 1866, aged 79, died, August 8, from senile debility

Arthur Birch Lockridge, Danville, Ill, Indiana Medical College Indianapolis 1906, aged 41, died at the home of his parents in Greencastle, Ind, August 1

Isadore Mayor Joseph Kane, Chicago, Loyola University, Chicago 1920, aged 29, died in Mercy Hospital, Chicago, August 1 from general peritonitis

Maria Brown Averill, San Diego Calif, Hahnemann Medical College of the Pacific San Francisco, 1889, aged 85, also a pharmacist, died July 7

Benjamin M Sherwood, Bicknell, Ind, Missouri Medical College St Louis 1889, aged 64, died in St Vincent's Hospital Indianapolis, July 29

William Francis Farmer, Tewkesbury, Mass, Harvard University, Medical School, 1905, aged 35, died, June 5, from intestinal tuberculosis

Thomas D Aydelotte, Lyons, Ind, University of Louisville Ky 1888, aged 82, a practitioner for fifty-five years, died about July 30

James J Concannon, New York City, College of Physicians and Surgeons in the City of New York 1890, aged 64, died, August 1

George Phillip Rodemich, Millstadt, Ill, Barnes Medical College St Louis, 1908, aged 47, died June 12, from nephritis

Romulus Culver Biggs, Greenup, Ky, Bellevue Hospital Medical College 1868, aged 76, died, May 22, from arteriosclerosis

Moses Chappell Heath, Richmond, Ky, Bellevue Hospital Medical College 1871, aged 75, died in Stamford, Ky, July 27

William J Young ⊕ Fairfax S C, University of Maryland Baltimore, 1872, aged 69, died, July 25 from heart disease

Julius C Fitch, Hastings Minn, Rush Medical College, 1866 aged 79, a veteran of the Civil War, died, July 23

John Frank Peterman, Lebanon Pa Hahnemann Medical College Philadelphia 1886, died, July 25, from pneumonia

Isaac W Finley, Guthrie Okla, Meharry Medical College Nashville Tenn 1912, aged 32, died in Denver July 22

Ulrich Harder, St Louis Missouri Medical College, St Louis 1878 aged 74 died June 27, from myocarditis

Samuel Clymer Moyer, Lansdale Pa, Hahnemann Medical College Philadelphia 1872, aged 73 died August 4

James J Tillapaugh, Wolcott N Y, Baltimore University 1890 aged 63, died August 5 from heart disease

James H Roberts, Ehrhardt S C Medical College of South Carolina Charleston 1887, died July 18

Richard H Drewry, Brooks Ga Medical College of Georgia Augusta 1877 aged 67, died June 25

James K P Black, Sage Ark. University of Nashville, Tenn, 1877, aged 79, died, July 21

VALUABLE METHOD OF EMPLOYING ARSPHENAMIN IN SYPHILIS *

OLIVER S ORMSBY, M D
CHICAGO

of the great problems of medicine today is the
l of syphilis Its control and restriction are the
onditions we can hope to strive for, as eradica-
not in the realm of human possibilities, owing
peculiar method of transmission The impor-
of the disease was emphasized during the recent
l War, when in spite of the enormous amount of
done to prevent its dissemination it has greatly
sed throughout the world In this country we
t likely to suffer the increase noted in Europe,
en here the disease will occupy a commanding
'or years to come In a recent communication,
le [1] stated that syphilis has vastly increased in
during the war Brocq and others agree that
nas been an increase, but not to the extent
by L redde The campaign of public education
ng venereal diseases, which began before the
nd was greatly augmented during that period,
- with measures being taken since these dis-
have become problems of public health, are
uting to the limitation of syphilis, but the
of its successful treatment is still of great
ance The rapid sterilization of persons likely to
nate the disease immediately shows results
'e many excellent clinics now established all
his country where persons are treated who are
n of the possibilities of the disease, good work
n done through the social service departments
l as otherwise in the modern management of the
-1

more than 400 years, mercury stood practi-
lone as the sheet anchor in the treatment of
ase, and it still holds an important position
list of remedial agents have arisen, been tried
ndoned, always in favor of mercury The one
hat has successfully vied with mercury is ars-
min, and after ten years of employment its
ance is universally recognized The two
that have stood in its way have been the diffi-
attending its administration and its possible
s The former apparently cannot be overcome
a fairly serious matter, as syphilis occurs every-
and not all physicians can equip themselves
properly, nor do they care to undertake to acquire
the technical skill required for its proper administra-
tion While individually each of these sees only a
limited number of patients so infected, yet, in the
aggregate it amounts to a large number In the
larger centers of population this difficulty does not
apply, as a sufficient number of qualified men can be
found to do the work successfully, and within a rea-
sonable time, through education of the younger men
this factor will be overcome The second condition,
that of the dangers attending its employment, has
been so far reduced through improvement in technic
of administration and manufacture of the drug that
the dangers attending its employment have been so
far reduced that it is likely that if statistics were
available the untoward results of arsphenamin would
be found to be no greater than those of mercury

The early hope of a single dose eradicating the
disease was soon shattered but the marked effect
of the drug on the disease compelled its continuance
and intensive work has been done all over the
world to devise the best method for its employment
That this problem is not solved is evident by a survey
of the diverse methods now in use In its earlier days,
arsphenamin was administered only once in two
weeks, with mercury in the interim, later, the interval
was reduced to ten days, and for some time before
the war most clinicians had been giving the injections
in a series of from five to eight or from five to seven
day intervals, combined with mercury This is practi-
cally the standard method used today, and was suc-
cessful in the American army

In 1916, Pollitzer [2] outlined a method he had
employed successfully and apparently without danger,
of using three injections of arsphenamin, each consist-
ing of 0 1 gm for from 25 to 30 pounds body weight,
on successive days, following this with eight weekly
injections of 2½ grains each of mercuric salicylate
Three series in a year were employed, with a rest
period of two months between the series This
method was founded on the scientific theory of
fractional sterilization as employed in the laboratory
The principle is alluring, as it includes a concentrated
attack on the micro-organisms in such a manner that
their development between treatments is not possible
to any degree From clinical experience it is evident
that a single injection of a size compatible with safety
cannot destroy all of the spirochetes present, and
when the interval is prolonged between injections, the
remaining micro-organisms reproduce so that it is
possible that almost, if not quite, as many are present
at the second injection as at the first, so that other
factors would necessarily have to intervene before the

an s address read before the Section on Dermatology and at the Seventy First Annual Session of the American Association New Orleans April 1920

1 de Bull Soc franç de dermat et de syph 1919 p 1

2 Pollitzer Sigmund The Principles of the Treatment of Syphilis J Cutan Dis 34 633 (Sept) 1916

infection is overcome In this method it is supposed that at the first injection the major portion of the micro-organisms are destroyed, and as the second injection follows so soon, many of those remaining are overcome and the few that escape this are reached with the third That this is not literally true is evident, but the fact remains that many patients thus treated early do not show further signs of the disease The possible dangers attending this method were discussed by many, but most observers agree that if it were safe it offered possibilities more promising than other methods

Late in 1916, I began using arsphenamin in selected cases at first, and later in practically all by a similar procedure I found that the clinical and serologic results were practically the same when an interval of one day was allowed between the injections, and the few patients who felt somewhat depressed by the treatment when given daily were able to take it every second day without discomfort

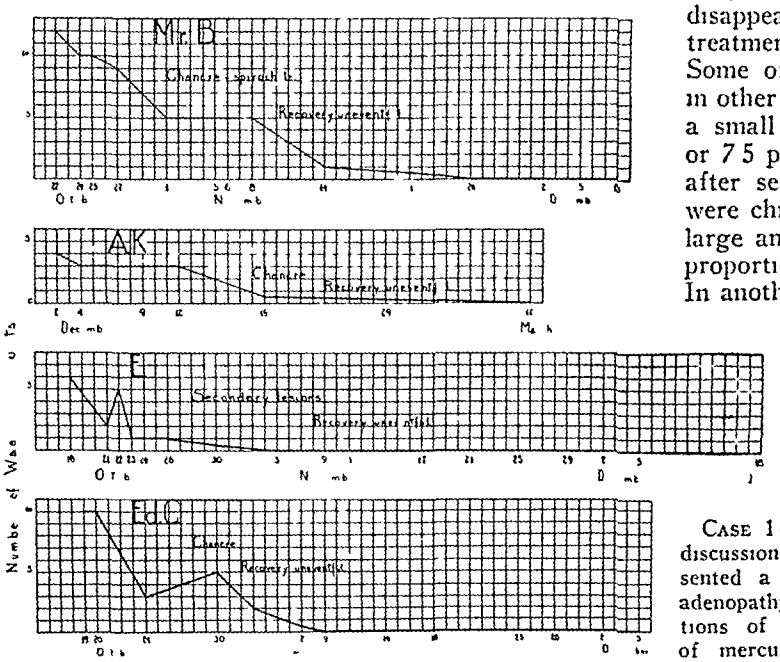

Chart 1—Wassermann curve in four patients treated by the method described in this paper no clinical relapses Routine treatment first day 0 2 gm arsphenamin third day 0 4 gm arsphenamin fifth day 0 4 gm arsphenamin twenty mercury injections, arsphenamin injections repeated

TECHNIC

In the early stage, before generalization has occurred, three injections of arsphenamin are given with an interval of one day between the injections The average dose is 0 4 gm , but in some instances 0 5 or 0 6 gm are given when the patient is large and vigorous In patients not previously treated, the first dose is never more than 0 2 gm Following this, one month's treatment with mercury, either by injection or inunction, is employed Six weeks from the last arsphenamin injection, three more are given It appears important to give the second series in six weeks, as at that time the Wassermann reaction is apt to be negative and is more likely to remain so if treatment is then employed If two or more months elapse before the second series, a Wassermann relapse is probable In well developed cases not previously treated, the same procedure is employed, except that after the second series of arsphenamin twelve injections of mercuric salicylate are given at weekly intervals, or their equivalent in inunctions over a period of three months, when a third series of arsphenamin is given as before, this being followed by another three months of mercury In the second year two series of treatments are given in the Wassermann negative cases as a prophylactic measure In the Wassermann positive cases the procedure is as outlined for the first year

RESULTS

In a series of 160 private cases these results were noted after from two to five courses had been given Sixty, or 37 5 per cent , remained clinically well and Wassermann negative as tested for periods varying from one to three years , thirty-six, or 22 5 per cent were identical with the foregoing except that they were watched only for a period of from six to nine months after finishing the treatment There has been no opportunity for testing these cases further Fifty-*two, or 32 5 per cent , I class as doubtful, as they* disappeared after receiving two or more periods of treatment, and I have not made subsequent tests Some of these have been reported from colleagues in other cities as remaining negative It is likely that a small proportion are serologically free Twelve, or 7 5 per cent , failed to respond serologically even after several periods of treatment The 160 cases were chiefly late and latent, and all had had quite a large amount of treatment previously, only a small proportion were active or so-called secondary cases In another small group seen and treated in the early chancre stage, before the Wassermann test became positive, 100 per cent were apparently entirely relieved Some of these have presented negative findings for over two years Three case records are of sufficient interest to note

REPORT OF CASES

CASE 1—This illustrates the value of the method under discussion The patient was first seen in 1914 and then presented a primary lesion of five weeks' duration, general adenopathy and a positive Wassermann reaction Two injections of arsphenamin followed by twenty-two injections of mercuric salicylate composed his first course Clinically the patient was then and has since remained well. Thirty and sixty days after the termination of this period, the Wassermann reaction was positive Then three injections of arsphenamin and twenty of mercuric salicylate were given The Wassermann reaction was still positive at the expiration of thirty and sixty days following this period, when a third course of treatment was given consisting of four injections of arsphenamin and twenty of mercury After a two months' rest, the Wassermann reaction still being completely positive, the patient was given two injections of arsphenamin on successive days, after which the Wassermann reaction was reduced to mildly positive, where it remained for three months This was late in 1916, and it was decided to employ the method described in this paper, but before the treatment was instituted, the blood findings were confirmed by Dr Stillians At this date the patient had been under treatment for more than two years, was clinically well but serologically positive, and had been given eleven injections of arsphenamin and sixty-three of mercury in addition to some internal treatment Three injections of arsphenamin on alternate days were now employed Three weeks later the Wassermann reaction was still positive but became negative in six weeks when a second series of three injections of arsphenamin were given In three months a third series of three injections were given, even though the test remained negative and six *months later a fourth series One and a half years* after this

series a provocative injection was given, which did not change the negative reaction During the last two years and nine months, eight tests have been made, the last one, April 10, 1920, all of which have been negative

CASE 2.—This illustrates the reversal of the Wassermann reaction after it had been persistently *positive* under *long-continued* treatment, chiefly mercurial The patient was first seen in 1910 and presented a syphilitic glossitis and a positive Wassermann reaction For one and a half years, mercury and potassium iodid were administered, together with local treatment During the next five years, nine injections of arsphenamin and seventy-one injections of mercury were given in courses, in addition, potassium iodid and mercurial inunctions were employed Early in 1917, one period of arsphenamin, consisting of three injections given on alternate days reversed the reaction and it has been negative since the last being made two years and eight months after this treatment

CASE 3.—This illustrates a delayed development of symptoms The patient was seen in October 1916 when he presented a typical primary lesion of twenty one days' duration No spirochetes were demonstrable, as calomel had been used as a local application There was beginning inguinal adenopathy, and the Wassermann reaction was negative Four injections of arsphenamin at ten day intervals together with ten injections of mercury, composed a period of treatment lasting two months The Wassermann reaction was negative at the end of the third fourth and fifth month At the end of the sixth month a generalized maculopapular eruption of syphilis developed, and coincidentally the Wassermann reaction became *positive for the first time* During the following three months five injections of arsphenamin and twenty of mercury were employed after which the Wassermann reaction became negative During the following two and a half years nine injections of arsphenamin and much mercury had been employed and the patient had remained clinically free and Wassermann negative

STUDIES AT RUSH MEDICAL COLLEGE

In a group of 258 cases treated at Rush Medical College by Dr Shafer, in which the method outlined above was adhered to, 110, or 42 per cent, responded to three courses or less, while 148 failed to respond and required more treatment Of the 258, twenty-one were primary, and of these, twenty, or 95 per cent, responded to three courses or less Of the total number, 104 were early secondary, of which fifty or 40 3 per cent, responded, 134 were late and latent, of which forty, or 29 9 per cent, responded Of the 110 recorded as responding to the treatment, forty-two were negative from six to twelve months after treatment, and sixty-two less than six months A sufficient time, therefore, had not elapsed to make definite statements as to the ultimate results Judging from the history of the forty-two cases remaining negative, it seems likely that in a year a majority of the sixty-two will show similar results

In order to determine, if possible, the effect of different sized doses and varying intervals, several groups of cases have been studied at the clinic at Rush Medical College Quantitative Wassermann tests have been made in these cases by Dr Retinger, and the treatment has been administered by Dr Shafer As this study is now in progress, only a few observations are permissible here The technic of the Wassermann work was conducted in such a way in the series of experiments as to determine the smallest quantity of the patient's serum which was able completely and exactly to deviate one unit of complement in the presence of the optimum quantity of a standard antigen, the same antigen being used through the series and proved to retain its optimum within the same limits of dilution during the whole period of time

Ten complete reports are included here In four, the method described in this paper was employed and all the patients made rapid and good recoveries In a series of six patients, two were given 0 1 gm every second day, one was given the same size dose daily, two were given 0 15 gm every second day and one 0 15 gm every third day, all over a period of from two to four months Five of the six developed symptoms of the disorder while under treatment This method, therefore, of giving small but frequent doses was soon abandoned It was interesting to note from the Wassermann standpoint that the curve falls *during the first five days of treatment, and rises again* to reach a high point at the seventh to tenth day when it begins again to fall slowly until a negative test is reached The development of symptoms was not accompanied by any marked change in the appearance of the Wassermann curve

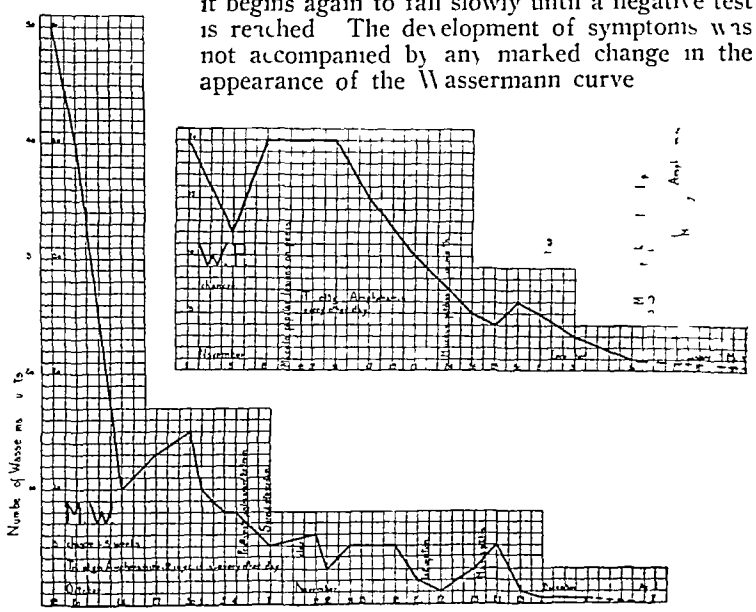

Chart 2.—Wassermann curves of two patients treated with small doses of arsphenamin at short intervals with date and character of clinical relapses

PUBLISHED REPORTS OF OTHER METHODS

It cannot be proved statistically that the method described in this paper gives a greater number of negative cases clinically and serologically than other methods, as statistics are not available It appeared successful to us, as a large proportion of the cases recorded here had *not* responded to other methods and did respond when treated in this manner In a communication on the abortive treatment of syphilis, Altman [3] has given the statistical results of the treatment of 300 chancres in which a portion received two to three injections of arsphenamin in a dosage of 0 4 to 0 5 gm, combined with intramuscular injections of mercury, and later four to six injections of arsphenamin together with eight to twelve injections of mercuric salicylate Of the 300 cases, eighty-one were under observation from one to four years, and of these, 95 per cent were clinically and serologically cured In his review of other workers, the percentage of cures in similar cases varied from eighty-seven to 100

3 Altman Dermat Ztschr 23 257 (May) 1916

In a recent contribution, Gibson[4] recorded the results of treatment in two series of patients In the first series, consisting of eighty-nine, he gave what he termed a concentrated course This consisted of weekly injections of the kharsivan brand of arsphenamin in a dosage of 0 6 gm , except the first dose, which was 0 3 gm , and continued the injections until 2 7 gm had been given The interval between the third and fourth injections was two weeks in place of one The entire course lasted from five to six weeks If the Wassermann reaction remained positive after this course, potassium iodid was given for two weeks, when two more injections of kharsivan were given at weekly intervals With this method, 52 80 per cent became negative with 3 gm , and 15 73 per cent with 4 gm , while 25 84 per cent remained positive after 4 gm and 5 61 per cent were doubtful after 4 gm In 100 cases treated with what he termed "a prolonged course," the results recorded were given as 68 per cent negative after 3 gm , 38 per cent after 4 gm , and only 4 per cent were positive after 4 gm This course consisted of three injections each of 0 3 gm , then two of 0 4 gm , and two of 0 5 gm , at weekly intervals except between the third and fourth injections, when a two week interval was allowed The entire course required eight weeks for its completion The criterion of cure in these series was a negative Wassermann reaction As it was impossible to follow the cases, no figures were given as to recurrence or end-results

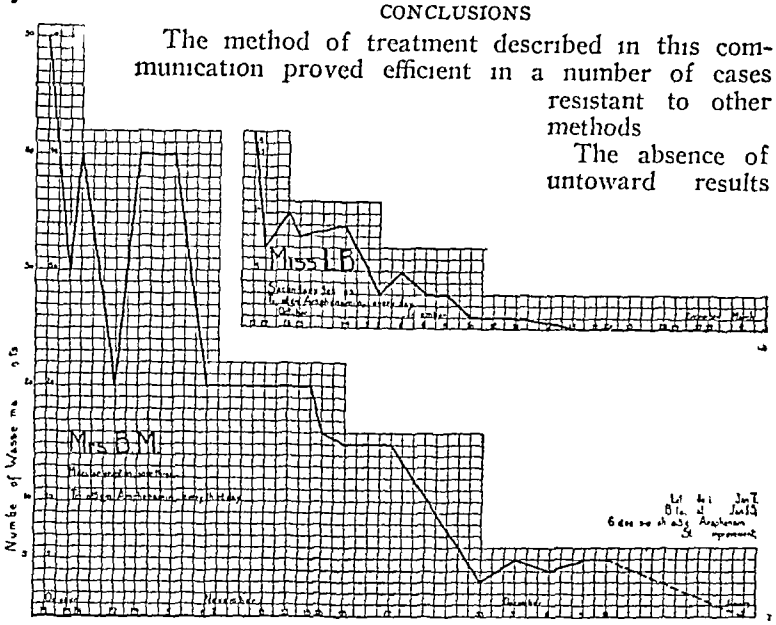

Chart 4 —Wassermann curves of two patients treated with small doses of arsphenamin at short intervals with date and character of clinical relapse in one

IMPORTANCE OF EARLY TREATMENT

From the results obtained in early cases and those obtained in later ones, as recorded in this paper, the fact is emphasized that the time to treat syphilis is in its beginning Unfortunately, the major portion of our cases were first seen in the later stages, when its eradication is most difficult The study of our records strongly impresses the fact that it is essential to disseminate the information that a venereal sore, no matter how insignificant in appearance, should be examined by a competent man and never treated in any manner until its nature is demonstrated by a microscopic examination If all druggests would refrain from prescribing for such lesions, and all physicians not equipped to make the proper examination microscopically would see to it that the patient was directed immediately to a place where such examination could be made, the prevalence of syphilis would be greatly reduced

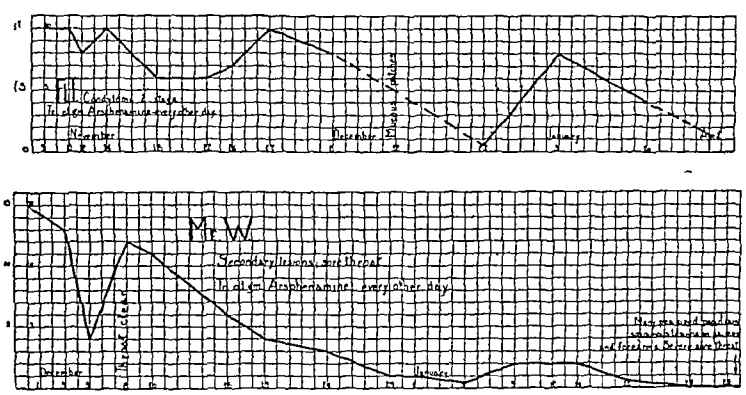

Chart 3 —Wassermann curves of two patients treated with small doses of arsphenamin at short intervals with date and character of clinical relapses

CONCLUSIONS

The method of treatment described in this communication proved efficient in a number of cases resistant to other methods

The absence of untoward results and reactions of any moment in the large number treated makes it appear as safe as other methods

The percentage of cases remaining Wassermann negative and clinically free over a period of from one to three years is not large, as many of the patients, after having two or three negative tests over a period of from six to nine months after the termination of treatment, have not since reported for examination

A comparison with results from other methods cannot be made, owing to lack of extended reports of cases treated by other methods, the major portion only having been watched for less than one year

Several reports are available of cases treated in the chancre stage, and they are similar to ours in end-results

It appears evident from experimental work herein reported that frequently repeated small doses, that is from 0 1 to 0 5 gm , are inefficient The combined use of arsphenamin and hydrargyrum in periods either as herein described, or by the method commonly employed today in which arsphenamin is administered every five to seven days in periods of five to eight injections, appears at present to be the method of choice

The promptness with which many patients become clinically free and Wassermann negative, often with a single course, is encouraging, but should not lead to the conclusion that the disease is eradicated, as Wassermann relapses occur from six months to a year or more after having been continuously negative in the interim It is therefore necessary to continue treatment for from one to two years, even though it may seem superfluous in some cases

4 Gibson H E Brit M J 1 114 (Jan 24) 1920

The length of time that a Wassermann positive should be treated, and the amount of treatment that should be given, cannot be stated When a patient is clinically well and has been for years, and has had a large amount of treatment without permanently affecting the blood reaction, it is difficult to say how far we are justified in pushing treatment In certain of these a spinal fluid examination reveals findings that are significant, in many it does not

Finally, it can safely be stated that with arsphenamin and mercury together we have a method of combating syphilis that is better than any method previously employed, and until more efficient drugs are found these should be used at the earliest possible moment, and continued a sufficient length of time to eradicate the disease, or demonstrate the inability of the drugs to accomplish this result

PENETRATION OF THE INTESTINE BY ENDAMEBA HISTOLYTICA*

KENNETH M LYNCH, M D
CHARLESTON, S C

As a contribution to the pathology of amebic dysentery, I present certain observations that have been made during the examination of several cases in my necropsy service The particular point on which these observations bear is the means by which the ameba gains entrance to the tissues of the wall of the intestine Since this question appears still to be unsettled, it is thought that the apparently clear trail of *Endameba histolytica* into and through the wall of the intestine in these typical chronic cases is worthy of study

Fig 1—Nests of amebas in crypts epithelial destruction beginning penetration

In the first place, there is encountered no evidence that the ameba passes through the surface of the mucosa even though there may be large denuded areas where the epithelial covering has been lost The ameba is not seen within the first part of the mucosa, and except at the edges of ulcers is not seen within the mucosal tissues above the base of the gland crypts, save the occasional straggler

One does see, however, a marked invasion into the glands In this there may be seen individual cells that have penetrated to the bottom of glands in which the epithelium remains intact and in good condition,

Fig 2—Nests of amebas in crypts epithelial destruction penetration and migration

but what is more significant is the common accumulation of amebas, groups of three or four or as many as seven or eight in the bottom of crypts in which the epithelium has been partially or wholly destroyed The common picture is that of several amebas hugging the basement of a crypt surrounded by some granular detritus which appears to be remnants of decomposed epithelium, the lining of the crypt at this place being lost but the epithelium of the neck of the gland partially or wholly intact (Fig 1)

The next development appears to be a migration of amebas from this nest through the basement of the gland, into and through the intervening tissues and muscularis and on into the submucosa One may actually see the cell fixed in the act of penetrating from the crypt and on into the tissues below (Figs 1 and 2)

When this nest of amebas and this port of entry has been established, there occurs a fairly wide migration for a considerable radius in all directions except toward the lumen of the intestine There occurs a thrombosis of blood vessels of submucosa or muscularis (Fig 3) and a necrosis of the tissues above with the development of the ulcer leading to the surface The characteristic wandering of the cells downward and laterally and not into the mucosa is apparently responsible for the extension of the ulceration beneath the mucosa with the production of the undermining so peculiar to this infection

Large numbers of amebas accumulate with an ever widening field of operation in the submucosal tissues beneath these ports of entry, and their accumulation is attended by a low grade inflammatory reaction in which there is an edema, a collection of lymphocy and some fixed tissue proliferation (F gling members of the colony wand

* From the Department of Pathology of the Medical College of the State of South Carolina
* Read before the Section on Pathology and Physiology at the Seventy First Annual Session of the American Medical Association New Orleans Apr l 920

when not in force seem to create little disturbance In numbers they are most active in the submucosa, but may invade the muscular coats and may even pass through the wall and into surrounding parts

This series of events appears to constitute the real pathology of amebic intestinal infection as seen in these cases

Now, while in the main the ulcers do not go beyond the submucosa, the process may extend through the wall, and, in several long standing cases I have encountered, as a sequel to this, a characteristic ramifying abdominal abscess formation which I have not seen described in detail

There was one case (Path 169-14 84) in which the whole large intestine was riddled with ulcers of various stages, and the process had extended for a short distance above the ileocecal valve There were two complete erosions of the colon, one of the transverse colon and one of the first part of the descending colon There were old, dense, fibrous adhesions binding the viscera of these localities together into an almost inseparable mass

From the erosion of the transverse colon a large abscess, containing pus with a distinct hydrogen sulphid odor, ran in a tortuous course behind the peritoneum, through the retro-abdominal tissues to the right and over to the root of the liver, where the foramen of Winslow was closed by adhesions There was a large amebic abscess without any evidence of bacterial infection in the liver just over the retroperitoneal

Fig 3—Ameba migration thrombosis and early ulceration

abscess the two not being continuous but there being adhesions between

From the erosion of the descending colon a similar tortuous abscess ran up to and involved the lower half of the spleen, the course being transperitoneal and walled off by fibrous tissue, and downward behind the peritoneum into the pelvis

Sections from various parts of the tracts of these abscesses show a granulation tissue wall with surface

Fig 4—Extension of ulcer amebic penetration and infiltration of submucosa reaction in submucosa

necrosis and pus formation In this necrotic surface no amebas may be found, but they are encountered at several places in the loose tissues beyond the active inflammation, a characteristic of amebic abscess and ulcer Always they are the vanguard, the destruction taking place behind them

This abscess development must be considered along with the extension of the infection to the peritoneum, liver and lung, as an important complication of intestinal endamebiasis

---

Compulsory Health Insurance —The *Medizinische Klinik* reproduces the communications that have been published in THE JOURNAL on the subject of compulsory state health insurance and in American journals and chamber of commerce reports, etc, the Berlin journal adding editorial comment as follows 'We must admit that these American expressions of opinion portray with sharpness and one-sidedness but not without a certain justification the influence which compulsory state health insurance and the legislation in regard to it, in Germany, has had on the practice of medicine and which they continue to exert along the same lines so that the representatives of a free profession are being forced into the position of paid public servants It is interesting for the German physician to read these antagonistic views of the American profession in the matter It remains to be seen whether America will succeed in finding a way to solve the problem of protecting against sickness and caring for the sick without introducing the dreaded German system' of compulsory health insurance. The contracts with the sickness insurance companies in Germany expire July 1, and the Leipzig League is conducting negotiations for renewal The representatives of the former left the room when the fee of 12 M per visit and 8 M per office call was suggested by the League. Recent proposals to enlarge the scope of state insurance had a tendency to eliminate private practice almost entirely

PNEUMOPERITONEAL ROENTGEN-RAY DIAGNOSIS *

ARTHUR STEIN, M D
Associate Gynecologist Lenox Hill Hospital and Harlem Hospital
AND
WILLIAM H STEWART, M D
Roentgenologist Lenox Hill Hospital and Harlem Hospital
NEW YORK

A quarter of a century has not yet elapsed since the discovery of the roentgen ray, but during this relatively short interval the adaptation of roentgenography to diagnostic purposes has rapidly progressed and many new fields of investigation have been opened up After a period characterized by many additions to and improvements on the apparatus and technic, an entirely new combined method of diagnosis has been found which assists the roentgen ray in the revelation of obscure diseased conditions by the inflation of body cavities with air or gas, thereby increasing to an extent hitherto unobtainable its scope and diagnostic efficiency Experience with this procedure, although as yet necessarily brief, would appear to justify the statement that its adoption already means a great step forward, and will probably come to be regarded as an epochal advance in diagnostic roentgenology

The development of this method has already been shortly outlined by us in a preliminary report [1] Since our adoption of this promising method in the spring of 1919, we have endeavored by improving on the technic to show distinctly the parenchymatous organs

Fig 1 (patient referred by Dr J F Connors)—Details of the abdominal organs in a child aged 7 years *A* liver *B B* diaphragms *C* heart *D* spleen, *E* coils of small intestine

themselves and their mutual relations, as well as pathologic changes of these organs and our experience with the application of this method of abdominal inflation to roentgenographic purposes has yielded very satisfactory results, and has more than justified our expectations as to its diagnostic value The procedure has been utilized by us in eighty cases, and

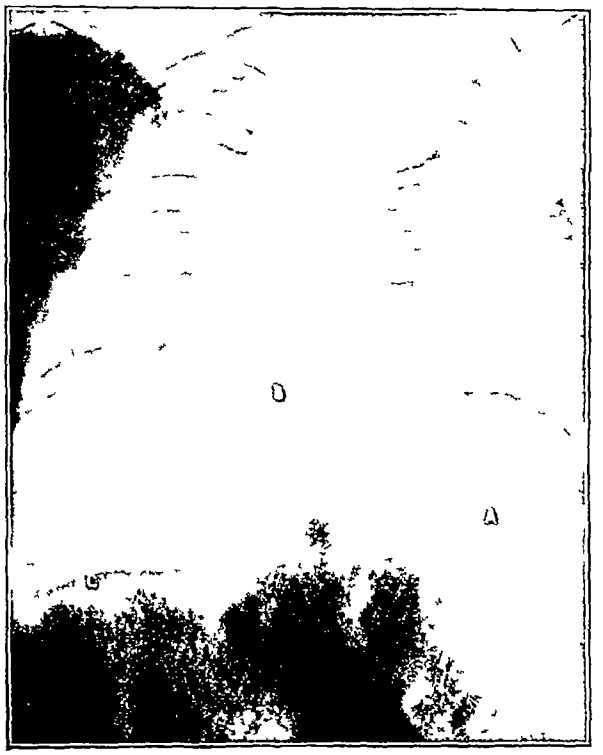

Fig 2 (patient referred by Dr Willy Meyer)—This roentgenogram taken without oxygen inflation shows a circular tumor in the lower portion of left chest Question Is the diaphragm above or below the tumor? *A* tumor, *B* heart *C* right diaphragm

without untoward effects The list includes patients varying in age from 4 to 74 years The feasibility of the method with children is well shown by a recent diagnostic inflation of a 9 year old boy with a possible indefinite right-sided mass in the region of the diaphragm, two weeks after the performance of an appendectomy The inflation was accomplished without the slightest difficulty and with no pain whatever to the patient, and it proved that no subdiaphragmatic condition was present The patient left the hospital cured, three weeks after the operation

We believe that the method should be reserved for those obscure cases in which a clearer outline than that which can be secured under the ordinary roentgenographic arrangements is desired

TECHNIC

Since our last publication on this subject we have further simplified the application of this method and by so doing have added to its safety, simplicity and efficiency Practically the only accessories now required are the lumbar puncture needle, rubber tube and oxygen tank In this respect we are in accordance with Rautenberg [2] who, in his latest contribution to this subject, has further simplified the technic of the method, the implements mentioned above being all that he now requires in its application

* Read before the Section on Surgery General and Abdominal at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

1 Stein Arthur and Stewart W H Ann Surg 70 95 (July) 1919 Am J Roentgenol N S 6 533 (Nov) 1919

2 Rautenberg E Pneumoperitoneale Roentgendiagnostik Deutsch med Wchnschr 45 203 (Feb 20) 1919 Neues zur Roentgenologie der Leber ibid 46 123 (Jan 29) 1920

The lumbar puncture needle and the rubber tube are thoroughly sterilized The tube is then connected with the oxygen tank and the apparatus is ready for application

The patient is prepared for this procedure as for any roentgen-ray examination by a thorough cleaning

Fig 3 (same patient as in Figure 2 inflated with oxygen) — diaphragm is below the tumor Roentgen diagnosis cyst of lung operative diagnosis tuberculous cyst of lung *A* tumor *B*, heart, *C* right diaphragm *D* liver, *E* left diaphragm, *G* spleen

out of the bowels and emptying of the bladder just before inflation We have also found it advisable to administer one-sixth grain of morphin half an hour before pneumoperitoneum is established

The usual point at which the needle is to be inserted is about one to two finger breadths below the umbilicus in the median line The skin in this vicinity is thoroughly cleaned with tincture of iodin Existing scars are to be avoided when inserting the needle, and that location should be selected where it is reasonable to expect that no adhesions will be encountered

We have found that a local anesthetic before introduction of the needle is entirely unnecessary Merely taking a fold of the skin tightly between the fingers is sufficient to counteract any pain on introduction of the needle

The needle should be slowly inserted as far as the fascia, the thickness of the abdominal wall being easily gaged by any surgeon A very gentle pressure will then ease the needle through the fascia and peritoneum into the abdominal cavity It is our custom to insert the needle always at a slightly oblique angle so that the point of the needle after entering the abdominal cavity remains as near to the parietal peritoneum as possible The free end of the rubber tube having been connected with the needle, the oxygen is then allowed to flow gently into the abdominal cavity The amount of gas varies from 2 to 4 liters according to individual conditions Observation of the patient's general condition will assist the surgeon to judge the fulness of the abdominal cavity We regard this method as strictly surgical and one that should be attempted only by one with surgical experience

The air or gas used in the application of this method does not necessarily need to be sterilized Rautenberg in his latest contribution [2] points out that the atmospheric air or oxygen which is introduced into the abdomen does not need to be filtered or sterilized, and Schmidt,[3] who in his application of the method uses ordinary unsterilized air, emphasizes the fact that such air never gives rise to the slightest infection or even irritation of the peritoneal cavity Our experience, based on eighty cases, fully confirms these statements

DANGERS

The whole method stands and falls with the question of any untoward effects or dangers that may be connected with it Experiments and our own practical experience have shown that the elasticity of the living intestine permits it to recede before a sharp intruding body such as a needle, and no trouble in this respect has ever been encountered by us The nonoccurrence of injuries when this method is used was demonstrated in Rautenberg's preliminary animal experimentation on guinea-pigs, nor were lesions of the omentum or small intestine demonstrable in a few patients who came to necropsy or operation some days after the

Fig 4 (patient referred by Dr Willy Meyer) —Cyst of liver proved at operation to be echinococcus cyst *A* liver *B* cyst, *C* stomach filled with barium *D* oxygen *E* descending colon

employment of this procedure We ourselves have looked for intestinal lesions in patients at the time of operation, but have invariably found the intestine unharmed The entire freedom from danger is also

3 Schmidt Adolf Ein neues Verfahren zur Roentgenuntersuchung der Bauchorgane Deutsch med Wchnschr 45 201 (Feb 20) 1919

emphasized by Alvarez [4] on the basis of personal experience

PAIN

We have noticed that about one third of our patients complain of marked pain in the shoulders following distention of the abdomen to its full capacity No

Fig 5 (patient referred by Dr Jacob Kaufmann) —Atrophic cirrhosis of liver *A* small contracted liver *B* oxygen

heart symptoms have accompanied the inflation except a slight rise in pulse Before using the deflation method, we found that occasionally the pain did not begin until late in the evening In this event, it is advisable to elevate the foot of the patient's bed in accordance with the principle that air always rises to the highest point, thereby confining the oxygen to the lower pelvis and reducing the pressure against the diaphragm If the deflation method is not used, the absorption of the gas within the abdominal cavity varies individually from several hours to a few days

That there is some discomfort to patients we do not deny However, we must refuse to accept as contraindicative to the method the slipshod application of it by physicians who are either too indifferent or too inexperienced to follow the technic carefully

DEFLATION

Of late, we have employed an extremely simple method to relieve the patient of any real or imaginary pain which might be connected with the procedure It is simply to deflate the abdomen after the roentgen-ray examination has been completed After the patient has been brought back to bed, the lumbar puncture needle is reinserted in the same manner as before, and the air is allowed to pass out through the needle This eliminates any possible discomfort to the patient, and adds distinctly to the simplicity of the method We have employed this procedure in all of our cases, to the full satisfaction of the patients and ourselves, since Feb 16, 1920 Tierney [5] has adopted a similar procedure

The need of careful technic with the adoption of strict aseptic precautions is illustrated by Hyman's [6] observation of a low grade peritonitis among his first patients We have had no similar experience, and in conformity with others who are utilizing the procedure we consider it entirely safe and devoid of danger when properly employed

ADVANTAGES OF PNEUMOPERITONEUM

The essential feature of the new method, aside from the introduction of a contrasting agent in the form of air or gas, consists in the resulting change in the position of the viscera in the distended abdominal cavity, the mass of intestinal coils in particular, which interfere with free inspection, being permitted to slip away as far as possible, regardless of whether the patient stands or is recumbent

This method of gas inflation of the abdominal cavity enables us at the present time to show all the parenchymatous organs which heretofore have not been rendered visible or plainly brought out on the roentgenogram We have shown the liver and, in many instances, pathologic enlargements and defor-

Fig 6 (patient referred by Dr Jacob Kaufmann) —Splenomegalia *A* enlarged spleen *B* liver *C* right kidney *D* left kidney *E* transverse colon filled with barium

mities of the gallbladder, and in several cases gallstones We believe, however, that even with the aid of oxygen inflation, it is difficult to detect many cases

4 Alvarez W C The Radiographic Study of the Abdominal Organs After Inflation of the Peritoneal Cavity California State J Med **18** 42 (Feb) 1920

5 Tierney J L Pneumoperitoneum J Missouri M A **27** 137 (April) 1920

of cholelithiasis, especially when the gallstones are of the same density as the surrounding tissues

Fig 7 (patient referred by Drs Max Einhorn and Frederick Kammerer) —Roentgen diagnosis tumor behind stomach operative diagnosis, retroperitoneal tumor probably glandular inoperable *A*, tumor, *B*, left kidney, *C* spleen, *D*, liver, *E* coils of intestines

The different varieties of splenic enlargement have been beautifully shown The diaphragm and subdiaphragmatic spaces have been clearly outlined In

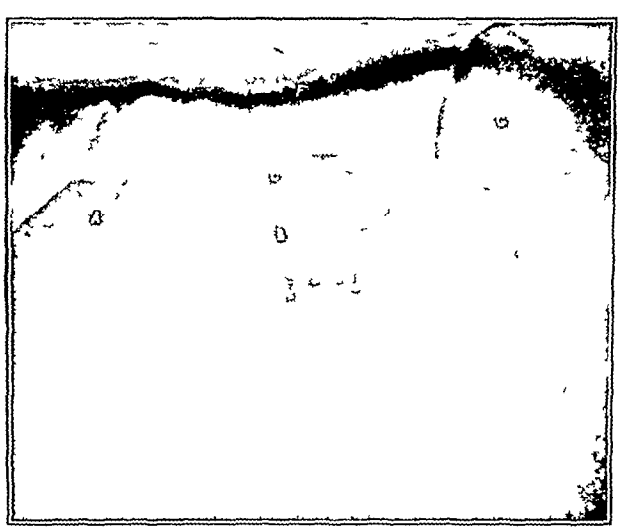

Fig 8 (patient referred to us by Dr F J Echeverria) Enlarged kidney hydronephrosis from kinked ureter (patient in lateral position) *A* liver *B* renal pelvis injected with thorium *C* outline of enlarged kidney *D* kink in ureter *E* oxygen *F* lateral abdominal wall *G* right ilium

many instances we were able to bring out the details of enlarged mesenteric glands, and in one or two cases the branches of the mesenteric artery were demonstrated

Cysts of the liver, prancreas and ovaries have been clearly shown, and malignancies involving the large and small intestine easily detected The female genital organs in their entirety, including tumors of those organs, have been visualized

Probably one of the most beautiful reproductions is the renal outline Pneumoperitoneum, when used in conjunction with pyelography, accurately outlines the renal pelves and calices, and at the same time shows with detail the renal structure, its enlargements and deformities

Changes of the vertebral column are also much more clearly revealed by this method than by the ordinary one One of the most valuable findings has been the actual demonstration of adhesions With special reference to adhesions, postoperative or the result of chronic inflammatory processes, we are inclined to believe, on the basis of personal findings,

Fig 9 (patient referred by Dr F J Echeverria) —Prolapse of right kidney with rotation *A* prolapsed and rotated kidney *B* right renal pelvis injected with thorium *C* opaque catheter in right ureter *D* liver *E* spleen *F* left kidney, *G* left renal pelvis injected with thorium *H* left ureter

that their existence involves no serious danger of perforating the intestine The clinical material at Harlem Hospital is rather abundant in this respect, and our list includes patients who have undergone three or even four laparotomies

CONTRAINDICATIONS

As to actual contraindications, the existence of acute abdominal conditions, such as acute appendicitis or peritonitis, naturally prohibits the employment of the method of abdominal inflation Nor should this procedure be carried out in known cases of valvular disease of the heart, for more work is required of this organ when the abdomen is inflated than under ordinary conditions Our experience has shown that a certain type of elderly persons, notably men who

have used alcohol in excess, does not readily lend itself to the employment of this method On the other hand, the average man, woman or child is a perfectly satisfactory subject and with the adoption of the deflation method described above, which will naturally follow as the method enters into more general practice, the performance of entirely painless inflations will soon become the rule

INDICATIONS

The indications for air inflation of the abdomen in connection with roentgenology have been slowly but considerably extended on the basis of growing experience as regards the harmlessness of the method and its wide sphere of usefulness Entirely new vistas have undoubtedly been opened up, and when the method is demonstrated it never fails to convey the impression of a new and promising domain in diagnosis At its present stage of development, however, the method should be reserved for the elucidation of diagnostic problems which have so far baffled the ingenuity of the clinician The roentgen-ray examination will in some of these cases reveal a distinctly surgical situation demanding operative interference for its relief In

Fig 10 (patient from Dr A Stein s service) —Postoperative adhesions *A* anterior abdominal wall *B* oxygen *C* adhesions

other instances many futile, inefficient or actually harmful operations will be abandoned on reception of the illuminating information furnished by the roentgen ray

The method should not be employed indiscriminately Its application should be reserved for suitable cases in which great advantage is seen to attend its adoption All new methods fall heir to the common fate of being held responsible for all accidents and untoward occurrences due to lack of practical experience In trained hands and with the employment of proper technic, there is every reason to anticipate the most gratifying results from this new adjuvant to abdominal diagnosis

48 East Seventy-Fourth Street—222 West Seventy-Ninth Street

ABSTRACT OF DISCUSSION

DR GEORGE E PFAHLER, Philadelphia In practically all instances we can demonstrate the lower border, sides and general outline of the spleen and liver by ordinary fluoroscopy or by plate methods But the pneumoperitoneal method is of a distinct advantage in demonstrating irregularities on the lower border of the liver, or on the right border of the spleen Its great advantage is in differentiating these dense shadows in the lower part of the chest from the solid tissues in the abdomen the liver or the spleen, also, in outlining any solid tumor enlarged glands or adhesions within the abdomen It seems to be safe When we have once eliminated the possibility of filling defects in the gastro-intestinal tract,

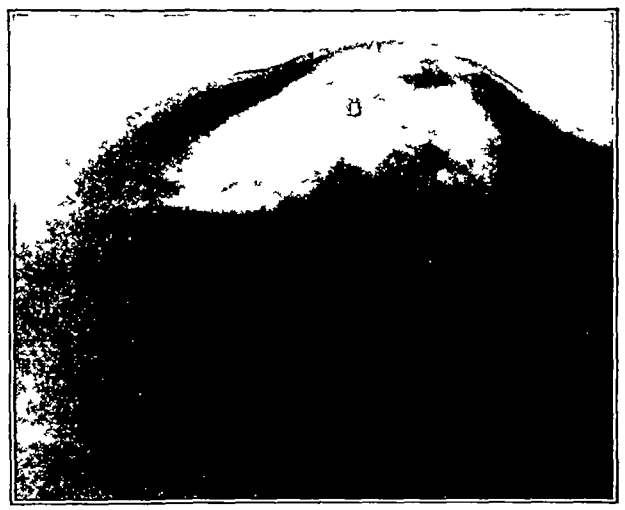

Fig 11 (patient referred by Dr I S Haynes) —Marked adhesions in large ventral hernia *A* thinned abdominal wall *B* intraperitoneal adhesions

and still must determine the pathology within the abdomen, this method is of distinct advantage What is done with the needle during the time that the patient is lying on the abdomen, and how is the air withdrawn from the abdomen later?

Fig 12 (patient from Dr A Stein s service)—*A* uterus *B* tumor of ovary *C* adhesions between uterus and ovary and between ovary and pelvic wall Operative findings cyst of ovary the size of a walnut omental adhesions between uterus and ovary and between ovary and pelvic wall

DR. B H ORNDOFF, Chicago I wish to draw a[tt]
to five points (1) Pneumoperitoneum the
value when used in the preparation of for
diagnostic investigation (2) Having

toneum more than four hundred times myself in connection with various pathologic conditions and without having a case where reaction of a serious character has been noted as the result of it, I am thoroughly convinced that when care is observed with regard to the technic of administration, it is a comparatively safe procedure (3) Pneumoperitoneum may be produced for therapeutic purposes, such as tuberculous peritonitis and other inflammatory conditions of the peritoneum, for the relief and prevention of peritoneal adhesions and in conjunction with radiotherapy, etc (4) For diagnostic purposes, pneumoperitoneum facilitates greatly the study of the abdominal viscera by means of the roentgen-rays (5) The necessity for special equipment designed to meet the requirements of a careful and complete study of the abdominal organs after pneumoperitoneum has been produced

DR WILLIAM H STEWART, New York Dr Pfahler mentioned the importance of this method of diagnosis only in those cases in which the information cannot be obtained by ordinary means This point cannot be emphasized too

Fig 13 (patient from Dr A Stein's service)—Uterine myoma with double (old) pyosalpinx *A* large myomatous uterus *B* right and left pyosalpinx (roentgen ray diagnosis confirmed at operation)

strongly By deflation we mean a reinsertion of the needle, after the roentgen-ray examination has been completed, for the purpose of drawing off the gas from the peritoneal cavity The needle is not left in situ after inflation on account of the damage that might be done to the viscera during the change of posture necessary in making the roentgen-ray examination Deflation relieves the tension and pain when present to such an extent that we now have hopes of making the method an office procedure We still insist that simplicity of the apparatus is essential Dr Rothenberg, one of the very early workers with this method, has now discarded filtration or sterilization of the gas as well as the use of any apparatus for measuring the pressure If one has the proper surgical experience there will be no difficulty in reaching the peritoneal cavity, we have never felt the necessity of injecting salt solution to ascertain this fact Our successful examination of eighty cases without a fatality occurring, is largely due to the simplicity of the method

SQUAMOUS CELL CARCINOMA OF THE KIDNEY

REPORT OF A CASE OCCURRING IN A HORSESHOE KIDNEY COMPLICATED BY A CALCULOUS PYONEPHROSIS *

ALEXANDER PRIMROSE, CB, MB, CM (EDIN)
Professor of Clinical Surgery, University of Toronto Faculty of Medicine, Surgeon Toronto General Hospital
TORONTO, ONT

Primary cancer of the kidney is not of frequent occurrence This is particularly true if we exclude hypernephroma, which in the literature of the past has frequently been described as a carcinoma of renal origin, but which most authorities now believe to be derived from suprarenal rests as first suggested by Grawitz Accepting this theory regarding the origin of hypernephromas as correct, we may state that a primary cancer originating in kidney tissue is derived from the epithelium of the renal tubules

The occurrence of a squamous cell carcinoma in the kidney is excessively rare, and it becomes a subject not only of interest but of considerable practical value to trace its origin and to study the etiologic factors which lead to its production Kundrat [1] described the condition in 1891 A perusal of the literature leaves no doubt in one's mind that such tumors arise from the transitional epithelium of the renal pelvis We may accept the classification of Graupner,[2] who, in studing the histogenesis of primary renal cancers, divided them into two groups (1) infiltration carcinoma, and (2) adenocarcinoma The former are derived from the renal pelvis primarily, and the latter from the renal tubules

The case herewith recorded is of further interest because it was associated with a calculous pyelitis The presence of stone in the kidney plays an important role in the production of cancer, thus, in the Mayo Clinic not less than 50 per cent of all cases of epithelial cancer of the kidney which have come to operation were superimposed on extensive renal calculous formation In addition, my patient exhibited the unusual anomaly of a horseshoe kidney, a condition which, according to Adami,[3] is present in 0 4 per cent of necropsies

REPORT OF CASE

Examination—Mrs F J S, aged 58, came to me in January, 1919, complaining of pain in the back and right side She stated that since early childhood, or as long as she could remember, she had had some distress in that region She had an abdominal tumor visible to the eye Its most prominent portion was behind the right rectus muscle, below and to the right of the navel It could be palpated through to the loin, there was dulness in the flank and resonance on percussion over the outer portion of the tumor There was also a definite projection of the tumor across the middle line to the left side, extending fully 7 cm to the left of the linea alba Percussion over this part of the tumor elicited resonance An area of resonance existed above, between the tumor and the liver One could detect fluctuation through the tumor from the anterior portion back to the loin The patient had some slight evening elevation of temperature, and she had lost 20 pounds in weight

3 Adami J G and Nicholls A G The Principles of Pathology Ed 2 Philadelphia, Lea and Febiger 2 728 1909

My colleague Dr W W Jones, made a cystoscopic examination and found the bladder healthy in appearance Urine flowed freely from the left ureter and proved to be normal on analysis The phenolsulphonephthalein test came through in six minutes The catheter passed into the right ureter more than half an inch There was absolutely no flow of urine from the right ureteral orifice The roentgenogram showed a stone about the size of a filbert in the center of the tumor behind the outer part of the right rectus muscle A second shadow of a stone, somewhat larger, was seen in the middle line or slightly to the left of the middle line

Operation and Results—Jan 13, 1919, an oblique incision was made over the anterior surface of the tumor When the peritoneum was opened the tumor was found to be retroperitoneal and to extend across the spinal column into the left lumbar region Its main bulk, however, was to the right of the spine, where it lay in the right lumbar space as an elastic mass obviously containing fluid A very careful inspection was then made of the entire tumor It consisted of two portions, one occupying each lumbar region and connected by a broad thick bridge of tissue The bridge was so thick and broad that there was little differentiation between it and the two masses which it connected The left lumbar region was carefully explored to make certain that there was no further evidence of a left kidney behind It became obvious that we were dealing with a horseshoe kidney I then incised the posterior parietal peritoneum over the face of the cyst to the right of the ascending colon, after which I marsupialized this by uniting with suture the margins of the incision in the posterior peritoneum to that in the anterior peritoneum Thus the general peritoneal cavity was completely closed off from the field of operation I cut through a further covering of the cyst consisting of the fatty capsule which was about 2 mm in thickness I inserted a large trocar and drew off yellow purulent looking material which was watery in consistency I then incised the cyst I found a mulberry calculus about the size of a filbert lying free in the cyst cavity I explored the interior of the cyst with my finger and discovered another stone projecting into the cyst cavity from a solid part of the tumor which lay anterior to the spine Thus was fixed in position While attempting to mobilize this with my finger I fractured a piece from a portion which lay still deeper and which I could not dislodge The patient was a poor operative risk and I desisted from any further extensive operative interference I dissected out a considerable portion of the cyst wall, including a thickened band of tissue which lay across it obliquely The remaining portion of the cyst wall was uniformly about 3 mm in thickness I overcast the cut edge of the cyst wall with catgut for hemostatic purposes and inserted a drainage tube before closing the wound During the operation I found on the outer surface of part of the cyst wall an area about 2 cm. in diameter and raised from the surrounding surface for about 3 mm This was yellowish gray, and possessed a tubercular surface During the operation, 40 ounces of physiologic sodium chlorid solution were administered interstitially The fluid content of the cyst was analyzed by Professor Hunter, who reported "The fluid had a specific gravity of 1 010 and a faintly alkaline reaction It contained traces of urea and other urinary constituents, but its chief soluble component was protein The total quantity of this present was 1 75 per cent It was partly nucleoprotein, but chiefly coagulable protein (albumin)"

Subsequent to the operation drainage was maintained and after the lapse of two months the patient's general condition had improved but there was still a considerable amount of discharge and some absorption as indicated by an evening rise of temperature to 100 or 101 F A roentgenogram taken at this stage showed a shadow cast by stones near the middle line of the body, but in consequence of the contraction of the pyonephritic sac toward the opening in the right abdominal parietes to which it had been sutured the shadow was drawn well to the right of the middle line and therefore appeared to be quite accessible to the finger introduced into the sinus opening thus making it possible to remove it with safety by a comparatively slight operation Accordingly March 20, under gas anesthesia, I enlarged the drainage opening sufficiently to admit two fingers I located the stones and by scratching through the kidney substance surrounding them, using the bare ungloved finger for the purpose, I succeeded in enucleating from its bed a calculus the size of a large walnut It was surrounded by many small calculi varying in size from a grain of rice to a small pea These were removed along with a considerable amount of gritty material which was taken out by curetting with a scoop followed by gauze on forceps Presumably, the stones lay in the pelvis of the right kidney

On the posterior wall of the cavity adjoining the pocket that had contained the stones, I detected a somewhat prominent mass of tissue which I took to be kidney substance I attempted the removal of a portion of this tissue in order that I might determine by microscopic section, the nature of the condition present I enucleated a piece about the size of a walnut This was preserved for future examination Hemorrhage was slight and was easily controlled I closed the wound still maintaining drainage as before There was no evidence of metastases

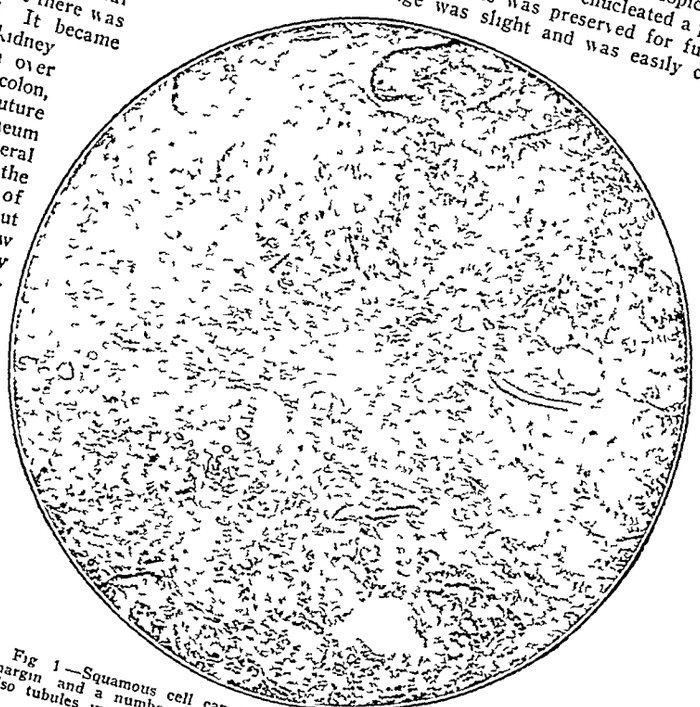

Fig 1—Squamous cell cancer of the kidney tumor growth at margin and a number of sclerosed and partially sclerosed glomeruli also tubules invaded by the growth × 50

At the time of the first operation a guinea-pig was inoculated from the pus contained in the cyst The pig was killed eight weeks subsequently, but was found negative for tubercle bacilli

The sinus continued to discharge, but the patient's general nutrition was maintained for about five months after the operation when she began to fail Toward the latter part of her illness, she developed a fecal fistula, while a tumor growth of a very hard consistency developed She died eight months subsequent to her first opertion It was impossible to obtain a necropsy

Microscopic Examination—The tissue removed at the second operation proved to be a squamous cell carcinoma The kidney substance in this section was infiltrated and almost destroyed by epithelial cells which showed marked pearl formation (hornification) several areas showed epithelial cells growing in the dilated lumen of the tubules surrounding the epithelial cell nests A marked fibrosis had

occurred which replaced most of the kidney substance Dotted through the section were dilated glomeruli showing atrophic changes, and around several of these glomeruli there was a round cell and plasma cell infiltration, as shown in the accompanying photomicrographs The condition was one with which we had hitherto been unfamiliar

ORIGIN OF THE DISEASE

We may assume at the outset that squamous cell cancer of the kidney has its origin in the pelvis or calices of the kidney We can better understand the validity of this assumption by a study of the conditions antecedent to its production

The normal histologic structure of the mucous membrane of the renal calices, pelvis and ureter is a transitional epithelium, of a character similar to that found in the bladder It is therefore not surprising that the histologic structure of new growths originating from the mucous membrane of these urinary passages has very similar characteristics A villous papilloma is a benign growth of frequent occurrence in the bladder, and has also been found as a primary growth in the ureter, pelvis and calices That a villous growth may develop into a malignant tumor was demonstrated by Virchow Villous tumors of the ureters have been described by Poll,[4] de Josselin de Jong,[5] Stoerk,[6] Kohlhardt,[7] and others The epithelium in these cases may resemble that of the normal mucous membrane, or may vary within wide limits, being cylindric, cubical, spindle shaped or polygonal, not infrequently different types of cell are present in the same tumor On the other hand, a malignant squamous cell cancer has been found in the urinary passages without villous formation A notable example of this was placed on record by Rundle[8] In his case, the lower 3 inches of the right ureter were involved in a large growth which extended down to within 1 inch of the bladder, a small polypoid growth the size of a pea protruded into the bladder through the ureteral orifice The interior of the ureter, almost up to the renal pelvis, contained numerous small, isolated nodules These multiple tumors presented the histologic picture of a squamous cell cancer Wilson[9] of the Mayo Clinic describes a similar squamous cell epithelioma of the renal pelvis, resembling histologically a cancer of the lip Hektoen[10] records a case of primary cancer of the lower end of the ureter containing cells of different types, oval, spindle and club shaped, he states that, in places, masses of cells showed degenerative changes which might in some instances be mistaken for epithelial pearls

The occurrence of new growth in the calices and the pelvis of the kidney is associated with chronic inflammatory changes due to some form of irritant The frequent association of stone with this condition is noteworthy Calculi were present in the case here recorded Hartman[11] describes a case of primary cancer of the renal pelvis associated with calculous pyelitis Kischensky[12] found the ureter blocked with calcareous concretions, and Scheel,[13] although he did not find a stone, suspected one had been present at an earlier date from the previous history of pain, etc Wilson[9] mentions two cases superimposed on extensive renal calculous formation In most instances, the subepithelial connective tissue exhibited a round cell inflammatory infiltration (Scheel,[13] Kischensky,[12] Stoerk,[6] and others) The most noticeable feature in this regard, however, is the associated proliferation of the transitional epithelium of the ureter, pelvis and calices This was present to an exaggerated degree in Kischensky's case in which, associated with a squamous cell cancer of the calices of the kidney, there were extensive metaplastic changes in the epithelium of the calices, pelvis and ureter Thus the wall of the ureter presented, under the microscope, a cutis-like formation with extensive cornification of the superficial layers of cells, the deeper layers were more or less cylindric, while the superficial layers were composed of pavement epithelium, exhibiting cornification on the surface Some of the cells of the deeper layers exhibited bridges, giving the appearance of prickle cells In the renal pelvis, there was a calcareous incrustation, over which were found pus cells Rokitansky[11] describes a condition in the renal pelvis in which from the proliferated epithelium there is much desquamation, these desquamated cells are massed together with much detritus and cholesterin crystals, producing the condition which he describes as cholesteatoma

Baselin [14] records a similar condition which he calls cholesteatomatous desquamation of the cells of the pelvis associated with primary tuberculosis of the kidney

The epidermization of the transitional epithelium in the ureter, pelvis and calices may thus proceed with a high degree of cell proliferation, in which the superficial layers are hornified Halle [11] has suggested for this condition the name leucoplasie urmaire, resembling the so-called leukoplasia of the mouth cavity, which is not infrequently recognized as a precancerous condition

The fact that squamous cell cancer of the kidney is due to the invasion of the kidney substance by a growth which is primary in the pelvis and calices is attested by the findings in certain of the reported cases Scheel,[13] for example, records a case of a tumor which presented the characters of a squamous cell epithelioma of the kidney substance, showing pearls and hornification This was in direct continuity with a tumor of the kidney pelvis in which the cells were mostly cylindric in type, and which developed as a villous growth, these cells were supported on a vascular connective tissue which was infiltrated by a growth of squamous cells with pearl formation and basal cells Between the squamous cell growth of the kidney substance and the tumor of the pelvis there was almost everywhere a sharply defined barrier of connective tissue, but in certain places this barrier was broken down and the two growths become continuous Scheel considers the two growths of common origin, and concludes that the original tumor was an epithelioma arising probably in connection with the kidney calices and developing, on the one hand, as a cylindric cell papilloma invading the kidney, pelvis, and on the other hand, as a squamous cell cancer of the kidney substance Hildebrandt [15] describes a large growth which in its pelvic portions was papillary and in the renal substance scirrhous (Ewing [16]) Cylindric cell papillomas in the pelvis and ureters have been described by several writers Rundle's case, already quoted, gives us an example of a squamous cell growth ocurring in the ureter without villous formation

Busse [17] describes a case of squamous cell cancer of the bladder associated with papillomatous growths in the ureter

It would appear, therefore, that squamous cell cancer of the kidney substance is derived from a primary growth in the calices or pelvis, this in turn may be accompanied, as in Kischensky's case, with extensive metaplasia and epidermization of the epithelium of the calices, pelvis and ureters

These squamous cell carcinomas of the kidney or pelvis are accompanied by extensive metastases In the case recorded in this paper it was impossible to establish the existence or nonexistence of these, as it was impossible to obtain necropsy In Scheel's [13] case, metastases occurred in the liver, the lung and the hilum glands In Kischensky's [12] case they were present in the liver, the hilum glands and in the lower end of the femur In all instances the metastatic growth exhibited the characteristic structure of squamous cell cancer

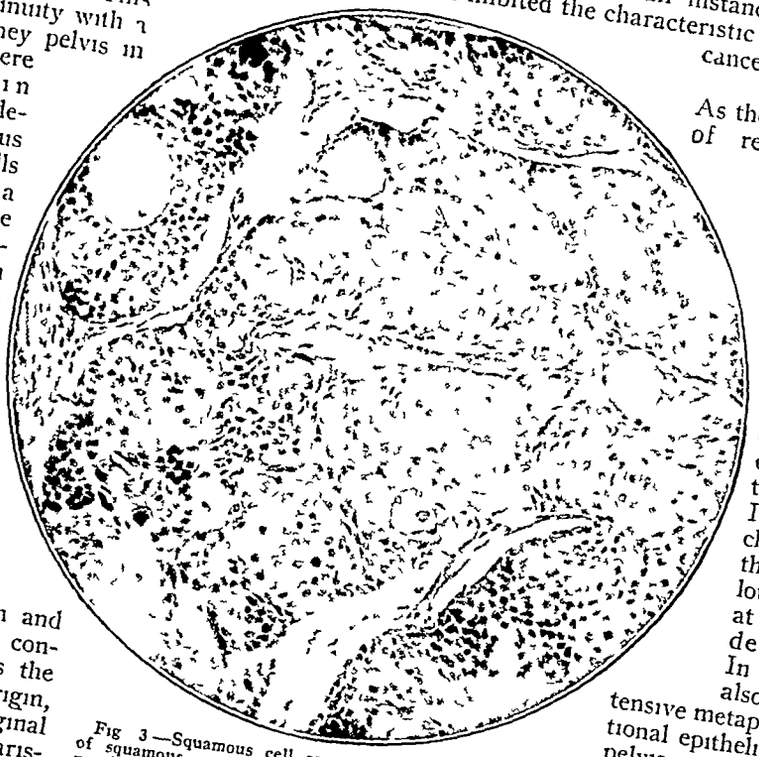

Fig 3.—Squamous cell cancer of the kidney masses of squamous epithelial cells with pearl formation also renal tubules × 130

CONCLUSIONS

As the result of a critical study of recorded cases we may arrive at the conclusion that the usual form of renal tumor described as squamous cell cancer is a growth having its origin in the transitional epithelium of the calices and renal pelvis with subsequent invasion, by direct extension, of the kidney substance Its development is closely associated with the production of villous growths which, at first benign, may develop malignancy In certain instances also there may be extensive metaplasia of the transitional epithelium of the calices, pelvis and ureter The entire process is probably preceded by chronic inflammatory changes produced by some irritant, such as the presence of stone

ABSTRACT OF DISCUSSION

DR ARTHUR DEAN BEVAN Chicago Twenty-five years ago we did not have the same conception of kidney tumors that we have today I had an opportunity to work in Birch-Hirschfeld's pathologic institute in Leipzig when he was doing a great deal of work on hypernephroma He coined the word A large series of cases reported by Israel then were mostly considered carcinoma then sarcoma, but after the work of Birch-Hirschfeld, Israel studied his specimens again, and instead of reporting carcinoma as a common type of malignant tumor of the kidney, he labeled these cases hypernephroma For a number of years we have accepted the view that hypernephroma is a common type of malignant tumor of the kidney Of more than one hundred cases of malignant tumors of the kidneys in my own service, hypernephromas numbered more than 80 per cent of the total cases, sarcoma, occurring early in life formed the second group Carcinomas are exceedingly rare I have had only four cases in which the microscope showed carcinoma The type of carcinoma has been for the most part the same

as is found in the bladder and, occasionally, in the ureter It is not at all surprising that under certain conditions metaplasia takes place Years ago it was pointed out that metaplasia occurred in the epithelium of the gallbladder and that squamous carcinoma developed Today that is a well-recognized fact Another interesting fact is the development of leukoplakia in the bladder, ureter and pelvis of the kidney, especially in the presence of chronic irritation A number of cases of epithelioma of the body of the uterus from chronic irritation from the stem pessary have been reported

DR WILLIAM J MAYO, Rochester, Minn We can get a better idea of the solid tumors of the kidney by going back to the embryology of the organ I agree with Cushny that the kidney is essentially a filter That part of the kidney which rises from the diverticula of the wolffian duct and is lined originally by pavement epithelium forms the part of the kidney that collects the urine, that is, the pelvis, the calices and the straight tubules, and from these tissues originate the transitional forms of carcinoma Dr Primrose described I agree with Dr Bevan as to the great frequency of the so-called hypernephroma These tumors are mesotheliomas derived from the filter part of the kidney as shown by Wilson, and not hypernephromas Merely because it was noted that their structures were arranged in parallel columns and were yellow, they were believed to have their origin in suprarenal rests The little yellowish bodies believed to be suprarenal rests are found in the capsule, while the tumors themselves are found in the substance of the kidney The case that Dr Primrose reported is exceedingly interesting because the tumor occurred in a horseshoe kidney which would add greatly to the difficulties of removal We have observed a small number of such tumors, but none in horseshoe kidneys The operations have been exceedingly difficult In some of our cases, in which the right kidney was involved, the retroperitoneal part of the duodenum was injured in an attempt to remove it In one case, the injury was due to rat toothed forceps hastily applied to check hemorrhage, necrosis and leakage followed and in two weeks the patient lost almost all the superficial epithelium of the body The patient died In the second case, after the fistula had occurred, I made an incision in front, dissected the duodenum up closed the fistula and tucked the omentum around it, this patient recovered I have since seen two similar cases and have known of a number of other cases of this type of malignant disease involving the pelvis of the kidney in which the accident happened in attempts to perform nephrectomy and except in the cases in which a second operation was made in front and the fistula closed by suture, the patients died The vena cava may be injured in the removal of these tumors on the right side This accident is not necessarily a fatal one It is surprising how readily the vena cava may be mended, it can be picked up between the fingers and can be sutured with catgut care being taken that the endothelium on the inside of the vessel is brought into contact In exactly the opposite of the method of suturing the intestine big notches involving nearly a half of the lumen may be left without harm

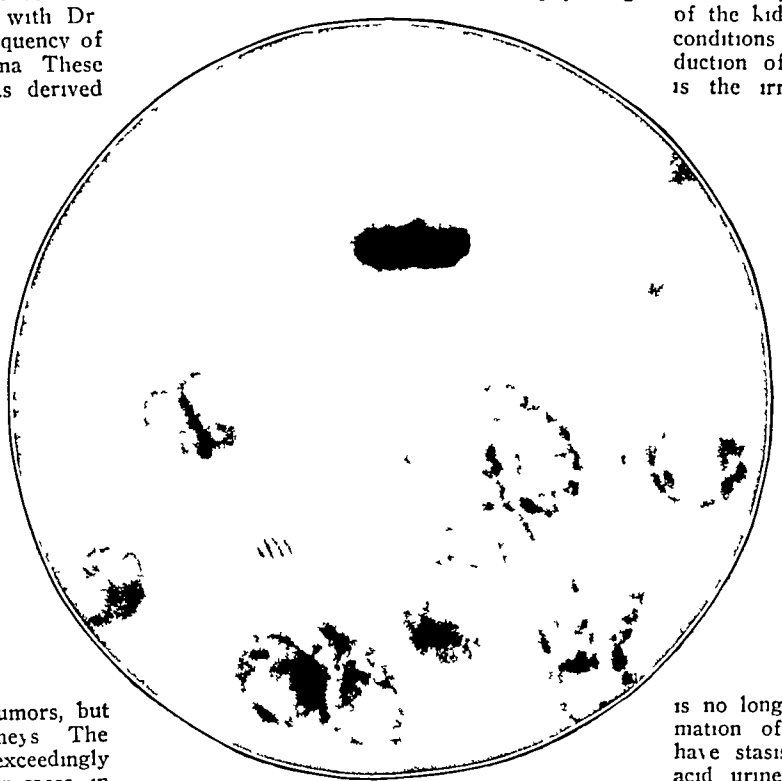

Fig 4—Squamous cell cancer of the kidney a number of mitotic figures (monaster) a number of these are found throughout the tumor showing a fairly rapid growth × 2 000

DR JOHN J GILBRIDE, Philadelphia There may be considerable difficulty in making a diagnosis because of the absence or almost complete absence of local signs or symptoms in the early stages of the disease, even after one has been able to palpate a definite mass in cases of hypernephroma or sarcoma of the kidney There may be an absence of blood or other changes in the urine until the case is so far advanced that the patient practically dies of suppression of urine and the symptoms are those of uremic coma In malignant disease of the kidney one frequently finds a slight elevation of temperature, perhaps 99 or 99 5 or a little higher, together with an increase in the pulse rate —up to 80 90 or even 100—suggesting the presence of an infection Even after extensive study and careful roentgenray examination I have seen cases of malignant disease of the kidney in which a diagnosis of infection had been made

DR ALBERT J OCHSNER, Chicago I wish to direct attention to the physiologic reason why the squamous cancers of the kidney are so rare Three conditions help to favor the production of cancer One of these is the irritation which we have here in the presence of stone in the pelvis of the kidney constantly The second one is the stasis found in the production of cancer in every cavity where it occurs The third is the acid medium In the kidney an acid medium is present all the time so long as the urine is normal, but so long as the urine is normal even in the presence of uric acid stone or oxalate of calcium stone, the irritation is slight because there is constant washing away of the surface by normal urine On the other hand, as we have the development of stasis we have alkaline urine and the condition is no longer favorable to the formation of cancer If we could have stasis and irritation and an acid urine at the same time, in this location, there can be no doubt that squamous carcinoma of the pelvis of the kidney would be common

---

Symptoms of Breast Cancer—The so-called classical symptoms of the textbooks are positively dangerous from the point of view of prognosis To wait for their appearance is, in many cases, to wait till the disease is well-nigh incurable The early signs of breast cancer are symptomless, the accidental discovery of a lump in the breast is usually the first sign of trouble Pain is very rarely present at this stage, and here be it noted how extraordinarily difficult it is to convince many women of the very serious nature of a lesion which is causing no discomfort! The only other sign of breast cancer with which I am acquainted is dimpling of the skin of the breast over the tumor, this is never to be seen over nonmalignant tumors unless they have become infected On the presence of a single hard lump in the breast of any woman over thirty years of age I am prepared to suspect cancer, if the skin dimples over the lump, I believe she has cancer and that the least possible delay should take place in operating if our patient is to have a permanent cure—W Doolin *Med Press* April 28 1920

SYPHILIS OF THE KIDNEY*

LOYD THOMPSON, M D
HOT SPRINGS, ARK.

The majority of textbooks on general medicine give but scant attention to the subject of syphilis of the kidney. Even the latest edition of Osler,[1] that great storehouse of medical information, devotes only two short paragraphs to its consideration. The same statement may be made concerning most textbooks on genito-urinary diseases, although in Cabot's[2] "Modern Urology" there appears a quite comprehensive description of renal syphilis. Even in the periodical literature of the last decade are to be found comparatively few references to the subject. It is therefore apparent that the importance of syphilis of the kidney is often overlooked, both by the internist and by the genito-urinary specialist, so it seems opportune at this time to review rather completely our knowledge of the subject and to add some personal observations.

INCIDENCE

The incidence of syphilis of the kidney is difficult of determination, as statistics concerning its frequency are not common. Spiess,[3] in 1877, published the necropsy findings in 220 syphilitics in which the kidneys were affected as indicated in the accompanying tabulation.

CONDITION OF KIDNEY IN TWO HUNDRED AND TWENTY SYPHILITICS

	No.
Parenchymatous nephritis	21
Interstitial nephritis	16
Sclerogummatous nephritis	7
Sclerosis	18
Atrophy	11
Amyloid degeneration	42
Various inflammations only partly attributable to syphilis	16

Warthin[4] found changes in the kidneys, chronic passive congestion, atrophy, infarctions, and local and diffuse inflammations in practically all kidneys of syphilitics. In the first forty-one cases studied, there were seventeen cases of acute, subacute and chronic parenchymatous nephritis, and three cases of interstitial nephritis. This author states, however, that the relation of the syphilis to these conditions is not apparent.

Osler[1] states that it has been estimated that acute syphilitic nephritis occurs in 3.8 per cent of all syphilitics in the so-called secondary stage. This figure would seem to be entirely too high, as it has been shown by Karvonen,[5] Cole[6] and others that acute syphilitic nephritis is a comparatively rare condition. In an observation of several hundred cases of early syphilis, I have seen but one case of acute involvement of the kidney, although a number of cases have shown mild transient albuminuria.

HISTORICAL

The early syphilographers apparently did not recognize syphilis of the kidney, and even Astruc,[7] whose "De morbis venereis," published in 1736, contains many references to visceral syphilis, is silent on the subject. And although Morgagni[8] as early as 1761 pointed out that the kidney could be attacked by the syphilitic process, John Hunter,[9] in 1786, wrote that he had never seen the kidney and other viscera involved, but that such cases had been described.

To Rayer,[10] however, in 1840, belongs the honor of first recognizing syphilis of the kidney clinically, although, according to Lancereaux,[11] Wells, Blackwell and Gregory of England had already observed changes in these organs in venereal disease which they attributed to the action of mercury used in treatment rather than to the syphilis itself. Lancereaux, himself, recognized three forms of syphilis of the kidney, namely, diffuse interstitial nephritis, gummas and cicatrices, which are the end-results of the preceding forms.

Since the time of Lancereaux, the knowledge of kidney syphilis has been gradually increasing, both from the anatomic and the clinical points of view, and I will now attempt to describe the various types that have been observed.

PATHOLOGY

Syphilis of the kidney may be divided into these varieties:

I. Early involvement
   1. Transient albuminuria
   2. Acute and subacute nephritis

II. Late involvement
   1. Chronic interstitial and parenchymatous nephritis
   2. Amyloid kidney
   3. Gummas

The pathology of the transient albuminuria, seen early in the course of syphilis, is comparable to similar conditions observed in other infectious diseases. It is probably not due to the actual invasion of the kidney by spirochetes, but is due to the toxins generated by these organisms during the course of the general infection. The condition represents the response of the tissues to the irritation, and there are degenerative changes in the epithelium of the convoluted tubules, and small quantities of coagulated serous exudate in the glomeruli.

Acute syphilitic nephritis presents a pathologic picture similar to that found in other types of acute nephritis. The kidneys are enlarged (large, white kidney), the cortex thickened, and the capsule strips easily. On section, the parenchyma is seen to be of a gray, homogeneous color. Histologically, the lining epithelium of the convoluted tubules is swollen, granular and often completely destroyed. There is a marked infiltration of lymphocytes and some polymorphonuclears, while the arteries usually show a beginning endarteritis. The glomeruli are usually not markedly involved, but sometimes they are increased in size and consist almost entirely of polymorphonuclear leukocytes in various stages of degeneration. There is a more or less marked interstitial edema. Spirochetes have been demonstrated by LePlay and

Sezary [14] in the kidney of a patient dying of acute nephritis, while Dreyer and Toepel,[13] and later Hoffmann,[14] found these organisms in the urine of patients suffering with syphilitic nephritis

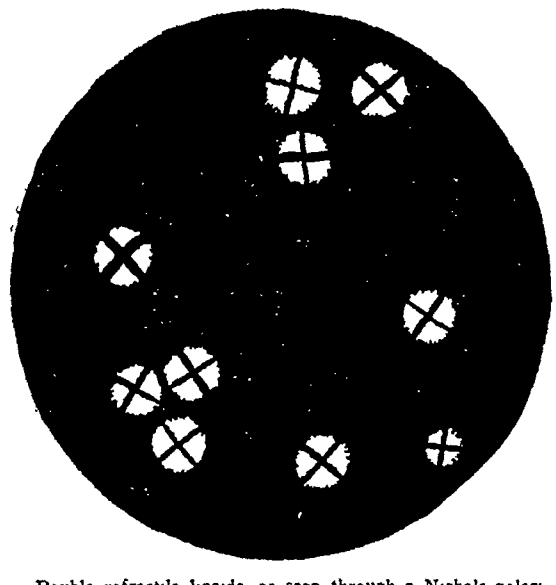
The picture in the subacute type of syphilitic nephritis is similar to that found in the acute, but the glomeruli are involved more severely in the process

Chronic syphilitic nephritis occurs both in the interstitial and the parenchymatous forms, although the two are more or less associated The kidneys are usually of normal size, although they may be either increased or diminished, and are of pale color and firm consistency Histologically, the picture does not differ from chronic nephritis due to other causes

Amyloid kidney is the result of long-continued toxemia, and that due to syphilis differs in no respect from amyloid kidney of other etiology Faroy [15] was able to demonstrate spirochetes in small numbers in the amyloid kidneys of a woman in whom other evidences of syphilis were found at necropsy

Gummas of the kidney are rather rare, but do occur either as single or multiple tumors, and vary in size from 1 or 2 mm to several centimeters In Bowlby's [16] case a gummatous tumor of the right kidney, weighing 17 ounces, was removed at operation Gummas are found both in the cortex and in the medulla, and appear as pale, yellowish nodules Histologically they are the same as gummas of other locations

Not infrequently the kidneys of syphilitics present a sclerogummatous process in which, in addition to small multiple gummas, there is a diffuse atrophic sclerosis with hyaline degeneration of the glomeruli, and atrophy of the convoluted tubules There are also fatty degeneration of the epithelium of the tubules and endarteritic changes in the blood vessels, even complete obliteration



Double refractile lipoids as seen through a Nichols polariscope from a case of subacute syphilitic nephritis

CLINICAL HISTORY

There is little or no symptomatology connected with the early transient albuminuria of syphilis other than the small amount of albumin in the urine This is of quite frequent occurrence, and would probably be more often recognized if the urines in all cases of early syphilis were examined It is observed during the second incubation period, but more frequently as an accompaniment of the early cutaneous manifestations Casts are rarely demonstrated, and other urinary findings are nil

Acute syphilitic nephritis may occur at any time following the chancre, in some instances before the cutaneous manifestations Audry [17] reported two such cases Of twenty-six cases occurring during the first year seen by Fournier,[18] eleven developed in the second month, while Mauriac [19] states that acute syphilitic nephritis may occur as late as three years after infection However, the average date of onset is about the fifth month, which was the date of my case, and this disorder is rarely seen after the first year

The onset is generally insidious, although rarely it may be sudden The first symptom to be observed is usually edema, which may develop rapidly, producing general anasarca and even ascites and hydrothorax There is moderate asthenia, though the general condition of the patient is remarkably good, in view of the kidney involvement Anemia and loss of weight are sometimes more or less prominent symptoms In those cases which develop suddenly there are usually severe pains in the lumbar region, anorexia, fever and perhaps nausea and vomiting

The urinary findings are similar to those observed in other types of acute nephritis Oliguria is usually present, the total quantity of urine excreted during twenty-four hours sometimes running as low as 300 c c or less It may be smoky, but more frequently is clear, amber and of high specific gravity The most striking feature is the enormous quantity of albumin, sometimes being so great as to coagulate on boiling so that the urine cannot be poured from the tube Hoffmann [14] has seen the albumin content from 3 to 13 per cent, while in Cole's [6] case it was 15 per cent In my case it was 3 2 per cent Tube casts of all kinds, particularly the fatty variety, are observed in the sediment, although the number of casts is not nearly so striking as the quantity of albumin A few red blood cells and leukocytes to a greater or less extent are also found Epithelium cells usually are numerous Munk called attention to the presence of lipoids observed as fine droplets or in packets, either in the epithelial cells or in the casts which are doubly refractive through a Nichols polariscope Under the ordinary microscope these droplets resemble neutral fat globules, varying in diameter from that of an erythrocyte to three or four times that size, but when examined with the polariscope they show a dark central cross separating four bright peripheral quadrants While Munk [20] found these lipoids in the urine of several cases of nephritis of nonsyphilitic origin, they were more abundant in syphilitic nephritis This is in accord with the findings of Stengel and Austin,[21] as well as my own

Renal function seems to be considerably less impaired than in acute nephritis of other etiology

In my case the phenolsulphonephthalein excretion was 50 per cent in the first hour and 25 per cent in the second (subcutaneous)

Chronic syphilitic nephritis is of comparatively infrequent occurrence, and is usually seen from three to ten years following the infection It may, however, occur earlier In one of my cases albumin was found in the urine eighteen months after the appearance of the chancre, and in another one eight and one-half years The symptoms will depend on whether the interstitial or the parenchymatous variety predominates In the former case it is characterized by polyuria, small amounts of albumin, few hyaline casts, and little or no edema, but high blood pressure In parenchymatous nephritis the urine is scanty, of high specific gravity, and contains more or less albumin, and usually hyaline and granular casts There is usually edema, and the blood pressure is increased, while anemia is more or less marked

Amyloid kidney is also of late occurrence in syphilis, and is characterized by a large amount of albumin in the urine, which is usually diminished in quantity, but may be increased There is generally more or less anemia and edema of the face and legs The blood pressure is normal or low

Gummas of the kidney occur late in the course of the disease, rarely before the fourth or fifth year, and will cause symptoms depending on their size and location They may sometimes cause symptoms resembling renal calculus Occasionally they develop to such a size that they are palpable

In Bowlby's [10] case a woman, aged 40, had noticed a swelling in the right renal region for three months, which caused some discomfort The right kidney was movable, usually hard, and a little enlarged Except for a trace of albumin, the urine was normal and the patient was otherwise in good health A year later the tumor had grown considerably larger and was more painful, while the urine was normal in quantity, but contained a trace of albumin At this time a definite history of syphilis twenty-one years previous was obtained Nephrectomy was performed, a tumor weighing 17 ounces removed, and the patient made an uneventful recovery

DIAGNOSIS

The diagnosis of the early transient albuminuria of syphilis, when occurring as an accompaniment of the cutaneous manifestations, is, as a rule, easy, and this condition should be recognized in all cases That occurring prior to the cutaneous outbreak, however, may be more difficult of recognition, although a slight albuminuria with few or no casts without other obvious etiology should arouse suspicions of syphilis, and a thorough investigation for that disease should be instituted

Acute syphilitic nephritis must be differentiated from acute nephritis of other etiology, and, as with the transient albuminuria, when it occurs as an accompaniment of cutaneous lesions this is usually easy, although the fact must not be lost sight of that acute nephritis of other etiology may occur in a syphilitic And, furthermore, as Hoffmann [14] has pointed out, the edema may be so great as completely to mask the skin and mucous membrane eruptions

A nephritis occurring in an individual without the cutaneous manifestations of syphilis, of insidious onset, with marked edema and large quantities of albumin, with few casts, comparatively little general disturbance and only moderate lowering of renal functions, should arouse suspicions of syphilis The finding of double-refractile lipoids or spirochetes in the urine, or a positive Wassermann test would be most suggestive, although, as pointed out above, double-refractile lipoids are found in other types of nephritis, and it must be remembered that spirochetes in the urine need not necessarily come from the kidneys However, if found in a specimen of urine obtained by ureteral catheterization, the diagnosis of syphilitic nephritis would be almost certain

Probably the most valuable point in the diagnosis of acute syphilitic nephritis is the result of specific therapy, particularly arsphenamin

A nephritis developing in a syphilitic who is undergoing mercurial treatment may be confusing, and a true syphilitic nephritis must be differentiated from a mercurial nephritis As a rule, the latter improves on the suspension of the mercury, which is not true of the former

The diagnosis of chronic syphilitic nephritis may be most difficult, but it seems to me that if all nephritics were examined for syphilis, both clinically and by laboratory methods, more cases of syphilitic nephritis would be found Of course other evidences of syphilis and positive laboratory tests would not be absolute proof that the nephritis was syphilitic, but the improvement of the condition under carefully administered specifics would be strong presumptive evidence that such is the case

Amyloid kidney due to syphilis can be diagnosed only by finding other evidences of a long-standing syphilis in a patient with a scanty urine, large quantity of albumin, anemia and edema of the face and legs A low blood pressure would also be significant

Gummas of the kidney may sometimes cause symptoms resembling renal calculus, but the two conditions should be differentiated by the presence or absence of other manifestations of syphilis and the use of the roentgen ray

Gummas of palpable size have been mistaken for malignant tumors However, the history and other evidences of syphilis, including a positive Wassermann test, in gummas should clear up the diagnosis Malignant tumors also usually occur later in life and produce more cachexia than do gummas

A renal tumor occurring in a patient with other evidences of syphilis would be an indication for specific therapy, and if improvement in the kidney conditions did not occur, a microscopic examination following nephrectomy would reveal the true nature of the tumor

PROGNOSIS

The prognosis of the early transient albuminuria of syphilis is good, as such conditions readily clear up under specific therapy

The outlook for acute syphilitic nephritis is much more grave, although in even markedly severe cases recovery occurs under careful treatment, and undoubtedly the prognosis is better in this type of case than is acute nephritis of other etiology

Chronic syphilitic nephritis possibly presents a more favorable outlook than does the acute variety, although in most instances a prognosis should be reserved until the effect of antisyphilitic therapy can be noted

Amyloid kidney is most resistant to treatment, and death with increasing cachexia is the usual outcome

Most cases of gummas of the kidney which have been recognized clinically have been cured by specific therapy

TREATMENT

In kidney syphilis the treatment should be twofold, that is, directed toward the syphilis and toward the kidney condition In the transient albuminuria occurring early in the course of syphilis, specifics and general treatment alone are indicated Specifics, however, must be administered with extreme caution in all nephritic conditions, the urine being examined for albumin and casts, and the phenolsulphonephthalein test being performed at frequent intervals

In acute syphilitic nephritis, rest in bed is imperative Diuretics, such as digitalis and potassium citrate, as well as cathartics, should be administered Hot packs to promote diaphoresis should be applied, especially in severe cases The diet should be nourishing, and consist largely of carbohydrates, while a strict milk diet is desirable in some cases Mercury should be withheld until the urine is free from albumin or nearly so, while arsphenamin should be administered in doses not to exceed from 0 1 to 0 2 gm at weekly intervals Slight exacerbations following the injection of arsphenamin should be disregarded and the dose repeated at the proper time

In chronic syphilitic nephritis, after the diagnosis has been established by the improvement of the condition under the administration of a small dose of arsphenamin, specifics should be pushed as intensively as possible, particularly the arsenicals, which are much better tolerated than the mercurials

The treatment of syphilitic amyloid kidney is symptomatic, although specifics may be administered, but with little hope of success

Large and increasing doses of potassium iodid as well as arsphenamin and mercury, are indicated in gummas of the kidney

ABSTRACT OF DISCUSSION

DR. WILLIAM H MERCUR, Pittsburgh A few years ago Sir Rose Bradford, discussing a case of chronic nephritis, stated that when an unusually large amount of albumin was present in the urine it might be due to syphilis Such patients do not usually show the customary clinical signs of being very ill

DR. J B MCELROY, Memphis Tenn I have seen several of the cases described by Dr Thompson, and there seems to be nothing specific so far as the syphilis is concerned They are the same cases which present the clinical syndrome which we recognize as degenerative nephropathies nephroses, symptoms which are characterized by the absence of high blood pressure, the occurrence of considerable edema, and a large quantity of albumin in the urine, with an absence of red blood cells

This syndrome is characteristic of degenerative nephropathies and occurs in other conditions as well as in syphilis We must drop the terms parenchymatous, interstitial, etc, which occur in connection with nephritis

---

Insecticides.—Naphthylamin crystals are used to kill body lice by sprinkling them down a man's neck between his shirt and skin Powdered sulphur, generally in the form of an ointment is used against the itch mite Mercurial ointment is used against the pubic louse by rubbing it in the affected part night and morning Various solutions, such as 1 500 solution of mercury bichlorid and 5 per cent phenol, are used to kill insects and liquor formaldehydi is used quite extensively in fly traps, although the gas formaldehyd is not an insecticide—*U S Nav M Bull* January, 1920

CURE OF PANCREATIC FISTULA BY THE ROENTGEN RAY

ROBERT M CULLER, A M, M D
Colonel Medical Corps U S Army
HOT SPRINGS, ARK

Two cases of pancreatic fistula under my observation have permanently closed after treatment by the roentgen ray They are reported for the information of those likely to encounter such conditions No attempt will be made to explain this action of radioactivity, which was used in these cases in the purest empiric manner If the application of the roentgen ray inhibits pancreatic secretion, the reason for the favorable outcome in both cases is plain

CASE 1.—A French soldier was wounded about Dec 15, 1916 by a machine gun bullet that passed through his body at the umbilicus I saw this man three days after the receipt of the injury at a *repartition station* The wound of entrance was ulcerated and excavated and all fatty tissues about the wound were necrosed A copious discharge looked like thin *mayonnaise dressing* indicating digestion of fatty tissues deeper than the abdominal wall The patient had been kept narcotized by opiates, and no food or water had been taken since he was wounded The surgical consultant on duty at the repartition station suggested roentgen-ray treatment, stating that he had heard of favorable influence in similar cases Exposure for five minutes to a very soft tube with the skin protected by sole leather resulted in complete cessation of discharge of pancreatic juice after five daily treatments with subsequent healthy granulation and complete healing of the wound

CASE 2.—A B a retired soldier, aged 66 admitted to the Army and Navy General Hospital with the diagnosis of gastric ulcer which was concurred in was found, on laparotomy, to have a carcinoma involving the lesser curvature of the stomach, pylorus, duodenum and head of the pancreas I performed a posterior gastro-enterostomy with the greatest difficulty because of friability and comparative immobility of the tissues The immediate postoperative course was stormy, and about the fourth day all catgut sutures in the operation wound parted, allowing the wound to gape widely Accompanying this unaccountable wound disaster was a profuse discharge which my assistant described by an exclusive remark that 'it was not blood pus or serum' Had it not been for the experience with Case 1, I should probably not have recognized this as a case of fat necrosis due to escape of pancreatic juice which was brought to the wound area and surface by a small rubber tissue drain The break into the pancreas no doubt occurred during the manipulations of this organ while the extent of the carcinomatous growth was being outlined or from handling during the performance of gastro-enterostomy Fat necrosis proceeded very rapidly, with destruction of all fatty tissues in and around the wound with a profuse discharge from the depths of the wound, indicating intra-abdominal fat necrosis

The roentgen ray was applied in this case in the same manner as in Case 1, a soft tube being used, backing up a 1½ inch spark gap, with the target 15 inches from the wound, and the skin protected by sole leather After the third daily roentgen-ray application of five minutes' duration the discharge of emulsified fat entirely ceased and healthy granulations began which quickly proceeded to complete healing The patient appears to be almost entirely well, although carrying with him a widespread gastro-intestinal carcinoma

The very pronounced beneficial changes following the use of the roentgen ray in both these cases suggests a trial of this expedient on all patients with pancreatic fistula, since it appears that the activity of the pancreas can be inhibited or at least put in abeyance by radioactivity

TYPES AND TREATMENT OF PELLAGRA *

STEWART R ROBERTS, S M, M D
Professor of Clinical Medicine, Emory University School of Medicine
ATLANTA, GA

Two cases of pellagra were reported in America in 1864,[1] and one case, of Italian origin, in 1883 Harris, of Georgia, reported a case in 1902, and since then it has been increasingly studied and reported until it is now found in probably every state in the Union, in the Hawaiian Islands, Mexico, Yucatan and Panama, indeed, from Canada to Chile[3] As clear cut and typical pellagra is found in Maine[4] and Massachusetts as in Georgia and Texas It is no longer a disease merely of the Southern states, and practitioners everywhere should be on their guard against its insinuating presence, for no disease can be diagnosed unless it is first suspected

DECREASE IN NUMBER OF CASES

It is a comment on public health work in America, as well as on the relative youth and vastness of our country, that accurate vital statistics are lacking All figures in their totals are, therefore, estimates It is probable that from 1902 to 1920 there have been 500,000 cases, with 50,000 deaths In 1916, the disease ranked fourth as a cause of death in Mississippi, with 840 deaths, third in Alabama, with 677 deaths, second in South Carolina, with 627 deaths, 607 in Tennessee, and 452 in Texas, or 3,700 deaths in six states[5] The epidemic has shown years of increase, as from 1902 to 1910, years of severity, from 1911 to 1916, and years of decline, from 1917 to the present There is a prevailing feeling among the profession in the South that the number of cases has decreased from 75 to 25 per cent, depending on the locality Even a greater percentage of decrease is reported by a few communities A few statements from official and private communications confirm this estimate of decrease

(*a*) Illinois Decreasing as well as becoming less virulent in character As a menace to the public health, the disease seems to have disappeared All institutions on a standard ration based on calories Diseases due to dietary insufficiencies will not recur—Dr George A Zeller

(*b*) Mississippi In 1915 15 831 cases and 1,535 deaths, in 1918, 8,340 cases and 746 deaths Decided decrease in number of cases and deaths from pellagra—Dr W S Leathers

(*c*) Florida Distinctly on decrease, of less violent type—Dr F Clifton Moor

(*d*) Virginia In 1914, there were 396 cases, and 249 in 1919 Becoming milder—Dr E G Williams

(*e*) Arkansas Becoming more mild as it is becoming understood that proper diet both prevents and cures most cases—Dr C W Emerson

(*f*) Alabama During eleven months of 1919, there were 660 cases Far fewer cases than five years ago—Dr J H Bowman

(*g*) North Carolina In 1914 831 deaths, in 1918 634, and to October, 1919, 323—Dr P M Register

(*h*) New York City In 1916 eleven cases, 1917 thirteen cases, 1918, nine cases, 1919, four cases—Dr L I Harris

(*i*) Boston In 1919, thirteen cases with fifteen deaths—Dr B W Carey

(*j*) South Carolina Averaging 550 deaths per year in 1916, 1917 and 1918 In November, 1919, during ten months, only 303 deaths Marked decrease both as to deaths and cases reported Disease decidedly more mild and chronic—Dr James A Hayne

(*k*) Louisiana Constant decrease in number of cases from 1915 to date—Dr M W Swords

(*l*) Kentucky One hundred and seven deaths in 1913, 148 in 1914, 144 in 1915, 120 in 1916, 198 in 1917, 148 in 1918 This is one Southern state in which the disease has not noticeably decreased but there have been relatively far fewer cases in Kentucky—Bulletin by Kentucky State Board

(*m*) Georgia Far fewer cases estimated 50 per cent decrease Vital statistics not available for comparison Disease more mild, rapidly lessening

It may therefore be said that, entering on the third decade of its activity in America, the disease is already on the wane as regards the number of cases This is a striking comment when compared with its far larger activity in Italy In the United States this is due to several factors (1) the early and widespread knowledge of the disease due to the conferences on pellagra in South Carolina by Babcock, the widespread discussion in medical societies and literature, and the activity of the various state boards of health, (2) the accent laid by Goldberger and his associates of the Public Health Service on an improper and unbalanced food as a cause, and on a proper and balanced food as a cure, the Thomson-McFadden Commission and the work of Lavinder, Siler and Garrison were aids in the numerous positive and negative facts deduced by their studies, (3) the magnitude of the evidence against any idea or proof of infection or insect transmission, (4) the ease with which good food is both grown and obtained in America, the general prosperity, high wages, and the good food enjoyed by the people, and (5) a wide awake medical profession, eager to learn, cooperating in their early recognition of the disease, and emphasizing proper diet and not indiscriminate drugs as the proper treatment

DECREASE IN SEVERITY OF THE DISEASE

Pellagra is decreasing not only in the number of cases but also in the severity of the types The history of the disease in Spain, France, Italy and America shows four well defined tendencies, after it has passed its crest of severity in each regional epidemic (1) a tendency to decrease in the number of cases, (2) a tendency to increasing chronicity, (3) a tendency to increasing mildness, and (4) a cumulative tendency to extinction In 1911 in northern Spain, the disease was practically extinct, and one could not find in northern Italy in the same year the acute, malignant and early fatal cases so common then and since in the Southern states

The disease is also decreasing in the severity of cases There is much to be said on this point By virtue of the decrease in number, the malignant cases have proportionately decreased It is probably true also that relatively the severe cases are more than proportionately less The bizarre dermatitis so common in the beginning is largely absent I looked for Casal's cravat in northern Italy in 1911 and found it, but such cases were often seen in Ger[illegible] are extremely rare in [illegible] Typ[illegible]

its dermatitis, fever, diarrhea, prostration and early death is rarely seen now We depended then probably too much on the dermatitis or the history of a dermatitis, to clinch a diagnosis, now we depend on lesser, more general and more constitutional symptoms

Not to have known the disease in its severity is to miss much in its mildness For example, there is a type occurring now among married women which for lack of a better name may be called pellagra in multipara A mother of several children, doing a great deal of hard work, with no vacation or servants, suffering from perineal laceration, constipation, visceroptosis, loss of appetite, and none too varied or appetizing diet —here is a pellagrous candidate Too often flurries of diarrhea, loss of subcutaneous fat, pinkish face and hands, roughened elbows and knees, raw tongue tip, weakness, low pressure and rising pulse, but no definite or typical eruption—this is pellagra sine pellagra (Cases 16 and 21)

Type changes and tendencies at present may be thus summed up

1 Acute typhoid pellagra is becoming comparatively rare

2 We encounter such cases of severe pellagra even less frequently than formerly, as Cases 2, 6 and 10 reported herewith

3 Cases without typical dermatitis, the so-called pellagra sine pellagra, are increasingly common and call for careful diagnostic scrutiny

4 Milder cases with early improvement and evidence of cure are increasingly frequent

The work of Goldberger probably marks the beginning of the final solution of the etiology of the disease We are dealing to all evidence with a nutritional disease, to be placed in the group with scurvy and beriberi Whether the food lack, or food "fault" as Goldberger terms it, shall be a vitamin deficiency, a protein amino-acid problem, a mineral ash disproportion, an unknown food fault beyond the ken of our present knowledge, or a combination of two or three of these dystrophias, future researches must determine Certainly we are forever away from the idea of an unknown infectious agent, and the other idea that the fault is a food, one food, namely, corn The great idea that Goldberger has forced and proved is that the disease can be caused by lack of a proper food balance, and can be cured by a proper food balance His researches may be thus summed up

1 Pellagra was produced in six of eleven white male convicts at the Mississippi State Penitentiary Farm in 1915 on a diet of white wheat flour, corn meal, hominy, grits, corn starch, white rice, sucrose, syrup, sweet potatoes, pork fat, cabbage, collards, turnips, turnip greens and coffee

2 At the insane asylum of Georgia, physicians, nurses and helpers who lived with pellagrins never developed the disease The former lived on a better diet, with more milk and meats, the inmates had little or no milk and meats When the latter had a better diet, the same as the attendants in general they ceased developing pellagra If put back on the former poorer diet, pellagra recurred

3 In the two orphanages at Jackson, Miss, 214 cases developed in 1914 on an unbalanced diet When milk, eggs and meats were added 172 completed the anniversary date of attack without a recurrence There was only one recurrence, and there were no new cases among the nonpellagrins of whom 168 were under observation for one year

4 A study[6] of seven cotton mill villages in South Carolina in 1916 showed that "nonpellagrous households enjoyed a more restricted supply of the foods of the animal protein group, i e, lean meat, milk, including butter, cheese and eggs Increasing supplies of milk or of fresh meat were found associated, one independently of the other, with a decreasing pellagra incidence"

It is noted that all Goldberger's studies have been among convicts, in insane asylums, orphanages, and the homes of cotton mill operatives The question naturally arises as to the explanation of pellagra in rural and urban homes of the well-to-do and the affluent, where food is abundant, varied, and pleasingly prepared, and to be had for the mere reaching and swallowing The twenty-five patients whose cases are reported here are all from private practice, and without exception are pellagrins who had an abundance of well balanced food on their tables, or obtainable, and yet who developed the disease

REPORT OF CASES

CASE 1—Mrs E A, aged 55, well-to do widow, who lived in a rural community and who was peculiar about food, for two years had felt a repulsion toward eggs, meats, chicken, peas and beans She lived alone with her daughter, and ate cereal, bacon, cabbage, spinach and crackers, and drank coffee Often she would eat practically nothing all day She had lost 24 pounds She had eaten no bread, only crackers She said that she just did not want to eat. She had had flurries of diarrhea from September, 1919, to February, 1920 When a frank outbreak of pellagra, with glossitis, discolored hands, and diarrhea, occurred, she was put to bed and given an antipellagra diet, following which there was rapid improvement

CASE 2—Mrs E H, aged 68, wife of a wealthy planter, who lived in a rural community with a luxurious home and food a book lover, who had collected thousands of books, and who had read all her life for years had had peculiar tastes for food She would skip meals, would eat a little fruit corn cakes or salad, had lost 25 pounds, had suffered with insomnia, and had begun taking whisky for sleep She refused wholesome food and for months had lived on knick-knacks coffee and whisky and had read in her room or in bed She developed acute pellagra in February, 1919, and died in two months

CASE 3—Mrs R P E, aged 31 lived in a rural community Her home had burned two years before, and her brother had been killed in France during the war She had worried a great deal was constipated and irregular and peculiar in her appetite, desiring chiefly pork greens cabbage, bread and coffee, and being averse to chicken eggs and milk, though she raised an abundance of vegetables and had her own chickens and cows She developed pellagra in July, 1919, was taken to the hospital, put on an antipellagrous diet, and rapidly improved

CASE 4—Mrs J P, aged 52, who lived in the city, had two years before, in December, 1917, passed through the menopause, during which she had worried a great deal, had suffered from insomnia and loss of appetite over domestic trouble Her family considered her a knick-knack eater She preferred cereal coffee, grits, toast and occasionally a rare steak but was averse to milk and eggs She had frank severe pellagra in September, 1919, which developed into pellagrous insanity

CASE 5—Mrs J K H, aged 53 living in an elegant home in the city, with no work and no exercise, had been enterop-

6 Goldberger Joseph Wheeler G A and Sydenstricker Edgar A Study of the Diet of Nonpellagrous and of Pellagrous Households J A M A 71 944 (Sept 21) 1918

totic and constipated, had a poor appetite, and had lost 20 pounds in weight This patient with mild chronic pellagra, showed marked and rapid improvement on an antipellagrous diet, and gained 20 pounds

CASE 6—Miss M K, aged 42, a housekeeper in the city, who did all her own work for a family of three, said that the preparation of food lessened her appetite She ate bread, syrup, pork, a few vegetables, drank coffee but no milk, and occasionally ate an egg She suffered the first attack in July, 1918, and a second and more severe attack following influenza, from which effect and loss of appetite she had not recovered Her brother said she was a "nibbler" at the table She was emaciated in appearance She developed manic-depressive insanity, and died in six weeks

CASE 7—Mrs B, a widow, aged 50, who was living with her niece in the city in March, 1920 prepared her own food, lived on vegetables, fruit, coffee, a small amount of meat or none Her niece said she had eaten little since her husband's illness, three years before She had had typical diarrhea and stomatitis, her weight had decreased from 170 to 140 pounds There was rapid improvement with rest and proper diet

CASE 8—Mrs J M B, who lived in the city, suffered the first attack in May, 1917 She weighed 92 pounds Hers was a case of typical severe pellagra Under proper food, she gained 30 pounds In November, 1919, she had another attack In January, 1920, she weighed 107, and after hospital rest and food, 127 pounds Her appetite had always been peculiar and variable "The kitchen turned her against eating" She would talk through a meal and eat little Coffee, bread, syrup, pork and greens comprised her diet Most marked improvement was on milk and eggs and all symptoms disappeared

CASE 9—Mrs W L F, aged 38, who lived in a luxurious home in a rural community, who had weighed 120 pounds and had lost 15 pounds, had very little appetite, ate little of meat and eggs, and was easily repelled by food Everything had to be "just so" before she would eat or before she would have a good appetite She gained 13 pounds and was a normal woman after proper food

CASE 10—Mrs F F B, a widow, aged 70, who lived in the city, and who weighed 100 pounds, had lost 30 pounds Her diet consisted of cereals, occasionally an egg coffee jam or marmalade, gravy, rice and grits For a year she had been a devotee of a no meat diet, and used proprietary foods, chiefly from a well known establishment She was notably varied and peculiar as to food The verdict of the family was that she "hardly ate anything," although she had an elegant home and table She had two attacks of pellagra, and died in October, 1919, one year after the beginning of the disease

CASE 11—Miss F N C, aged 43, who lived in the city and who had weighed 103 pounds, had lost 12 pounds She lived with a niece and did all the cooking, and often did without or ate prepared foods She ate meats and eggs very rarely, usually bread, grits, rice, cereals, spinach and cabbage Typical eruption and mild pellagra appeared, followed by rapid improvement on an antipellagrous diet

CASE 12—Mrs J H P, aged 59, who lived in a rural community amid splendid circumstances, had a son in the army She worried much and lost her appetite, had had some indigestion for nine months, and for the last four months had eaten very little Her diet consisted of bread toast, crackers buttermilk, one egg daily, soup, tomato rice, grits and a cereal preparation She was taken to a hospital, and under an antipellagrous diet improved

CASE 13—Mrs C H R, aged 32 who lived in a rural community and whose diet consisted of bread pork, grits, cereals, vegetables, such as cabbage and spinach, rare meat and eggs or milk and whose mind was involved, showed very little improvement on an antipellagrous diet

CASE 14—Mr W G M, aged 55 who lived in a rural community, complained of indigestion weakness and diarrhea He had lost 9 pounds in three months and was suffering from mild pellagra His diet for years had consisted of hog meat two eggs weekly beans corn, syrup spinach, bread and canned beans occasionally He ate meat once monthly, drank no sweet milk, had eaten no mutton in the last six years and drank buttermilk once daily He ate no cabbage This man was financially in good circumstances but economized in everything including diet On an antipellagrous diet, he gained 25 pounds

CASE 15—Miss F S, aged 30, who lived in a rural community, suffered from pellagra amounting to manic depressive insanity Her usual diet consisted of bread, syrup, fat meat, vegetables such as corn, spinach and peas, rare meat and eggs or milk She was a small eater Since suffering from pellagrous symptoms, she had eaten very little food and had been difficult to feed

CASE 16—Mrs A F W, who lived in a rural community, developed pellagra during convalescence from a fourth miscarriage in 1915 She was very nervous, and had taken drugs and morphin to induce sleep She was a most peculiar and irregular eater, would skip meals, and only bite at meals Her diet consisted of breads syrup marmalade and jams She felt a repulsion toward meats milk, eggs and really wholesome vegetables On an antipellagrous diet, this nervous, pellagrous woman of 107 pounds gained 40 pounds, and in 1920 is looking well and runs a large house Her husband, who is a physician, says that when she hesitates concerning her food, the nervous symptoms appear

CASE 17—Mr J C N, aged 62 who lived in a rural community, had suffered from chronic pellagra, which began in 1905 at the aged of 52 He was a rich farmer who worked hard and ate little His diet consisted of breads fat meat, ham, syrup, buttermilk vegetables such as peas, cabbage, turnip greens and potatoes, and little meat, eggs or milk. The disease had made inroads into his strength and weight The symptoms remained in abeyance and he lived until 1918, when he died of pneumonia at 65 He had been under treatment for the last six years, he had taken two eggs daily, from two to four glasses of milk, peas beans, meats and oatmeal

CASE 18—Mrs M L R, aged 42 an elegant woman from a splendid home in the city, who had undergone operations in 1896 and a posterior gastro-enterostomy in 1909, and a cholocystectomy in 1916 Adhesions and contractions of the pylorus with dilatation of the duodenum below had followed She had suffered from constant indigestion, nausea and vomiting, had been repelled by food and had taken morphin for relief of pain Pellagra developed during one of her prolonged vomiting attacks, followed by an attack in December, 1919 She died in February 1920

CASE 19—Mrs J F H, aged 66 who lived in the city in the best of homes and who had the best of food, had always been in her husband's opinion a very light eater She ate batter cakes and eggs or drank a glass of milk for breakfast, ate sparingly of vegetables for dinner, and for supper ate clabber and toast or a biscuit She seldom ate meat Since the war had begun she had had a great deal of trouble with cooks She said preparing food gave her 'cookitis" i e, took away her appetite She had eaten very little the last few months Acute pellagra developed She was seen Oct 22, 1919, and died in four weeks

CASE 20—Mrs H H C, aged 50 a city dweller, who was very nervous and a very light uncertain eater, who picked at the food rather than ate it developed chronic pellagra with no appetite and with mental symptoms She rarely ate meat, eggs or drank milk On an antipellagra diet and rest she gained 25 pounds At first she refused to eat asserting that her stomach would not hold much food, apparently a psychic inhibition to food Never hungry" was a frequent statement

CASE 21—Mrs W M F aged 41, who lived in a rural community, had fairly good nutrition Chronic mild pellagra developed, manifested chiefly by rather continuous dermatitis and nervous symptoms The appetite was fair but she ate no meats rarely an egg, and drank milk She never used sugar, breads, syrup, vegetables and fruits There was improvement under an antipellagrous diet but it was almost impossible to get the patient to eat regularly and persistently Any worry, real or imaginary would destroy her appetite

CASE 22—Mr J K O, aged 44, who lived in a rural community where food was plentiful, ate rather a monotonous diet, and for four months had eaten very little, he was not a large eater at any time He lived on bread, coffee, syrup, vegetables, hog meat and buttermilk, and had lost 14 pounds in weight There was marked improvement under an antipellagrous diet He now weighs 6 pounds more than ever before, and is in active charge of a large farm

CASE 23—Miss M O, aged 30, a city dweller, was 9 pounds below her normal weight She had mild chronic pellagra She had felt a peculiar repulsion toward food since an attack of typhoid fever when she was 23 years old She refused ordinary vegetables, bacon and ham, milk and cheese These things caused vomiting, a purely psychic effect Her sister said she was "a skimpy eater" Her brothers asserted she was weak because "she did not eat enough for a baby" She ate eggs, a little bread fruit and syrup and drank buttermilk. Improvement followed an antipellagrous diet and rest

CASE 24—Mr J W C, aged 74, a city dweller, had had pellagra for five years in the form of an annual spring attack, with increasing weakness He was a rich man, absorbed in business, who worked from twelve to eighteen hours a day He ate canned goods around his stores He was a man who ate lightly and irregularly, drank some whisky daily, and asserted that he was never hungry He died after five years

CASE 25—Mrs C H M, aged 36, a city dweller with severe pellagra, was emaciated and prostrated Her usual weight had been 120 pounds It was 96 when seen March, 1916 From her childhood she had been very peculiar at the table and "finicky" about her food She would not eat meat of any kind not even chicken except occasionally a ham sandwich She never ate eggs, drank milk, or ate wholesome vegetables She was a dietary devotee of syrup, salads, breads, cakes, desserts and butter She believed she had had sore mouth occasionally for years Under antipellagrous diet, she gained 32 pounds, reaching 128 A light attack occurred in the spring of 1919 Her weight now is 150 pounds or 22 pounds more than ever before in her life She eats regularly and freely of all foods she had refused for a lifetime

COMMENT

These cases speak for themselves Not one of the patients ate a well rounded, balanced diet of meat, milk, eggs or wholesome vegetables In Cases 1, 3, 6, 7, 8, 10, 11, 12, 13, 14, 15, 17, 21 and 22 the patients ate practically the same diet Goldberger used in producing pellagra in the Mississippi convicts, or that the orphanages and asylums previously used There seems, therefore, to be a pellagrous diet In Cases 2, 4, 5, 9, 19, 20, 21, 23 and 25 the patients ate less than this diet, were "skimpy," knick-knack, psychic eaters Case 18 is remarkable in that this patient was emaciated from an average of ten attacks of nausea and vomiting in twenty-four hours It was impossible to nourish her, and pellagra developed under our very eyes in the midst of an unsuccessful attempt to feed her Rolph reports a case of pellagra developing in cancer of the stomach In both cases it was impossible to nourish the patient

Case 25 is worthy of note This woman had all that money could give, was reared in the same environment as her healthy sister and athletic brother, and differed from them in her peculiar and unexplainable repulsion toward the ordinary articles of wholesome diet She sank to 96 pounds, now she weighs 150, drives her own car, and eats all she formerly refused Why she grew with such strange food repulsions, it is difficult to understand

The outstanding facts with regard to these twenty-five pellagrins may be thus summarized

1 Only two of these patients were naturally plump to abnormal adiposity, Cases 2 and 8 The leanness of most of the others was striking Fat people rarely become pellagrous

2 Pellagra develops as easily among the affluent and the urban as among the poor and rural It is the food that is eaten that counts Thirteen were city dwellers and twelve lived in rural communities

3 All of them had the best food With relation to food they may be regarded as of two classes (*a*) one class ate an unbalanced diet, (*b*) the other, not only an unbalanced, but a "skimpy," starvation diet These patients were undernourished

4 As soon as put on a diet which they formerly refused for psychic or imaginary reasons, they ate it continuously, improved and led active lives (Cases 1, 5, 14, 17 and 25)

5 There is apparently among the better classes a small proportion who have a natural or acquired antipathy to a well rounded, balanced diet Is there a dietary hysteria? Some persons pride themselves on never getting hungry Grief, monotony, disease, domestic worries, the preparation of food, constipation are agents in depriving women more than men of their appetites In this series there were only four men and twenty-one women

TREATMENT

1 *Diet*—Here food is of consuming importance, but it is of no importance unless it is consumed Therefore, the dietary cooperation of the patient must be obtained The disease should be named and explained to the patient, and with it the necessity for eating Especial accent should be laid on directions for eating directions and not appetite are to be followed This is one reason why Goldberger has had such good results with his penitentiary, asylum and orphanage cases, these patients have been under control, under institutional routine, and the balanced food has been taken to them, and persistently taken to them month after month Some such remarks as these should be made by the physician to his patient "There are three things about your diet First, we will look after what is brought you to eat Second, you eat what is brought you whether it appeals to your appetite or not If you swallow it, it will go down Nature will do the rest Third, we shall all rejoice at the results" During the attack, or for the first few days, feeding mouthful by mouthful may be necessary Great harm is often done the patient by neglecting to feed during the extreme weakness of the severity of the disease, and just waiting until the patient "feels like" eating Here, less food means more pellagra, more food, less pellagra

2 *Rest*—Pellagrins during the attack or when weak or below their normal weight should be put to bed like a "rest cure" patient, and kept there on a high calory diet until their weight is 10 per cent above the normal if this can be done Food, flat and fat are triple alliterative therapeutics for pellagrins

3 *Liquid Diet*—Chiefly for an acute attack, with "sore mouth," esophagitis, rectitis and difficulty in chewing or swallowing, a liquid diet should be employed To feed all the articles included in the appended list in twenty-four hours gives an intake above 3,000 calories It may be unwise or impossible to feed so much in a given case However, 2,000 calories or above is a good rule, with three meals a day, and milk and eggs between and at night Articles

from the general diet should be added as soon as the condition permits

4 *General Diet*—In general a fresh, lean meat, two eggs, two glasses of milk either sweet or buttermilk, and butter should be eaten daily, along with vegetables and breads to make a well balanced diet The following is a brief outline from which a choice may be made·

Breakfast Fresh fruit or oatmeal, with milk and butter One or two eggs or a meat Grits, bread, gravy Milk or coffee or tea

Dinner A meat of any kind, including roast, steak, mutton, chicken fish, pork game Bread of any kind Vegetables including especially peas and beans, fresh vegetables of 3, 6 10 and 20 per cent carbohydrate content These can vary on different days, potatoes, rice, and 3 per cent alternating with peas beans butterbeans, corn macaroni onions, beets, etc Milk butter, desserts jellies salads

Supper Bread, butter, milk eggs a meat fruit, clabber, cheese, gravy, grits, syrup and jam or preserves occasionally

There are two pocket diet slips that are invaluable for the practitioner who treats pellagra or the patient who has pellagra "Food Values in Household Measures," obtained from Franklin W White, Boston, or Joslin's diet slip, obtained from Thomas Groom & Co of Boston Each is of great service in feeding, and the patient is easily interested The aim should be to feed from 30 to 35 calories to the kilogram of body weight

DIET LIST FOR USE DURING AN ATTACK OF PELLAGRA

Food	Ounces	Measure	Proteins per Cent	Fat per Cent	Carbohydrate per Cent	Calories
Eggs (6)			36	36		460
Milk	48	6 glasses	48	48	72	912
Cream	16	2 glasses	16	96	16	990
Sugar	½	Heaping tablespoonful			8	33
Cocoa	1	Tablespoonful	6	9	11	150
Milk toast	2	2 slices	6		36	180
Oat meal cream wheat	3	3 heaping tablespoonfuls	6	2	20	170
Apple sauce	1½	Heaping table spoonful		1	16	72
Butter	1	3 balls or patties		25		225
Totals			117	217	179	3 142

5 *Psychic Factors*—Regular morning toilets, baths, psychic peace, accent on clean teeth and mouth, the avoidance of exhaustion and encouragement are all essential aids

6 *Drugs*—These are of rather minor importance In the mild cases, particularly in children or in those who eat well, they are usually unnecessary Pellagra is not cured by drugs The time honored arsenic and iron seem of little value It takes food to make blood and flesh and strength Drugs are nearly useless in the diarrhea of pellagra It is probably an effort of nature to rid the system of something Bed, rest and food are the help for diarrhea I have known a weak woman with ten liquid stools a night to drop in forty-eight hours to one or two after bed and feeding

(*a*) The tincture of nux vomica, in doses of from 15 to 25 drops after meals, is of value as an appetizer and stimulant

(*b*) Dilute hydrochloric acid in doses of from 20 to 30 drops is often of value with low gastric acidity or persistent diarrhea, which is often an accompaniment of the diarrhea

(*c*) An endocrine mixed gland tablet, thymus, thyroid, suprarenal and pituitary, seems to help in certain cases with marked somasthenia, hypopressure and muscular weakness

(*d*) Zinc oxid ointment or cold cream aids in smoothing and softening the rough, scaling or inflamed or fissured skin

(*e*) Sedatives and opiates are rarely indicated Acetylsalicylic acid or a capsule containing 1 grain of caffein, 2 grains of phenacetin, and 3 of acetylsalicylic acid aids in relieving the multiple little pains and complaints with which the nervous pellagrin is afflicted

7 *Hospital Treatment*—Pellagrins during an attack do better in a hospital or institution than at home A change of table aids the appetite Eating at regular hours is essential The diet list should be written Surgery should be avoided unless a real surgical emergency arises

CONCLUSIONS

1 Pellagra has been reported from Canada to Chile, and the profession in the Western Hemisphere should be on the lookout for it

2 It has probably caused 500,000 cases and 50,000 deaths in the United States in the last twenty years

3 The number of cases appears to be decreasing, and the types tend to be more mild and chronic

4 Pellagra sine pellagra is of importance because it is more difficult to diagnose than when the eruption is present

5 Goldberger has shown that the disease can be caused by an improperly balanced diet and cured by a balanced diet, with accent on lean meats, eggs, butter, milk and vegetables containing proteins

6 Cases of pellagra occur in families that have abundant food of great variety There are certain people who, although they have such a diet, do not eat it and develop the disease

7 In treatment, diet is of consuming importance, and two diet lists have been given, one for the attack and one general diet The cooperation of the patient must be obtained Drugs are of minor importance, but in certain cases are valuable

20 Ponce de Leon Avenue

ABSTRACT OF DISCUSSION

DR MARVIN L GRAVES Galveston Texas Dr Roberts is too enthusiastic in attaching *quod erat demonstrandum* to the demonstration made by Dr Goldberger The fact that Dr Goldberger produced certain forms of dermatitis of a more or less atypical form in patients submitting to experiments on a limited protein and a high carbohydrate diet does not conclusively establish the fact that this deficiency in diet was the cause of pellagra Those who have attempted to produce the disease by contact with flies that have had access to latrines where pellagrous patients have visited and those who have made other efforts to determine some infectious agent have so far failed, but it appears to me that in the consideration of the subject today one must give the Scotch verdict of not proven' so far as the etiology of pellagra is concerned In regard to the diminution of the activity of the disease I am quite in accord with Dr Roberts I do not know that the types of the disease have changed so much as that there has been a gradual and progressive diminution in the intensity of the disease. A decade or more ago it was quite possible to see in Texas many cases of pellagra presenting the tripod of diagnostic symptoms dermatitis, diarrhea and the many nervous phenomena principally insomnia, with depression The typical cases have been steadily decreasing in number In C we

see two types of cases one abdominal or gastric, presenting a syndrome something like that of gastric ulcer In three cases I have had operations performed for gastric ulcer In two, large gastric ulcers were found Within forty eight hours following the performance of the operation the patient developed an acute active pellagra, with dermatitis, and with marked gastro-intestinal symptoms, so that the diagnosis was plain The second type of case presents a nervous syndrome, consisting now largely of insomnia, of depression with anxiety neurosis, or anxiety psychosis, in which the patient has, first of all, indefinite apprehension and finally a fully developed anxiety, with marked depression and insomnia, frequently going on to a toxic delirium before the termination of the cases

DR ALLEN EUSTIS, New Orleans I have been particularly interested in the diet of pellagra patients on account of the relation of a low protein intake to the incidence of the disease Even before Goldberger called our attention to this fact, I had a patient develop symmetrical dermatitis of the dorsum of both hands and forearms, which was pronounced typical of pellagra by Dr Menage I had placed this patient on a very low protein diet in the treatment of her asthma Receiving relief from the latter condition, she had adhered to a diet of cereals and fruits, as fresh green vegetables were unobtainable at that time of the year I did not hear from her for two and one-half months, when she presented herself at my office with the typical skin lesions of pellagra, but without any of the usual gastro-intestinal symptoms She was given a prescription for 1 grain pills of sodium cacodylate and instructed to eat more liberally of eggs, milk and chicken, as her physical condition denoted decided undernutrition She wrote me in one week that she had only just received the pills as they were not to be had in her home town, and asking if she should take them, as the eruption on her hands was entirely well This seemed so incredible that I wired her to come in to see me at once and I was able to verify the fact that a typical pellagrous eruption had disappeared in one week, without any medication, but only after increasing the protein intake by the addition of eggs and milk to the diet Since then I have had two other cases one a case of visceroptosis and the other a case of arterial hypertension and nephritis This patient developed pellagrous skin lesions, as well as a severe stomatitis, after following a low protein diet without green vegetables for a period of two months Both these patients promptly recovered after adding milk and eggs to their diet None of these patients have had any recurrence Are we justified in stating that these were cases of pellagra? In the absence of the putrefactive diarrhea, suggestive of some infection of the gastro-intestinal canal, I do not consider that they can be termed pellagra" We must decide, first what constitutes pellagra and whether or not the cutaneous lesions seen so often in the disease are evidence of malnutrition and absence of vitamins in the diet, of a person rendered particularly susceptible to a particular form of gastro-intestinal infection from his lowered nutrition On the other hand no one can dispute the fact that Goldberger has proved that from an epidemiologic standpoint the diet is the most essential factor in the control of the disease and its incidence in any given locality Certainly, the disease has practically disappeared from this state since he first advocated feeding a community a full diet and since the physician even in the most remote rural settlements became acquainted with his work That it is not merely a question of protein deficiency is suggested by the fact that I have been advocating the low protein diet in various diseases for the past seventeen years and have had only three patients develop any symptoms of pellagra and each of these withheld green vegetables from the diet

DR. HENRY S PLUMMER Rochester, Minn In the last two years I have seen three cases diagnosed as pellagra that came from the South They all had basal rates from twenty to twenty-four points below normal We have a group of hysterical dysphagias without the history of any other stigmas The patients simply cannot swallow I have seen them strain all their food through a cheese cloth, with no meat in it, for thirteen or fourteen or fifteen years They develop an enlarged spleen I have seen the preliminary diagnosis of cancer made Slip a filiform bougie into the throat, tell the patient to swallow, and that he will be able to swallow the next morning, and I have never seen one that did not They recover fully on a mixed diet The enlarged spleen is definite They have a dry skin, but I have never seen in that group a definite dermatitis

DR GEORGE DOCK, St Louis I agree with Dr Eustis in the fact that there are certain conditions in the skin of the extremities, either trophic disturbances or symmetrical dermatitis that are very difficult to distinguish from pellagra, and sometimes it is impossible to do so, but which are not cases of pellagra In 1909 I visited the Pellagrarium of Rovereto in the Austrian Tyrol, a very large institution, where they had a great many pellagrins To my surprise, none of them had skin changes, and the physicians told me that they never had They said that if they waited for the skin lesions to make a diagnosis of pellagra, they never would make it They based their diagnoses on the condition of the mucous membrane of the mouth, the appearance of the tongue the mental condition, and the general cachectic condition of the patient They cured them all by giving mixed diet One should remember that pellagra is not merely an eruptive skin disease that there are many kinds of dermatitis, affecting the hands, some in deficiency diseases and some in other conditions

DR. W G SHEDDAN, Columbia, Tenn Pellagra is not so modern a disease in this country as we have been taught I recall seeing cases thirty or thirty-five years ago which I am sure were pellagra, cases which were diagnosed as something else then I think many cases occurred in the hands of other men and were overlooked or called something else At least one half of the cases I have seen have shown no dermatitis The initial symptoms are the nervous and mental symptoms In many cases the psychic symptoms are most evident and predominate, I believe that the original pathology is in the central nervous system, and that the gastro-intestinal disturbances come next Many of these patients either die or get well before they ever have dermal symptoms

DR STEWART R ROBERTS, Atlanta Ga The statement of Dr Plummer that the basal metabolic rate is low, is to be expected If one sees great numbers of these pellagrins, they are thin, with low blood pressure, and weak, poor appetite and eat little food I agree with Dr Sheddan in regard to the fact that at the present time, if we wait to base a clinical diagnosis of pellagra on the dermatitis or on the skin condition, we would miss most of the cases of pellagra Before Goldberger came we were more or less helpless before pellagra, particularly the more severe cases We can now promise these patients some definite improvement on the basis of a mixed diet We try to put them on a caloric intake above 3 000 Some of them can go up to 4,000, and it is true, whatever the idea of etiology or diagnosis may be concerning the disease, that with these unfortunate patients, the less food the more pellagra, and the more food the less pellagra and the greater improvement

---

Narcotic Dispensaries—Death does not result from sudden deprivation of the drug in the case of a healthy addict—an addict without any therapeutic reason for addiction—a case of cancer painful tic etc, naturally not being included in our consideration as all of these cases are under either suitable institutional or private physicians' care The suffering caused by the sudden deprivation is not as severe as it may appear on the surface and it is of short duration If hospital facilities can be provided, there is no excuse for a public or private narcotic dispensary If they cannot, it might be desirable to make arrangements for personal administration of drugs to addicts as a temporary measure of relief A dispensary where the drugs are dispensed to the addicts for self-administration is so harmful in its effects that it cannot be recommended under any circumstances—S D Hubbard *Pub Health Rep* March 26, 1920

A STUDY OF MALNUTRITION OF SCHOOLCHILDREN *

MAUD A BROWN
KANSAS CITY, MO

This piece of experimental health work was carried on in the grade schools of Kansas City, Mo, in the spring of 1919 Following the influenza vacation, the children of fifty-five grade schools were weighed and measured by the classroom-weight-chart method of the Child Health Organization The percentage of underweight, when computed, indicated that the general estimates as to the prevalence of malnutrition among schoolchildren in the country over were applicable, without exaggeration, to the children of Kansas City

It was determined to take the school that showed the highest percentage of children who were more than 10 per cent under weight by the standard table of Dr Wood, and see what would be the effect of an intensive health service for these so-called "malnourished" children This school was the Lowell School, which showed 41 per cent of its children more than 10 per cent underweight

THE PLAN

Kansas City is fortunate in having an antituberculosis society which furnishes ideal health service for 200 anemic schoolchildren This service

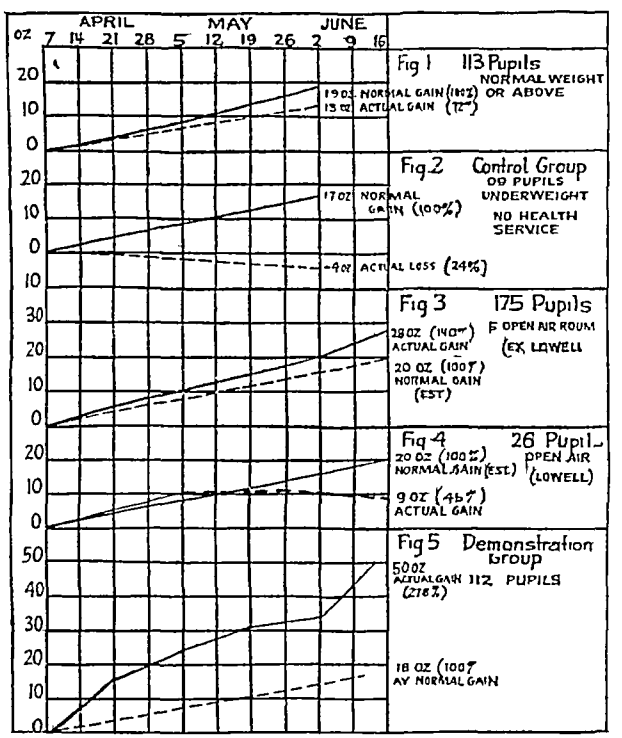

Chart 1—Composite curve

includes medical and dental attention, nurse's service, open-window schoolroom, shower baths, and midmorning and midafternoon lunch, followed by naps The improvement of the fortunate few is so marked as to emphasize the responsibility of the community toward the rest of its malnourished schoolchildren Manifestly the expense of extending this service to all in need of it would be prohibitive for this agency and there was no other source for the supply of the necessary personnel and equipment The antituberculosis society determined to establish an ideal health service for a limited number of pupils, in the hope that the comparative study of results would determine which elements gave greatest return in health for the money expended The health study was conducted by the supervisor of hygiene of the department of physical education of the Kansas City public schools

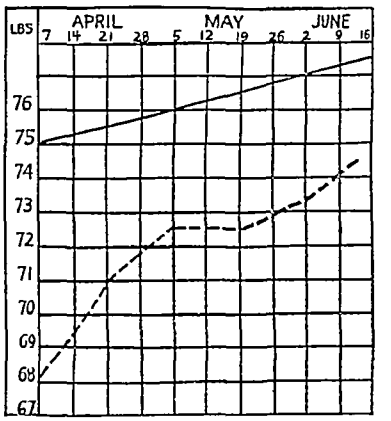

Chart 2—Curve of a boy aged 11 height 55¾ inches normal rate of growth 12 ounces a month normal weight 75 pounds total expected gain 28½ ounces actual gain 100 ounces This was a plain case of undernourishment another two weeks would have put him over the top

Lowell School is located at the corner of Twenty-Seventh and Madison streets, in a residence district The families are those of wage earners ranging from $50 to $200 a month in income The district is almost entirely American

The building is one of the oldest in the city It is brick and frame with cracked and splintered floors and torn wall paper, so old that the best of janitor service is necessary to supply the minimum standards of sanitation The playground is very small, and the rainy day play space in the basement is so small as to be useless

THE METHOD

(*a*) All pupils were weighed and measured, those under weight were examined by the physician for the open air room

(*b*) Blanks for permission of parent for feeding, dental attention and operations on tonsils or adenoids were sent home by the pupils

(*c*) All who returned the permits for school feeding were enrolled in the demonstration group

(*d*) This happened to divide the underweight pupils into two almost equal groups, 112 who were given school feeding and 109, identical in respect to physical condition as nearly as could be determined, who were considered the "control group"

(*e*) The demonstration group were weighed every two weeks, in muslin weighing slips only The control group were weighed once a month in indoor clothing except coats and shoes

(*f*) A trained nurse was employed for this health study who gave her entire time to this demonstration group, visiting every home, carrying the recommendation of the physician and soliciting the cooperation of the mother The home dietary was investigated, and such instructions given the mother as conditions seemed to warrant

(*g*) Midmorning and midafternoon nourishment were given the demonstration group The food was planned to supplement the home dietary, and to supply about half (from 1,000 to 1,200 calories) of the neces-

* Owing to lack of space certain charts and illustrations have been omitted These will be included in the reprints a copy of which may be obtained on application to the author

sary day's ration The principle of "protective feeding," as developed by McCollum of Johns Hopkins University, was rigidly followed Each child received from 1 to 2 pints of milk with cereal and fruit every day The rest of the 1,000 to 1,200 calories was variously supplied in soups, vegetables and sandwiches Cocoa was frequently served, with occasional treats of cookies and milk chocolate The nurse induced the mothers to give the children greens at home The cost of the food averaged 6⅓ cents a meal

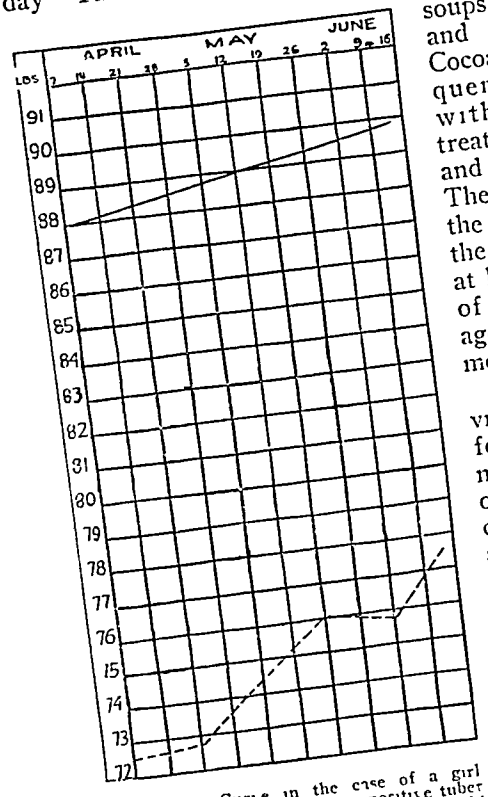

Chart 3—Curve in the case of a girl aged 13 height 58½ inches positive tuberculin reaction d Espines sign fifth dorsal vertebra rise of temperature in afternoon tonsils badly diseased Solid line normal gain 28½ ounces broken line actual gain 80 ounces a gratifying gain in spite of heavy handicap

(*h*) Clinical service was secured for children who needed treatments or operations, especially for tonsils and adenoids

(*i*) A dental chair was set up in the school, and service was supplied free to every child in the group found to be in need of it

(*j*) Instruction in "health habits" was given all pupils in the school, the Junior Red Cross health crusade being faithfully carried on here as in the other schools of the city A first prize of a volley ball and a second prize of an indoor baseball and bat were offered to the rooms which lowered their average of underweight by the greatest percentage

(*k*) After each weighing, the nurse revisited the mothers of the pupils who had lost weight, and, after the first month, each pupil who lost weight was given an extra cup (½ pint) of milk During the last month each child who had lost weight was given, in addition to the half pint of milk, 100 calories of dates, raisins or chocolate some of the group by this time receiving up to 1,800 calories a day

(*l*) The pupils represented all grades from the kindergarten to the sixth grade The kindergarten pupils had but one feeding a day, because of single sessions, and the upper grade (seventh) did not supply any pupils to the demonstration group

(*m*) *No child was dropped from this group for any reason whatsoever*

(*n*) A curve was kept for each pupil The nurse and the conductor of the experiment kept individual records in order to check possible inaccuracies

The physical condition of the children, as revealed by examination of the physician, the dentist and the corrective specialist, is given in Table 1

The social status of the children as discovered by the nurse in visiting the homes is given in Table 2

Fourteen children failed to make normal gain for the period

Of these, four were in the hospital from four to six weeks for tonsil and adenoid operations They gained after their return 100, 200, 200 and 340 per cent, respectively, as compared with the normal rate of gain for the same period

Three were out with contagious diseases (measles, mumps, diphtheria) for several weeks each The two who returned (after mumps and diphtheria) made 200 and 400 per cent, respectively, for the short time they were in class

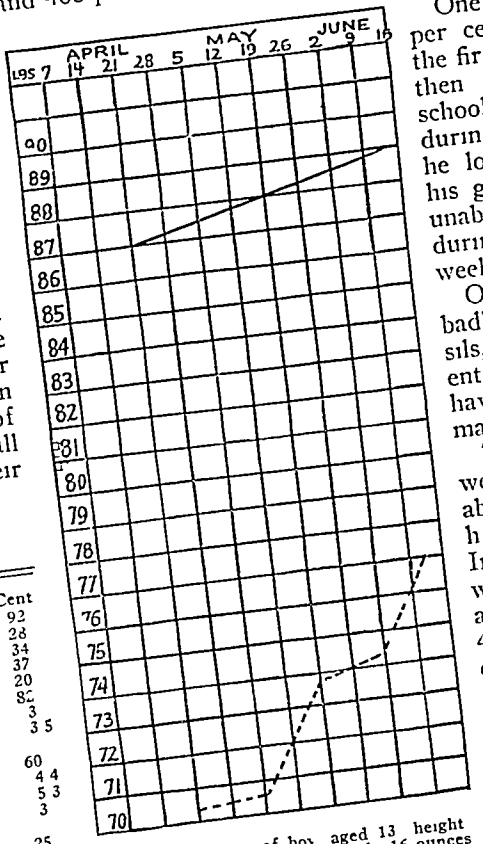

Chart 4—Curve of boy aged 13 height 58 inches normal rate of growth 16 ounces a month normal weight 87 pounds total expected gain 26 ounces actual gain 108 ounces This is an instance illustrating what perfect cooperation will do The boy literally took on a new lease of life His changed appearance was startling

One made 300 per cent gain for the first five weeks, then was out of school two weeks during which time he lost more than his gain He was unable to catch up during the last two weeks

One girl had badly diseased tonsils, which her parents refused to have removed She made little gain

Two failures were directly traceable to adverse home conditions In one case these were circumvented, and the child made 400 per cent gain over normal rate in the last month In the other case the difficulty was insurmountable

The twelfth case was lost because of the natural perversity of the child and her mother Both were untruthful and persistently broke all known health rules This was the only case in which we were sorely tempted to break our rule of dropping no one from the group for any reason The family moved to Chic go at the end of four

weeks, the child having made 50 per cent gain for the month

The thirteenth case was difficult to account for The only adequate reason for failure to gain seemed to be the fact that she had too little rest and play, as she attended a religious school after public school hours

The fourteenth boy absolutely refused to gain The more he ate, the thinner and stronger he became He played on the baseball team and was apparently in tip-top health We decided that he was one of the "naturally thin" children we hear about

THE RESULTS

Chart 1, a composite curve containing five subdivisions, shows the results Figure 1 shows that the 113 pupils of normal weight who were present at both weighings made an average of 13 ounces gain each, or 72 per cent of the normal rate of gain These pupils received none of the school service Figure 2 shows that the 109 underweight pupils of the control group not only made no gain, but actually lost an average of 4 ounces each These pupils received no school health service Figure 3 shows that the 175 pupils of the other five open-air rooms of the city gained an average of 28 ounces, or 40 per cent above the normal rate of gain Figure 4 showed that the twenty-eight pupils of the open-air room who received the same food and physician's services and, in addition, shower baths and rest periods (sleep) after each feeding, but whose nurse was employed for part time only and had little time, consequently, for home visiting, gained only 45 per cent (the normal gain being 100) Figure 5 shows that the 112 pupils of the demonstration group gained 278 per cent, or 50 ounces, each, (the normal gain, 100 per cent for the group, being 18 ounces each) This, added to the 24 per cent loss of the control group, gives an advantage of 302 per cent over the control group

The curve of the "feeders" shows three striking features

1 The initial rise Nearly all the "feeders," no matter what the condition as to teeth, tonsils, adenoids or home care, made an immediate gain, this being before the nurse had had time to reach the homes and before defects of any sort had been corrected No reasonable doubt can exist that this initial gain was the response of the underfed tissues to food

2 The slump in May This was a most discouraging time for all concerned The weighing, May 15, showed fifteen of the group to have lost weight The amount of milk given to each of these was doubled, and 100 calories of chocolate, dates or raisins added to the meals May 19, these had gained, but still more of the pupils had lost By June 2, half the group were receiving the extra food

3 The rise in June During the ten days in June the curve starts upward with the "almost perpendicular" rise which Dr Hendee Smith says may be expected from children after obstructions to proper assimilation have been removed

Several elements enter into the explanation of the May loss and the June gain

(*a*) The weather May had nine sunny days It was a drizzly, cold month, following a few warm sunny April days, whose deceptive promise caused the children to emerge from their winter underwear as from cocoons The beginning of the barefoot season means no more shoes to be bought until next fall's cold weather makes it imperative Many children wear no underwear worthy the name during the summer Tonsils reddened, colds sniffled Small, undernourished bodies had no resistance with which to combat the chill The first warm days of June had much to do, it seems reasonable to suppose, with the hopeful tilt shown by the curve

TABLE 3—WEIGHT OF LOWELL SCHOOL PUPILS ALL ROOMS EXCEPT OPEN AIR ROOM

84	0 5
72	6 10
74	11 15
46	16-20
36	21 25
4	26 30

(*b*) The nurse, by superhuman effort, revisited the home of every "loser," and by the sheer force of personality, to which more than to any other element the success of the whole undertaking was due, secured a revival of effort on the part of the mothers Many busy, overworked mothers, supposing no news to be good news, had relaxed their efforts

(*c*) The extra food In some cases the additional milk and the chocolate, dates or raisins added daily

probably furnished just the help needed to start the curves upward

(*d*) Those children who had had defects corrected were just ready to show the benefit of the health service It is unfortunate that the earlier closing of school made it impossible to carry the feeding on till the end of June as originally planned

STUDY AND INTERPRETATION OF RESULTS

A careful study of the results forces the conclusion that the two factors chiefly responsible for the interesting showing are the work of the nurse in securing home cooperation, and the selection of food with reference to supplying the dietary deficiencies of the home on the "protective feeding" plan

One of the most interesting observations was that these children cheerfully stowed away from 1,000 to 1 800 calories in addition to their customary three meals The mothers reported that they were eating more at home also It is probable that the amount of food needed by growing children has been underestimated [1]

No correlation has been found between the rate of growth of these children and any of the social conditions

The time was too short to show the favorable results of the other elements of the health service Doubtless, a few weeks longer would show a decided advantage in favor of those pupils who had defects of teeth and tonsils corrected and adenoids removed

Two facts stand out with paramount significance

1 These children, in spite of adverse conditions and handicaps unremoved, were so desperately in need of food that they made a gain of 278 per cent (normal gain, 100 per cent) or 302 per cent gain over the control group

2 This school, which ranked lowest (fifty-fifth) in the spring, ranked third in September, the difference, beyond reasonable doubt, brought about by nine and one-half weeks of intensive health service

---

THERAPEUTIC AGENTS IN CHRONIC NERVOUS DISEASES *

W A JONES, M D
MINNEAPOLIS

Chronic nervous diseases include the various types of mental and nervous diseases, defects, and associated illnesses that are interrelated with the somatic system As approximately 50 per cent of all diseases, of whatever nature are primarily or fundamentally due to mental influence in its broadest sense, we have a basis for methods of treatment The more definitely limited disorders of the nervous system not controlled by mental states are comparatively small in their inception This class may include defects in the structural pathways, and if diseased, they are not uncommonly precipitated by emphasized injuries, shocks or infections

The gradation between organic nervous diseases and diseases of nonnervous tissue is frequently difficult to analyze and differentiate, hence we are led to assume that a complication of chemical and physiologic states exists, rendering a final diagnosis speculative or tentative We now know that a thorough history and an elaborate physical investigation are essential before a conclusion is reached, as both the history and the examination usually lead us in the diagnostic path, or, at least, are suggestive and therefore of diagnostic value

As we study our nervous problems we necessarily become convinced that defects in one or more systems are so closely interwoven that a syndrome of symptoms frequently provides a screen behind which we are unable to go in our efforts to outline a definite scientific diagnosis or prognosis, hence we emerge from our consultation room with a dubious mind We are almost daily confronted with new methods of investigation and research that require the assistance of the internist, or the specialist, with his modern apparatus and his painstaking efforts to exclude or include his theoretical findings The surgeon, with his mind bent on surgical prospects, strives to impress us with his surgical diagnostic knowledge, in order to convince both the neurologist and the internist that, fundamentally, their combined explanations are insufficient And he may attempt to draw from the neurologist's and the internist's intensive studies immaterial and irrelevant conclusions because a pathologic process is demonstrable

The endocrinologist is temporarily in the foreground, and we gasp and speculate as to whether or not he is on the right track He has so many theories to offer and so many deductions to declare that he sometimes obscures a possible diagnosis, or he may clear up some of our doubts by his investigation of ductless glands and his applications of remedies that may be of great value

Then too, the bacteriologist and the serologist confuse us greatly, they know we are all wrong and are willing to admit that they are right, and we bow our bewildered heads before the laboratory phenomena From their intensive studies, we are sometimes almost persuaded to admit that nearly every one may have a little syphilis in concealed areas, on the assumption that this disease has been promulgated through the centuries, yet remains in retirement for the reason that no positive evidences are presented to substantiate this view

Considering all these and other unmentioned possibilities of arriving at a tangible or tentative diagnosis, it seems permissible to conclude that the human race is constructed of poor materials, put together in a disorderly and disorganizable mass The patient, or the case, may be interesting from many points of view, but the individual who presents a multiplicity and a complexity of problems, together with his variegated life, his conglomerate up-bringing, his environment, his occupation and his social status, is really the one for our first consideration It is not astounding that he baffles us, and tempts us to treat him for what he is not In spite of all these mishaps, the psychiatrist and the neurologist have demonstrated their worth and distinction, based on the accomplishments and the elevation of their art in the past three or four years And they seem destined, ultimately, to occupy a higher plane in medicine than has been their lot heretofore The field of the psychoneurologist has been for many years the dumping-

ground for undiagnosed disorders, but today he is the watcher of the melting-pot of diseases With all of these recognized distinctions that have been showered on him, does he actually know how to treat his psychoneurotic patients, and why does he so persistently cling to the old methods of treatment, unless it be that he admits that the majority of his patients are studies almost beyond his comprehension?

Among the many modes of treatment that have been suggested to us, rest seems to be of uppermost importance It is common knowledge that many of our neurologic and psychiatric people are told that they are simply nervous and that what they need is a life filled with interesting and diverting occupations A number of them are sent on long and arduous trips in the belief that travel and change of scene, and life in the open air, carried on in a strenuous manner, constitutes the most highly beneficial treatment that can be employed Of these, many come back to occupy the same place they held before this unwarranted method was carried out It is quite true that in a few instances a strenuous life, provided it is well regulated and well ordered, among the types who are sufferers from nervous irritability, does help them remarkably An investigation of their former life shows they were sedentary and that their minds were glued to routine channels and their bodies to an office chair This type of man has a one-track mind devoted only to business, to which he applies himself overassiduously, and he provides no escape for his dissipated energies He becomes stagnant and stale, physically, nervously and mentally Put him under proper muscular discipline, regulate his habits, and sweat out the bankrupt skin and flabby muscle accumulations, and clean out his gastro-intestinal tract by normal physiologic methods, and he comes out clean, wholesome and well These cases, of course, must be carefully selected, but a large number of patients of this type are congenitally or constitutionally inferior, and need a prolonged rest in a suitable environment The tendency of the day is to have these people rest for a brief period and then get them up and push them about This can be accomplished only by a skilled attendant, and often the result is lamentable Give them a longer rest period, add to their diet, and see that they are rested, not only nervously but mentally Then, through a gradual process of exercise and outdoor life, they come back by degrees to a condition approaching a normal state It is among this class that we get those who have never been instructed as to the care of themselves, who know, indeed, nothing about ordinary health measures They become blockaded in their muscular, arterial and glandular systems It is among these people, too, that many cases of chronic invalidism are found, mainly because their condition was not recognized early and they were not put in bed with a definite object in mind We see, too, many instances of profound depressive states where a timely suggestion would put them to rights And these people, too, instead of being worked inordinately, physically and mentally, are the people who need a long, peaceful and well-ordered rest in bed

The developing dementia praecox patient, or the constitutionally inferior individual who has been crowding his life with all sorts of work and pleasure, with irregular hours and without sufficient rest, is the one who very soon shows his limitations, and his reconstruction requires excessive patience and a carefully directed line of treatment before he shows a prospect of improvement Unfortunately, among this class are the people of comparatively small means, or those who, perhaps, have dissipated their finances as well as their physical strength, and who are unable to carry out a comprehensive or a well-adjusted scheme of living We may, in many instances, be obliged to resort to halfway measures in order to meet the circumstances of the individual, and not infrequently they can be restored to a fairly balanced life and permitted to engage in occupations less strenuous

Exercise, in its various phases, is often carried too far, because the life of the individual has not been accurately analyzed and his exercise suited to his capacity Sending a mentally defective person to a gymnasium with some carelessly offered suggestions as to exercise is to be deprecated Frequently the overexercise of people who have just recovered from *minor or grave* infectious disorders, and who have an inherent constitutional defect, is detrimental rather than beneficial, and the exercise becomes a dangerous punishment rather than a relief

The question of foods is more important than we are accustomed to believe One rule holds good, however—that is, before a process of diet is inaugurated, the patient should be cleaned up inside and outside as well, and then it should be the function of the physician to put the gastro-intestinal tract into such order as will permit the individual gradually (and sometimes rapidly) to accustom himself to eating anything that is within reason Too careful dieting of the average man is a waste of time Almost any patient can be fed, and even forcibly fed (that is, be urged to eat) anything and everything that is good for him, while another man who goes about with a moderately poor diet list and a book on calories under his arm, and a fear and apprehension of food in his head, not only suffers himself, but brings suffering on his immediate associates

Baths are much overrated, unless they are applied for some specific purpose, such as a prolonged bath for an acutely excited patient It may be said, in passing that the average person does not know how to keep himself clean, and therefore a regulation of his bath toilet is not only beneficial from the point of cleanliness, but serves to improve his skin and muscle activity The ordinary warm bath and cool spray and the Scottish douche are applicable to many, and they are among our best therapeutic agents When we send our patients to resorts for baths we are simply transferring the individual from one climate to another, and perhaps by force of example he bathes, as he should, more often than is his custom We get him out of his old environment, he is taught how to employ his time, and he looks forward to his common, daily, ordinary bath with pleasure because it produces comfort and ease But most baths given in a routine manner, as is generally practiced at bath places, are more or less valueless They are on a par with the drinking of so-called mineral water and salt water, the beneficial result consists mainly in the larger intake of water than is practiced at home

Massage and its adjuncts are fads in the majority of instances, or they are ordered simply to employ and take up the time of the person, who, when he reaches a certain point, has little or nothing to do or who declines to take a normal amount of physical exercise

The average man who practices massage as a profession is not a very great help to the neurologist He may be trained in his specialty, but he is not trained in his mind, and he assumes that massage is the one and only factor in the treatment of disease, just as the new schools of therapy (the osteopathic and the chiropractic) claim to accomplish marvelous results irrespective of other methods of treatment It is undoubtedly true that these so-called practitioners do much good, because they have the knack of inspiring the patient with the wonderful results of their treatment And yet, who has not seen the disastrous results following the indiscriminate prescribing of massage in any of its forms?

Following this line are the newer cults who practice strange and inexplicable forms of healing They employ suggestions, but not the suggestion based on the scientific method of the neurologist Their system of analysis is inadequate, to say nothing of being unscientific Their methods of treatment are bolstered up by all-impressive notoriety backed by the newspapers and heralded from mouth to mouth by the credulous Occasionally a medical man sees the application of suggestion and healing by his impressiveness, and he seeks a wild and remote spot and from this point he permits to leak out the fact that he is a wonder Within a remarkably short period of time the defectives and the chronically, constitutionally inferior people hear, with widely open ears, of his wonderful cures It is related that one man in an Eastern state, after graduating from a well-known Eastern university with a full-fledged degree of M D, established a few barrels of concoctions, gave his awestruck patients a rapid ocular examination, and sold them a bottle of medicine for a price that would be acceptable as an ordinary fee for the average medical man He finally grew tired of attempting in any way to analyze his patients, and simply gave them a rapid glance, followed by the well-known bottle Eventually the crowds became so great that he issued "privilege" permits (for a substantial fee), in order that the patient should not be too long detained in the acquiring of his bottle of water and herbs Other healers have profited by the credulity of the public and have practiced their unholy schemes with financial benefit Now the country is overwhelmed by the so-called "Divine Healer," who admits that Christ practiced the healing art and produced remarkable cures, but that for nearly 2,000 years the art was lost until it appeared in him while yet a child He goes from city to city, and, with the aid of a devoted churchman, he fills the churches with the lame, the halt and the blind, and, offering a prayer, he lays his hands on these poor derelicts He heals them without money and without price, accepting what is donated by his grateful recipients, and it is said, without fear of contradiction, that he makes a very good living

When we come to the final analysis of the whole situation, and the treatment of chronic nervous diseases, the personal influence of the man in charge has much to do with improvement and recovery, provided he is endowed with the qualities of a disciplinarian and the courage of his convictions after he has made a thorough and careful examination and has outlined a course of treatment that is right for the individual The mere fact that people have faith in their physicians is confirmed all over the world, and when they are presented with a proposition put in a plain, common-sense and direct way, the cures of their physician far exceed all of the cures that are effected by the faker and the charlatan But the physician's inordinate modesty and his ethical sense prevent him from acquiring a widespread influence which might be of great benefit to others who know nothing of him, his methods, and the application of the scientific mind to the treatment of disease

SUMMARY

If it were within the power of the neurologist to treat the rich as well as the ordinary classes, they should be given the same strenuous treatment This perhaps will not appeal to physicians generally, as it would mean a vast reduction in their fees But, taking the majority of patients who consult the neurologist and psychiatrist, isolation from their former surroundings, confinement in a well-ordered hospital, and the prohibition of visitors should be rigidly adhered to Nervous and mental patients do better when they have been regulated by correction of their physical disabilities and forced to follow a definite mental disciplinary line of treatment This includes all that may be said of enforced rest, not for weeks, necessarily, but perhaps for months These people come to us depleted in their physical and nervous forces, and a period of rest is needed to balance the years of bad living that bring them to the house of the physician The establishment of order by discipline applies equally well to the physical as to the mental attitude of the patient, and this can be done successfully only by one who is trained for this work It is better to make a few mistakes through overdoing this method of treatment than to make many mistakes by underdoing it

Baths of simple type—warm tub, cool spray or Scottish douche—are of more value than many drugs

Exercise of the graduated type during the convalescent period is of tremendous value, provided it is carried over many days and weeks and with but moderate increase in the time given to such exercise

Sufficient examination should be made from time to time to assure the physician, as well as the patient, that nothing important is overlooked The ordinary routine visits must be suspended at intervals to make this impression lasting

One person should be responsible for the patient, and only minor details should be left to subordinates The patient should be left alone, and without a special nurse, as soon as possible, otherwise he becomes dependent on the nurse not only for his physical but for his mental habits

It has been found that massage is not absolutely essential either to the patient's comfort or to his improvement—that his state of mind and his attitude toward himself and others evoke sufficient mental activity to keep him physically fit

The coddling of patients should be eliminated Giving way to the wishes of the patient, when we know that doing so is detrimental to his progress, is a backward or retrogressive step They should all be held firmly in hand by the personal influence of the attending physician, and this rule should not be relaxed until convalescence is well established

Occupation, unless it is carried on by a trained and skilled worker, is of very little value, and means only the use of time which might be employed in a more profitable manner

Many patients require a firm, guiding hand Others require the influence of a strong and dominating will, together with mechanical or drug restraint, and con-

finement in a suitable room If this method of treatment is begun early in selected cases, the recovery is much more rapid and satisfactory

ABSTRACT OF DISCUSSION

DR FRANK R FRY, St Louis The neurologist must support himself by reliable internists With data thus obtained he can decide the physical and the psychic side of each situation that he is handling By checking up our cases carefully from the physical side, we can more readily determine how to handle them from the psychic side Compared with this the technic of a rest cure is of secondary importance

DR ROSS MOORE, Los Angeles The suggestion of not having a special nurse is a very important one not allowing the patient to be treated, but to have his mind focused on what he himself has to do in order to get well I do not like massage, except when a patient is so physically run down that he needs it for physical reasons Patients get the idea that massage or hydrotherapy, or what not, will make them well Along the same line is the question of relaxation

DR C R WOODSON, St Joseph, Mo It is hard to lay down a set of rules by which to treat nervous men and women Rest is excellent in the treatment of some patients and is desirable In some cases continuous rest is not desirable In some cases it is impossible for a time to get rest and no one has ever shown us how to get it A business man who has broken down and is badly depressed must be taken care of and exercised by an entertaining nurse, one who can divert the patient A maniacal, badly depressed patient, with elevation of temperature, acceleration of heart action and in a constant state of muscular and mental agitation must be looked after constantly Feeding is necessary For a patient who will not eat regularly, tube feeding is necessary If a patient who is badly depressed is left alone, he will kill himself, and this is not to be desired A maniacal patient should not be left alone as he will bruise himself on the walls or bed, will expose himself by getting the covers off his bed or getting on the floor and will contract pneumonia As to filling a patient with drugs no neurologist or internist will want to do this, as it will not have the desired effect It is impossible to lay down a set of rules for the treatment of insane patients Persons who suffer from a mild neurosis may be treated as Dr Jones suggests A person who can divert a melancholia patient and who can get his mind off of himself, who will go walking with him, will be good for him If you lock the melancholia patient up and tell him he must rest, he will not be satisfied If you shut out his friends he will not be satisfied

DR H CLIMENKO, New York One form of psychoneurosis has baffled me This is the anxiety neuroses with marked vasomotor symptoms following a psychic trauma This neurosis occurs usually in middle aged people, both men and women The patient is really not insane He cannot adjust himself to his environment These people are always brooding over the wrongs done to them Every time they think of the psychic trauma they become covered with a cold perspiration, develop a rapid pulse, and frequently irregularities of the pulse due to extrasystoles may be present I have succeeded in curing a small number of these patients by introducing new interests in life These interests were always of an ideal character The large majority of these people were not amenable to any known form of treatment

DR W T WILLIAMSON, Portland, Ore The point at issue is simply the question as to the particular quality and character of the patient One individual requires a certain form of treatment, while another person with exactly the same trouble will require a method of treatment which is exactly the reverse of that employed in the former case Rest is, perhaps, most generally necessary for those whose nervous system is run down, and very often it is required that this rest be prolonged, the patient carefully watched and treatment carried to the degree set forth by Dr Jones Experience has shown, I believe, that rest, properly watched, is the most helpful form of treatment for that class of people called neurasthenics, and that extremes of treatment should be employed only in those cases where we have more definite psychic derangements Rest carried to the extreme, which was opposed by Dr Woodson, would, of course, be wrong Rest can be abused

If a patient who requires watchfulness to protect him be deprived of a special nurse while having that rest the results of rest would not only be nullified but the patient himself would be exposed to additional dangers We must not have a general system of treatment for any disease The physician who treats a disease on the basis of its name is bound to blunder We must simply take the individual as we find him, forget for a moment the name of the disease from which he is suffering, and treat him according to the conditions found, not following any stereotyped methods

BOTULISM FROM CANNED BEETS

REPORT OF CASES AT FLORENCE, ARIZONA

W G RANDELL, M D
FLORENCE, ARIZ

In this outbreak of botulism the food at fault was undoubtedly commercially canned beets in tin containers, as they were the only article of food eaten by all of those who died The other canned foods—corn, nominy and string beans—were all thoroughly cooked after being taken from the can, but the beets were taken from the can and served with a little vinegar poured over them No offensive odor was detected on opening the can of beets At the noon meal, May 12, there were three Indians, two white men and Mrs Lyles One Indian did not eat any of the beets He was unaffected and is well today Mrs Lyles only tasted them to see how they were, as she does not like beets The two Indians and the two white men who ate beets at this meal died The Indians were not there for the evening meal What was left of the beets were served that evening, and Charles Reynolds, who was not there at noon, ate most of them Mrs Lyles is certain that the four children ate some, but very little Unfortunately, none of the beets were left The empty can was thrown out on the ground and recovered later Investigation of the dried juices in the can is still progressing

It is to be hoped that out of the research work being done at present, some effective treatment may be perfected As yet, the antitoxin is of little or no effect and supportive treatment is very discouraging as evidenced by the history of the last two who died, one lingering five days and the other six, their progress being so slow that I was encouraged to think that nature might be able to eliminate the toxins

REPORT OF CASES

CASE 1—G O Brown, aged 27, weight 160 pounds a strong, healthy man, came to the Pinal County Hospital May 13 about 7 a m accompanied by Mr E Lyles He complained of dimness of vision, diplopia (in order to see clearly he had to close one eye) slight headache and a feeling of oppression in the epigastrium The pupils of the eyes were slightly dilated, and there was little or no reaction to light or accommodation His gait was slightly staggering, he complained of some difficulty in swallowing and in speaking he had difficulty to articulate clearly He was pale and the expression of his face anxious Earl, that morning before daylight he had left the house to attend to some stock and in returning, could not walk very well, and part of the way came back on his hands and knees I suspected the condition and urged him to stay in the hospital

then, but he insisted on returning to the ranch for a short time On the way, he was nauseated and vomited several times He was the only one of the five who vomited or had any pain He was given 2 ounces of magnesium sulphate I went to the ranch in order to see Jose Pablo, one of the Indians Brown was looking about the same He was lying down About noon, he came into the hospital and, from then on, his progress was steadily worse The pulse was strong and full until the last few hours, not above 100 The temperature also was most of the time normal and at the highest, was 101 He continually became more restless, throwing himself from side to side in the bed There was no diarrhea The difficulty in swallowing increased until by Friday night it was almost impossible, and completely so by Saturday morning We administered saline enemas about every three hours to maintain body fluids The voluntary muscles of the body seemed partially paralyzed, though up to thirty-six hours before death the patient could get out of bed The last twenty-four hours, the cervical muscles seemed to be paralyzed and, when he would roll from side to side of the bed, he would grasp his hair and pull his head into a comfortable position During the last twenty-four hours attacks of the cyanosis and respiratory failure came on with increasing frequency, until he died at 1 p m The last twenty-four hours, there was paralysis of the anal sphincter and he could not retain fluids

CASE 2—Jose Pablo, an Indian, aged about 18, was taken sick at the same time as Brown and Lyles I saw him at noon of the 13th He refused to go to the hospital and was later taken to an Indian village I saw him only once At that time he was completely prostrated he could not talk the throat was paralyzed saliva flowing from the mouth, and he had to raise his head with his hands The cervical muscles were paralyzed The pupils did not react to light or accommodation and they were slightly dilated When asked if he had double vision or difficulty in seeing, he answered in the affirmative He suffered no pain and died some time the following night

CASE 3—John Robinson an Indian, the third man to die was about 30 years of age, and weighed about 150 pounds He began to feel ill Thursday morning but kept on working until night I saw him Friday morning at his home He was lying down but got up and walked about quite easily with a slight stagger He complained of diplopia dimness of vision, and slight vertigo He could talk, but articulation was not distinct There was some difficulty in swallowing The pupils of the eyes were slightly dilated, there was no reaction to light or accommodation I saw him again Saturday morning He was weaker he could hardly swallow and his speech was impossible to understand There was a flow of ropy saliva which he was continually wiping out of his mouth The pulse was 90 temperature normal Sunday morning I persuaded him to come to the hospital, as I expected to obtain a supply of antitoxin With assistance he walked from the automobile into the hospital Sunday his temperature was slightly subnormal all day The highest pulse rate was 118 He was given enemas of physiologic sodium chlorid solution every three hours and retained them until 2 p m Bowel movement became involuntary He was not given antitoxin From then on physiologic sodium chlorid solution was injected under the skin He was very restless At 11 p m, I passed a stomach pump and gave 8 ounces of equal parts milk and water The fluid may have caused pressure on the diaphragm, or the passage of the tube may have been a shock to the already exhausted sympathetic nervous system Anyway, he collapsed and died about fifteen minutes later He was conscious almost to the last

CASE 4—Mr L Lyles, aged 48, weight 158 pounds, came to the hospital at 7 a m Thursday, with G O Brown He also complained of dimness of vision and diplopia The pupils were slightly dilated and did not react to light or accommodation He complained of some weakness, his gait was staggering his speech was thick and he had some difficulty in swallowing He was given 2 ounces of magnesium sulphate with good results He went home with Brown and returned with him to the hospital about noon Paralysis of the pharynx, esophagus and cervical muscles was progressive but slow, the pulse was full and strong, and most of the time under a hundred Monday, it went to 120 The temperature was normal most of the time, but once, Sunday evening after an infusion of 500 c c of physiologic sodium chlorid solution, it rose to 101 4 I succeeded in getting antitoxin from Miss Jane Ryder of the state health department and gave him 10 c c Sunday at 3 p m and again Monday at 8 a m with no effect in the progress of the disease The last twenty-four hours, there was considerable cyanosis and difficulty in breathing The patient was conscious and realized that he was dying The last twenty-four hours, bowel movement was involuntary Up to within a few hours of his death, he was able to rise in bed, but could not control the cervical muscles and had to lift his head about with his hands He died at midnight, Sunday

CASE 5—Charles Reynolds, aged 21, weight about 160 pounds first complained of symptoms Thursday morning, but worked most of the day His case progressed much more slowly than any of the others so much so that I thought his condition might possibly be due to hysteria The temperature was normal and the pulse 80 full and strong He came to the hospital Saturday at 11 a m The eye symptoms then were well developed, diplopia no reaction to light and accommodation, pupils slightly dilated He was having some difficulty in swallowing but was drinking all of the milk and eggs he wanted and continued to do so until Sunday night Monday, he took 3 ounces of milk He was given physiologic sodium chlorid solution by proctoclysis to maintain the body fluids At 4 p m, he was given 10 c c of antitoxin and at 8 p m 10 c c more The temperature after the second antitoxin injection went to 100 6 but dropped to normal in a few hours Tuesday he could not swallow at all but aside from the distress in the throat and the necessity for frequently clearing the mouth of the profuse, ropy saliva he rested very quietly He had at no time any pain Tuesday he gradually became more cyanosed and restless At 2 p m, he was given 30 c c of the polyvalent antitoxin but with no effect At 6 p m he could no longer retain enemas, and bowel movements were involuntary Tuesday night he became more restless, very anxious and distressed until 5 a m Wednesday morning when he died He was conscious almost to the last

CASE 6—Mrs Lyles complained of difficulty in swallowing and slight dimness of vision which began Friday This continued, with severe prostration for seven or eight days

when the symptoms gradually subsided She was given 10 c c of antitoxin on Sunday Whether her condition was due to poison or to hysteria is difficult to say, but she is not of a neurotic temperament and has been very self-possessed and I am inclined to think that she was slightly poisoned

Three of the four children also complained of trouble in swallowing, and they were so prostrated that in walking about their feet seemed heavy The oldest girl Margaret was so weak that she had to be lifted out of the bed when she wanted to get up even ten days after the poisoning When she left here she could not step into the car without assistance She is about 9 years of age

CHARACTER OF TREATMENT

Treatment, aside from the injection of the antitoxin, was wholly supportive I found after observing Brown's condition and the use of codein and morphin to quiet him, that if supplied a sufficient amount of water, either by proctoclysis or hypodermoclysis, the restlessness was so much relieved that opiates were unnecessary Strychnin, atropin, digitalis and strophanthin were administered whenever indicated but, apparently, with no effect Because of the effect that pituitary extract has in stimulating involuntary muscle action, I thought it might be of some value in relieving the paralysis of the pharynx and esophageal muscles, and in three cases I administered it every four hours, but with no beneficial effect and possibly some aggravation

New and Nonofficial Remedies

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION W A PUCKNER, SECRETARY

POLLEN EXTRACT PREPARATIONS (See New and Nonofficial Remedies, 1920, p 226)

POLLEN ANTIGEN-LEDERLE (FALL TYPE)—A liquid obtained by extracting equal parts by weight of dried pollens of ragweed, goldenrod, wormwood, and maize (Indian corn) by a vehicle of 67 per cent glycerine and 33 per cent saturated solution of sodium chloride It is standardized so that each Cc contains 14 000 pollen units, a pollen unit has been arbitrarily chosen by Koessler, Noon and Freeman as the equivalent of one-millionth gram (0 000001 Gm or 0 001 Mg) of pollen The Hygienic Laboratory has prescribed no U S Standard of Potency The antigen after preparation is made into fifteen different dilutions by the addition of a proper amount of the glycerine-sodium chloride solution diluent

Actions and Uses—See general article, Pollen Extract Preparations, New and Nonofficial Remedies 1920, p 226

Dosage—The product is supplied in fifteen different doses Each dose consists of 0 1 Cc of the respective dilution Accompanying each dose is a vial containing 9 Cc of sterile water with which to make the pollen antigen of isotonic strength immediately before administration For prophylaxis, the complete series (doses 1 to 15) containing progressive amounts of pollen protein should be given beginning about six weeks before the hay-fever season For treatment of an actual attack of hay-fever, fewer doses are generally sufficient

Manufactured by the Lederle Antitoxin Laboratories New York No U S patent or trademark

Pollen Antigen Lederle (Fall Type) Series A—Marketed in packages of five vials containing for each consecutive dose (numbers 1 to 5 inclusive) 2 5 5 10 20 and 25 pollen units respectively and five vials of sterile water with which to make the proper dilution of each dose

Pollen Antigen Lederle (Fall Type) Series B—Marketed in packages of five vials containing for each consecutive dose (numbers 6 to 10 inclusive) 30 50 75 100 and 150 pollen units respectively and five vials of sterile water with which to make the proper dilution of each dose

Pollen Antigen Lederle (Fall Type) Series C—Marketed in packages of five vials containing for each consecutive dose (numbers 11 to 15 inclusive) 250 375 500 750 and 1 000 pollen units respectively and five vials of sterile water with which to make the proper dilution of each dose

Pollen Antigen Lederle (Fall Type) Complete Series—Marketed in packages containing 15 doses as described in Series A B and C above

Pollen Antigen Immunity Test—Diagnostic Test for Fall Type Hay Fever Lederle—Consists of 0 01 Cc of No 15 dilution of pollen antigen Lederle (fall type) It represents 100 pollen units of the combined pollen protein May be used cutaneously or intradermally

OVARY (See New and Nonofficial Remedies 1920, p 201)

Whole Ovary-H W D—Whole ovarian glands of the cow, including the corpora lutea, selected, freed from extraneous matter and dried *in vacuo*

Actions and Uses—See general article, Ovary, New and Nonofficial Remedies, 1920 p 201

Dosage—5 grains or more daily modified to meet the requirements of the special case. Whole Ovary-H W D is sold in the form of tablets only (see below)

Manufactured by Hynson Westcott & Dunning Baltimore No U S patent or trademark

Whole Ovary Tablets H W D 5 grains—Each tablet contains whole ovary H W D 5 grains

Whole Ovary H W D is a yellowish powder having a peculiar odor it is partially soluble in water

One part represents approximately 5 parts of the fresh animal ovary

BENZYL BENZOATE (See New and Nonofficial Remedies, 1920, p 49)

Benzyl Benzoate (Abbott)—A nonproprietary brand of benzyl benzoate complying with the N N R standards

Abbott Laboratories Chicago No U S patent or trademark

Elixir Benzyl Benzoate (Abbott)—A solution compounded of 20 per cent benzyl benzoate (Abbott) 70 per cent. ethyl alcohol absolute flavoring and water to make 100 per cent

Dosage—20 drops to 2 teaspoonfuls well diluted with water or milk May be repeated in one half to one hour

Tablets Benzyl Benzoate (Abbott) 2 grains—Each tablet contains benzyl benzoate (Abbott) 2 grains with charcoal as a vehicle

Dosage—2 to 5 tablets at intervals of one half to one hour continued to effect (up to 20 grains) Follow each dose with a hot drink—water or milk

Benzyl Benzoate (Fritzsche)—A nonproprietary brand of benzyl benzoate complying with the tests and standards for benzyl benzoate

Fritzsche Brothers Inc New York

Benzyl Benzoate (Merck)—A nonproprietary brand of benzyl benzoate complying with the tests and standards for benzyl benzoate

Merck & Co New York

Benzyl Benzoate (Organic Salt & Acid Co)—A nonproprietary brand of benzyl benzoate complying with the tests and standards for benzyl benzoate

Organic Salt and Acid Co New York

FERRIC CACODYLATE—Ferri cacodylas—Iron Cacodylate—A ferric salt of cacodylic acid containing from 39 7 to 44 9 per cent arsenic (As) (See New and Nonofficial Remedies 1920 p 44)

The following dosage forms have been accepted

Ampules Ven Iron Cacodylate, 0 03 Gm (½ gr)—Each ampule contains iron cacodylate 0 03 Gm (½ gr) in 1 Cc

Ampules Ven Iron Cacodylate with Sodium Chloride 0 03 Gm (½ gr)—Each ampule contains iron cacodylate 0 03 Gm (½ gr) in 1 Cc of physiological solution of sodium chloride

Prepared by the Intra Products Co Denver Colo No U S patent or trademark

The ferric cacodylate used in the preparation of ampules ven iron cacodylate complies with the following tests

A 5 per cent solution of ferric cacodylate affords no precipitate with silver nitrate test solution or with barium chloride test solution nor does it show an immediate blue or green color upon addition of potassium ferricyanide test solution nor does any turbidity occur when 1 Cc calcium chloride test solution is added to 5 Cc of this 5 per cent solution

No yellow precipitate is produced in a 5 per cent solution by ammonium molybdate test solution or by sodium thiosulphate test solution

If the iron be removed by precipitation with ammonium hydroxide filtered and make acid with hydrochloric acid it should afford no more than a slight color upon the addition of an equal volume of hydrogen sulphide test solution

If 0 1 Gm ferric cacodylate in 8 to 10 Cc water be placed in a stoppered test tube with 2 Cc hypophosphorus acid or 1 Gm stannous chloride acidified with hydrochloric acid it should develop the disgusting odor of cacodyl within an hour

Assay Dissolve 0 2 gm ferric cacodylate in 100 Cc water titrate with tenth normal sodium hydroxide using phenolphthalein as indicator Each Cc of tenth normal sodium hydroxide is equivalent to 0 01557 Gm absolute $Fe[(CH_3)_2AsO_2]_3$ this should assay from 82 5 to 87 1 per or 37 9 to 41 9 per cent Arsenic

THE ARREST OF HEMORRHAGE

The clotting of blood is a complicated process, the explanation of which is still being debated The importance of the problem involved can scarcely be denied, however, for it concerns not only the natural arrest of hemorrhage from wounded blood vessels, but also the management of the dangerous conditions that may arise in hemophilia One indispensable factor in coagulation is the formation of the insoluble protein fibrin from an antecedent fibrinogen existing in solution in the plasma There is a second generally admitted essential agency, known as fibrin ferment, or thrombin, which is not present, in active form at least, *in the circulating blood, but is formed when the blood* is shed Sometimes, under abnormal conditions, it arises within the blood vessels, so that an intravascular clot may appear When one begins to inquire how and when the fibrinogen, thrombin and other less generally admitted factors interact to produce coagulation of the blood, the uncertainties and conflicts of current hypotheses are at once brought to notice

It is well known that whereas contact of shed blood with an ordinary foreign surface is sufficient to induce coagulation, the plasma fails to clot rapidly when it is brought into contact with perfectly clean, smooth surfaces, and particularly such as are coated with a greasy layer of paraffin or oil In explanation of this circumstance, Tait [1] has concluded that the blood contributes in two different ways toward arrest of hemorrhage from a cut vessel First, certain of the cells agglutinate at the cut end so as to form a plug, second, the plasma undergoes coagulation

A special though poorly defined rôle has long been assigned to the platelets in the phenomena of coagulation Tait now asserts that the way in which nongreasy foreign matter induces coagulation is by affording a suitable physical surface to which the labile platelets or spindle cells, latterly called thigmocytes, can adhere Such adhesive cells are highly phagocytic toward particles of nongreasy matter When they make an undue effort to ingest foreign matter, the cells often stretch and disintegrate sufficiently to allow thrombin within them to exude, whereupon clotting occurs On this hypothesis it is possible to understand that clotting fails to manifest itself when blood is confined within smooth surfaces, because the cells remain intact and no thrombin exudes Likewise when anticoagulants, such as oxalates or citrates, are added to blood the thigmocytes remain unaltered

From the standpoint of Tait's hypothesis, the primary event in the natural arrest of hemorrhage from a wound is local adhesion of labile cells in the form of an agglutinum, which plugs the cut end of the vessel By adhesion to the extra-endothelial edge, these cells acquire adhesiveness to other unaltered cells of the same kind (sometimes to blood corpuscles of other *kinds as well), and so on in succession, in this way the* plug is built up If this explanation proves to be correct, it is interesting to note, as Tait points out, that the variety of cell which is assumed to furnish thrombin by cytolysis and thus cause clotting of the plasma is likewise responsible for the formation of the plug In other words, the same cell may contribute in more than one way to the arrest of hemorrhage The theory of thigmocyte function therefore demands further consideration, especially in relation to hemophilia and intravascular thrombosis

THE TREATMENT OF MYXEDEMA WITH THYROID EXTRACT

Although the condition now recognized as hyperthyroidism of adults was described as early as 1873 by Sir William Gull, the name myxedema was not coined until 1878, when Ord employed this designation for the phenomena of the subcutaneous tissues which he observed at necropsy The increased thickness of the skin, the "solid edema" of the malady, was attributed to an abnormal abundance of mucin, hence the name The relation of myxedema to the loss of function of the thyroid gland was not appreciated until the surgeons Reverdin of Geneva and Kocher of Berne described the similar condition that followed goiter enucleation The investigations subsequent to these observations led in turn to a more careful study of the effects of experimental thyroidectomies in animals, and of the influence of thyroid transplantation or administration of preparations of the glands

These researches paved the way directly for the present-day therapy of myxedema, which has been described as one of the most remarkable achievements of medicine, it is, in fact, the best example of successful organotherapy THE JOURNAL cannot overlook the opportunity to refer to the life history of the first myxedema patient treated by thyroid extract The death of this woman has just been recorded by Dr George R Murray,[1] who proposed the treatment for

1 Murray G R The Life History of the First Case of Myxoedema Treated by Thyroid Extract Brit. M J 1 359 (March 13) 1920

her and initiated the relief Following the suggestion of Sir Victor Horsley that myxedema, cretinism and cachexia strumipriva might be benefited by grafting a portion of healthy thyroid gland in persons suffering from these diseases, a favorable result seemed to have been secured in this way by Bettencourt and Serrano [2]

This in turn led Murray to attempt thyroid therapy The first patient, a married woman, aged 46 was shown at a meeting of the Northumberland and Durham Medical Society in England, Feb 12, 1891 She presented a typical case of myxedema of several years' standing Murray stated his intention of treating her with thyroid extract, and the therapy was begun, April 13, 1891 The description of his procedures deserves being recorded in his own words

> The experimental nature of the treatment was explained, and the patient realizing the otherwise hopeless outlook, promptly consented to its trial In order to insure that the extract was properly prepared, the thyroid gland was removed from a freshly killed sheep with sterilized instruments and conveyed at once in a sterilized bottle to the laboratory where the glycerin extract was prepared This extract was afterward included in the British Pharmacopeia of 1898 as "liquor thyroidei" A hypodermic injection of 25 minims was given twice a week at first, and later on at longer intervals The patient steadily improved

At the end of three months the injections were given at fortnightly intervals Later when Fox and Hector Mackenzie had demonstrated the efficacy of oral administration of thyroid extract, Murray's patient received 10 minims by the mouth six nights a week On this dose she remained in good health and free from the signs of myxedema She continued to take liquid thyroid extract regularly until 1918, when difficulties in the supply of this preparation led to the use of thyroid tablets The woman enjoyed excellent health until 1919, when she died of cardiac failure at the age of 74 Murray concludes the story of the historic case

> This patient was thus enabled, by the regular and continued use of thyroid extract to live in good health for over twenty-eight years after she had reached an advanced stage of myxedema During this period she consumed over 9 pints of liquid thyroid extract or its equivalent, prepared from the thyroid glands of more than 870 sheep

In the United States, the first patient with myxedema similarly treated by Kinnicut in 1892 was a woman who had been ill twelve years If anything were needed at present to make the prognosis in myxedema favorable, Murray's simple yet eloquent record would easily bear remarkable testimony Evidently the duration of life need not be shortened by simple atrophy of the thyroid if suitable treatment is instituted The science of medicine may well rejoice on this account The success of thyroid therapy in myxedema was not an accident or the outcome of empiric findings, it is a triumph of scientific research

THE REPAIR OF PERIPHERAL NERVE INJURIES

Among the varied physiologic damages attributable to war wounds, the injuries to peripheral nerves offer a surgical problem of peculiar and often perplexing difficulty When there has been a severance of continuity in a nerve, the ideal restorative procedure consists in bringing together the parted ends and attempting to secure union and regeneration by an end-to-end suture Such a logical operation is by no means always possible, owing to the extent and character of the injury involved Hence, the possibility of the transplanting of nerve segments to bridge an otherwise unconquerable gap has been proposed The choice of sources for what has been termed an autotransplant in the patient himself or a homonerve transplant from another individual of the same species will naturally be restricted to such nerves as are less essential in the bodily functions In human surgery, segments taken from the cutaneous radial, the musculocutaneous and the crural nerves have been suggested as possibilities

It has been known for some time that transplanted nerve segments undergo structural change after transplantation It therefore occurred to Lewis and Huber, who have been engaged in extensive studies of the repair of peripheral nerve injuries for the Surgeon-General's Office, that the process of regeneration through a nerve transplant might be facilitated and hastened by using as a transplant a segment of a nerve already in wallerian degeneration The experience gained by Huber [1] in an experimental investigation of this question showed no preference for either type of transplant Regeneration was secured, for example, when a segment of degenerated nerve from the sciatic was used to bridge a defect in the resected ulnar nerve of the same animal There was no indication, however, that regeneration took place more satisfactorily and more rapidly than it would have taken place if an undegenerated autonerve transplant had been used

The experiments of Huber and his surgical collaborators show that degenerated autonerve and homonerve transplants may be used with assurance of success if an opportunity arises This is a helpful finding, for in practice it is not always easy to secure fresh transplants, and it is particularly difficult if they are to be secured from the patient himself Given the possibility of using degenerated segments of human nerves, how are the latter to be stored? French surgeons [2] have already reported the use of human nerves stored in petrolatum at approximately 2 C (35 6 F) for periods varying from two to five weeks Huber has found liquid petrolatum at ice chest temperature (3 C , 37 4 F) preferable Nerves have been stored in this way for forty days and still found useful

1 Huber C G Repair of Peripheral Nerve Injuries, Surg Gynec & Obst 30 464 (May) 1920
2 Dujarier and François Bull January 1918

Huber finds no reason why longer storage without loss of transplanting value may not be possible

Nerve fragments removed with proper aseptic precautions may also be stored in 50 per cent alcohol for the purposes of transplantation It cannot be supposed that any part of the tissue retains its viability under such conditions, hence, as Huber asserts, the value of the transplant is not dependent on the presence of living sheath cells There is no question of the nerve fibers of a nerve segment stored in 50 per cent alcohol undergoing wallerian degeneration as does the peripheral part of a nerve after section The neurilemma sheaths maintain and through these the central neuraxes reach the distal nerve segment

Sometimes the disparity of size between the transplant and the resected nerve offers a serious practical difficulty It is now proposed to meet this by suturing several of the fragments of smaller diameter between the larger resected ends when this situation is encountered This has been spoken of as a cable-nerve transplant Huber has summarized the results of all experimental work on nerve transplantation with the conclusion that the most favorable results are to be obtained after the use of an autonerve transplant, and for practical surgery a cable-autonerve transplant, several segments of a cutaneous sensory nerve being utilized to bridge a defect in a large motor-sensory nerve The question of the type of nerve, he adds, is not material, the question of the funicular arrangement is of secondary importance, whether the central or the distal end of a transplant is placed centrally is not necessary of consideration, accurate end-to-end suture, careful technic and a dry field are essential Whether the employment of sheaths about nerve suture lines or transplants is of positive value in preventing connective tissue proliferation still remains to be definitely ascertained

SOME ASPECTS OF DESERT CLIMATES

How the body adjusts itself to unusual changes in its environment has always been a problem of interest to those who have to deal with the living organism The problems of adaptation to altitude, for example, have become of more than mere academic interest since the development of aerial flight by man Likewise, the mechanism for adjustment to extremes of temperature has aroused attention in greater degree as man has begun to penetrate the Arctic regions and the tropics in consequence of the improved facilities for transportation to almost every region of the earth

Among the scientific observations made during a recent expedition to the Egyptian deserts[1] are indications that under the peculiarities of climate there encountered a slight though unmistakable increase in red blood corpuscles may occur This is analogous to the well known increase that is exhibited by man transported to considerable altitudes, where the reduced partial pressure of oxygen evidently becomes a stimulus for the mobilization of an added number of oxygen-carrying corpuscles in the circulating medium of the body As deficiency in oxygen cannot be held responsible for an increment in erythrocytes and hemoglobin in the blood at the low altitude of the Egyptian desert, some other explanation must be sought for the phenomenon recorded Special studies have demonstrated that it cannot be explained by any notable concentration of the blood in the tropical climate The most tenable hypothesis thus far advanced charges a stimulation of the blood-forming organs to peculiar and intensive light conditions that prevail in the desert Thus it has also been shown experimentally that exposure to the light of the mercury arc may produce increases in erythrocytes in animals[2] If this assumption proves to be correct, a new aspect of climatology will have been emphasized in the hematopoietic influence of sunlight

It might be assumed that the severe heat of the desert would lead to extreme production of sweat and correspondingly a considerable output of chlorid through the skin This would be in harmony with the belief that in tropical climates increased output of water is synonymous with increased secretion of sweat Wohlgemuth's[1] studies at Assuan showed, however, that this view is not tenable The increased water elimination under the climatic conditions of the desert occurs essentially through the medium of so-called insensible perspiration Accordingly, the chlorid content of the blood is unaltered even when the loss of water from the body is considerable under the trying conditions of life in the desert

Current Comment

GRADUATE MEDICAL EDUCATION IN THE UNITED STATES

The development of graduate medical education in the United States is a matter of the utmost importance Of the twenty-one cities having the largest population according to the census now nearing completion, all but two have undergraduate medical schools, but in only ten is any graduate medical instruction being offered, and in only four[3] are the facilities well organized and centrally administered In the other six, either the one school which exists has very meager teaching facilities or there are several independent noncooperating institutions, in no one of which can the student secure satisfactory instruction In this connection the New York Association for Medical Education, previously referred to in THE JOUR-

3 Boston New York Philadelphia and Minneapolis

NAL,[4] is working in the right direction All the facilities for graduate teaching in that city are to be administered through a central office from which the student will be promptly directed to the place where he can obtain the particular line of instruction he is seeking The association, furthermore, is aiding materially in the organization and development of the clinical facilities of that city For example, its first bulletin, recently issued, sets forth a standard course for specialists in diseases of the ear, nose and throat It also names the various institutions in New York which are giving courses of instruction in this specialty, and, it is stated, these courses have been reconstructed in order to meet the association's standard In order that thoroughly qualified teachers may be retained for the graduate schools, a larger fee than heretofore is being charged for tuition This larger fee, however, is not objectionable when the physician finds he can obtain the character of work desired Since the reorganization, all courses are said to have had a full enrolment, which shows that physicians appreciate the improvement made In fact, the New York association is in a position to refer students to courses in other parts of the country if they are brought up to a reasonable standard of excellence The experience in New York points to the importance of developing graduate medical courses in other large cities of this country Instead of only four cities in which clinical facilities to any considerable extent have been organized and centrally administered, there should be twenty or more cities in which the abundance of clinical material might be organized and made available for teaching purposes Since the war, which shut off many of the opportunities for graduate instruction in Europe, America not only has a great opportunity, but also an actual duty to perform in supplying equal if not better facilities for such instruction This would not only result in a better use of the clinical material, it would also aid in the development of clinical teachers, it would improve clinical methods in hospitals and there would be a constantly increasing number of better trained physicians and ultimately a better care of patients generally Furthermore, development of graduate instruction would not only be of benefit to the physicians and the public of this country, but in time would attract students from South America and other countries, and the reputation of the United States in medical education would be greatly enhanced

OBSERVATION ON THE DIGITALIS PLANT

So long as galenic preparations of drugs continue to be used, and so long as thoroughly accurate methods of standardization, either chemical or biologic, for the active ingredients are not available, it will be important to learn as much as possible about the variations to which the crude products, out of which our extracts and tinctures are prepared, are subject under natural conditions The physiologically potent alkaloids and glucosids that occur in many medicinal plants have been variously regarded by pharmaceutical botanists By some they have been held to represent waste products of plant metabolism, stored in the vegetable tissues because no mode of elimination is provided Others have looked on the glucosids as organic reserve materials devoted, like fats and carbohydrates, to the growth and development of the plants in which they occur In the case of the digitalis plant, *Digitalis purpurea,* active glucosids are found not only in the mature leaves but also in the seeds A recent investigation by Straub [1] in the pharmacologic institute at Freiburg in Baden has shown that the seed glucosids which include digitalinum verum (digitalin) and digitalein do not decrease in amount as do the fats when germination proceeds, hence they cannot be regarded as reserve products The glucosids pass into the leaves of the seedling without loss in quantity, on the other hand, the content of digitalis glucosids increases up to a certain stage This demonstrates conclusively that they are in fact essentially waste residues of the metabolism of the growing plant organism

ILLEGAL PRACTICE BY MEDICAL CULT PRACTITIONERS

Chiropractors and followers of other medical cults are doubtless practicing in many states in direct violation of the medical practice acts Chiropractors, especially, are aided and abetted in doing so through an organization known as the Universal Chiropractors' Association of Davenport, Iowa, which has as its officers some who are also closely identified with a chiropractic school in that city [2] Such illegal practice could doubtless be checked, if not totally done away with, if in more states such energetic action were taken against them as is now being conducted in Illinois by the Department of Registration and Education As referred to in our news columns this week,[3] temporary injunctions are being issued individually against all chiropractors in Illinois in an attempt to break the vicious circle established by the Universal Chiropractors' Association, which is encouraging a wholesale violation of law If those who desire to practice the art of healing are not willing to comply with such reasonable educational standards as will render the public safe from ignorance and incompetence, then they should not be granted legal authority to practice, nor should they be permitted to practice on the public illegally through the machinery they themselves have established to evade the penalty for so doing

The People a League of Health—There are public health laws galore but these form only the machinery which sets in motion the regulations under which the public health is controlled And, yet, machinery however much it can accomplish is still a soulless thing that is the defect of the machinery of the public health laws It is powerless to influence the personal voluntary assistance of those who benefit from it—*Medical Press and Circular* **109** 66 (Jan 28) 1920

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION, PUBLIC HEALTH, ETC.)

ARKANSAS

Health Train Starts—The health train of the state board of health commenced its tour of the Cotton Belt Lines at Piggott, June 7. The train is under the direction of the sanitary engineer of the Cotton Belt system, and Dr. Charles W. Garrison, state health officer.

Health Association Meeting—At the annual meeting of the Arkansas Public Health Association held in Little Rock, the following officers were elected: Dr. Augustus C. Shipp, president; Dr. Henry Thibault Scott and Mrs. H. C. King, Fort Smith, vice presidents; Mrs. C. L. Shafer, secretary, and Mr. T. S. Shannon, treasurer.

GEORGIA

County Adopts Health Law—By unanimous vote of the grand jury, May 26, the Ellis law was adopted in Walker County, this being the eighteenth county in the state to adopt the law.

College Commencement—At the eighty-ninth annual commencement exercises of the Medical College of Georgia, Augusta, held May 31, a class of fifteen seniors was graduated.

New State Officers—At the seventy-first annual session of the Medical Association of Georgia held in Macon May 5 to 7, the following officers were elected: president, Dr. Edward T. Coleman, Graymont; vice presidents, Drs. Theodore E. Oertel, Augusta, and Fred L. Webb, Macon; secretary-treasurer, Dr. Allen H. Bunce, Atlanta; delegates to the American Medical Association, Drs. Edward G. Jones and William C. Lyle, Atlanta, and alternates, Drs. Jarvis G. Dean, Dawson, and Mallie A. Clark, Macon.

ILLINOIS

Library Open to Physicians—The medical department of the University of Illinois through its dean, Albert C. Eycleshymer, extends a cordial invitation to members of the profession to make free use of its library on the ground floor of the college building at Congress and Honore streets, Chicago. It contains many standard works and subscribes to about 300 periodicals.

Rush Alumni Election—At the annual meeting of the Rush Medical College Alumni Association held in Chicago, June 16, Dr. Frank Billings presided as toastmaster and the following officers were elected: president, Dr. Wilbur E. Post, Chicago; vice presidents, Drs. J. J. Moore, Chicago, A. S. Barnes, Columbus, Ohio, and David Fiske, Chicago; necrologist, J. F. Waugh, Chicago; treasurer, Carl O. Rinder, Chicago, and secretary, Dr. Charles A. Parker, Chicago. Drs. E. L. Kenyon and Dean Lewis, Chicago, were made directors for three years. Dr. Morris Fishbein continues as editor of the alumni bulletin.

Chiropractors Enjoined—The department of registration and education reports that twenty-six more temporary injunctions have been issued against individual chiropractors who are practicing in Illinois without licenses. The injunctions restrain these individuals from paying assessments to the Universal Chiropractors' Association of Davenport, Iowa, and forbids them from accepting money from that association with which to pay fines, penalties and costs assessed against them by the Illinois courts. It also restrains them from accepting the services of attorneys of the association in defending cases brought against them in the Illinois courts. The result of the injunction is that each chiropractor must finance his own defense. The chiropractors enjoined are: Claude Griffith, Cave-In-Rock; Ollie D. Davidson and Mrs. Elizabeth Suverkrup, Champaign; Ethel B. Stump, G. E. Stump and Lillian B. Stump, Chenoa; S. M. Bernell, Leonard W. Miller, J. Charles Orr, W. C. Schulze and Harrison Atchley, Chicago; Mabel E. Gilpin, Chicago Heights; Anna M. King, East St. Louis; George F. Stewart, Elgin; B. F. Tucker, Galesburg; Rose Aulabaugh, Granite City; Josephine Olson, Greenville; Elnora Clawson, Industry; Louis O. West, Mascoutah; V. C. Wright, Mattoon; Berta Schraner, Rushville; L. E. Gates, Sparta; T. E. Hallbeck, West Salem; W. F. Prisk, Wilmette; E. L. Spencer, Blue Island, and Bessie Atherton, Peoria. Similar injunctions were previously issued against twenty-five chiropractors as reported in THE JOURNAL, May 22, and are still pending against about fifty other chiropractors in the state.

INDIANA

Brockway Found Guilty—Dr. Charles J. Brockway, Lafayette, accused of involuntary manslaughter in connection with the death of his wife, is said to have been found guilty by a jury on June 12. Congress of French-Speaking Alienists and Neurologists—The circular has been received announcing the XXIV *Congres des medecins alienistes et neurologistes de France* et des pays de langue française to be held at Strasbourg Aug 2-6 1920 The subjects appointed for discussion are hallucinations from dreams professional mental disease, and the lesions of the thyroid with exophthalmic goiter Prof E Dupre of Paris will preside and the secretary is Dr R Lalanne, medical director of the asylum at Mareville pres Nancy

Medical Conference at Geneva—At the first formal meeting of the medical advisory board of the League of Red Cross Societies which convenes at Geneva Switzerland July 5, the following countries will be represented United States, by Dr Simon Flexner, Belgium, by Professor Brodet, Denmark by Professor Madsen, France by Professors Roux and Albert Calmette and Dr Leon Bernard, Great Britain, by General Lyle Cummins Walter Fletcher and George Newman, Italy, by Professor Bastianelli and Dr Castellani, Japan by Dr Kinnosuke Miura, and South America, by Dr Chagas

Proposed Tribute to Italian Hygienist—Prof Luigi Pagliani of the chair of hygiene in the University of Turin reaches the age limit this year, and it is also the fiftieth anniversary of his professional career He was the pioneer in organizing the public health service in Italy, in directing legislation and in controlling and preventing epidemics A committee consisting of the incumbents of all the chairs of hygiene in the country has been formed to collect funds to found an annual prize, the Pagliani prize The treasurer of the fund is Prof Paolo Desderi, via Bidone 37, Turin

Monument to Belgian Biologist—Our Belgian exchanges describe the recent festivities in connection with unveiling the monument in honor of the late Professor van Beneden, at the entrance of the institute at Liege, the scene of his labors Van Beneden had to his credit a long list of works on zoology, histology and general biology and he was one of the two founders of the *Archives de biologie* in 1880 In the course of the speeches it was recalled that van Beneden never ventured to make positive statements in scientific matters but always qualified his announcements by the words It is eminently probable that "

Bulletin of the Belgian Department of Labor and Food Supply—The first number of a journal has been received to be issued quarterly by the minister of industry, labor and food supply of Belgium The inspector-general of the medical service of the department, Dr D Glibert, contributes an article on the influence of industrial noises, Dr G Galand on traumatism of the ear from explosions during labor, and others write on the painting of ships, syphilis in glass blowers the sanitary supervision of young industrial workers, and on first aid The bulletin is published at the Imprimerie medicale 34 rue Botanique, Brussels, the price of each number is 1 franc

Child Welfare Work—Coordination of all phases of child welfare work is being successfully carried out by the new Children's Bureau of Lower Austria The work for schoolchildren includes physical examinations and school medical inspection, physical training and vocational guidance During 1919, the bureau established thirteen homes, accommodating more than 3 000 children who were delicate or were recovering from an illness In addition to its work of promoting all measures pertaining to the welfare of children, the Children's Bureau of Lower Austria is charged with the enforcement of the law on the supervision of placed-out children, and the child labor law, both passed in 1919

New Journals on Heart and Blood—Italy has founded the *Haematologica, Archivio italiano di ematologia e sierologia,* to be a bulky volume of 500 pages with handsome colored plates The parts are issued irregularly The founders are Prof A Ferrata whose address is Cesare Battisti 53, Naples, and Prof C Moreschi of Parma The subscription to the volume is 55 francs A similar special journal has also been founded in Spain by a group of university professors, with Profs G Pittaluga and L Calandre of Madrid in charge, and F Jimenez Asua and J Planelles as secretarios de la redaccion It is issued bimonthly at an annual subscription of 24 pesetas The address of this *Archivos de cardiologia y hematologia* is Doña Blanca de Navarra 4 Madrid Two numbers have already been issued of each of these new journals

Celebration of Cortezo's Fiftieth Professional Anniversary—The director of the *Siglo Medico* of Madrid, Dr Carlos Maria Cortezo is a life senator of Spain and has served in the cabinet at different times The fiftieth anniversary of his entering on his professional career was celebrated May 30 with much ceremony, in the hall of the Academia de Medicina The minister of state conferred on him in the name of the king the collar of Carlos III, and the municipality notified him that the street on which he had been born had been renamed for him The first stone was also placed for the foundation of a monument to him in the Parque de Madrid for which his friends are collecting subscriptions An extra souvenir number of the *Siglo Médico* was issued on the occasion with more than sixty articles contributed This number is sold separately for 2 pesetas, the profits to be applied on the monument

Gift to London Hospital—The Rockefeller Foundation reports that approximately $6 000,000 has been appropriated for the University College Hospital Medical School of London This particular institution was selected because of the physical unity of the hospital and medical school buildings and the close relationship existing between the University College and its medical school The medical school has also recently organized what are referred to as full-time clinical units which combine research with the care of patients and with the teaching of students The foundation expresses its interest in the control and prevention of disease throughout the world and is aiding this medical school in London since it is cooperating with governments in many parts of the British Empire The building program, for which about $3,000,000 has been appropriated, calls for the enlargement of the hospital to a capacity of 500 beds and for the erection of a building for an institute of anatomy There will also be a new home for nurses, new quarters for resident physicians and a biochemical laboratory The rest of the appropriation will be used to meet the annual expenditures of the medical school

Deaths in the Profession in Other Countries

Dr T A Tage-Hansen, the leading surgeon of central Denmark where he maintained the Aarhus hospital in the front rank of such institutions aged 71——Dr J García of Tucuman, Argentina, subdirector of the Departamento Nacional de Higiene in which he had served for twenty-two years member of the state legislature died at Buenos Aires May 18——Dr Carlos Spada, Jr, of Buenos Aires author of a number of works reporting the results of biologic research, editor of the *Revista Sud-Americana de endocrinologia* of Buenos Aires of which he was one of the founders, aged 28——Dr T Alves of Campinas, Brazil, aged 63

Government Services

Hospital Discontinued

The Surgeon-General of the Army has arranged to discontinue U S General Hospital No 3 at Carlisle, Pa as a general hospital on June 30 He has been authorized to utilize the Carlisle barracks military reservation and the acreage adjoining the school as a Field Service School, Medical Department, U S Army"

Medical Officers Honored

Rear Admiral Robert M Kennedy M C, U S Navy was the commencement orator at the graduating exercises of the Detroit Medical College June 18, and chose as his subject 'The Necessity for Post-Graduate Study"——Col Joseph M Heller M C, U S Army, was elected surgeon general of the Military Order of Foreign Wars of the United States at its nineteenth triennial convention held in New York, May 20

Distinguished Service Cross Awarded

The distinguished service cross has been awarded to Major Paul F Brown, Minneapolis Medical Detachment 361st Infantry, "For extraordinary heroism in action near Eclisfontaine, France on the nights of Sept 26 and 27, 1918 Major Brown, then captain voluntarily advanced in front of our lines for the purpose of rescuing the wounded left in advance of the new lines by the retirement of a unit of the regiment Due to his efforts fourteen wounded Americans were brought safely back to our lines"

Health Conditions of the Army

Admission and noneffective rates for the week ending June 18 show a slight increase over the preceding week but are still unusually low There were twelve new cases of malaria reported from the Southern Department during the week, eight new cases reported from Camp Dodge, four from Camp Pike and four from the Western Department Two admissions for pneumonia were reported from Camp Taylor two from the Eastern Department and one each from Camp Gordon, Camp Upton, Fort McDowell and the Southern Department Two cases of diphtheria were reported from Camp Taylor The death rate for disease is 2 2 per thousand as compared with 3 1 last week There were seven deaths from disease, one of which was due to tuberculosis and two to pneumonia Health conditions among the American forces in Germany continue excellent The following cases of communicable diseases were reported influenza, five, pneumonia, four, scarlet fever two mumps, two, impetigo, three, chickenpox, one, and scabies fifteen

Public Health Service Investigates Plague

Surgeon-General Hugh Cumming of the Public Health Service is in Pensacola, Fla, investigating the bubonic plague cases which have recently been found in that city The prevalence of the plague at Vera Cruz, Tampico and New Orleans, while not a subject for alarm is receiving practical attention at the hands of the Public Health Service At New Orleans sixteen cases have appeared since 1909—the last one June 15 At Pensacola one suspicious and three positive cases have appeared at Galveston there are two positive cases The Public Health Service has started a campaign in the southern seacoast cities against the rat menace with a view of eliminating any further spread of the plague by rodents Senior Surgeon G M Guyteras at Key West Fla has begun a rat survey in that vicinity, and at Pensacola the Public Health Service has a force of trappers and over 1,000 traps at work.

At the same time the Public Health Service is reviewing its activities to eliminate rodents and has sent letters to Public Health officers of all states urging that local officials boards of trade and municipal organizations engage in continuous efforts to exterminate rats for sanitary reasons

Applicants for Positions in Medical Corps

Considerable disappointment exists in the War Department because of the fact that only 1 300 applications have been received for the examination for the appointment of officers in the Medical Department of the Army This examination is being conducted by the War Department under the Army Reorganization Act of Congress passed at the recent session and is intended to fill approximately 1 000 vacancies in the commissioned medical personnel of the Army This act of congress permits medical officers who served in the war to be appointed in the Regular Army and a special examination scheduled to be held July 7, 1920, is open only to physicians who were in the war

On account of the fact that only a comparatively small number of applications have been received it is the opinion of War Department officials that an additional call for applicants will be necessary to fill the vacancies that will be caused by the Army Reorganization Act No official information is available at the present time as to what method will be employed to secure additional medical officers It is quite certain, however that not more than 50 per cent of the 1 300 applicants will qualify physically and professionally for army service

Professor Calmette's Work on Tuberculosis

Anent the inauguration of the Pasteur Institute of Greece at Athens, THE JOURNAL (May 15, 1920 p 1411) mentioned the important work of Professor Calmette and his appointment as assistant director of the Pasteur Institute of Paris At a recent session of the Academy of Medicine, Dr Calmette presented a copy of his book "L'infection bacillaire et la tuberculose chez l homme et chez les animaux," recently published He found time to write this work during his isolation in Lille under German occupation, when he was possessed of a desire to contribute with all his might toward offsetting, by a better organized campaign against tuberculosis, the frightful loss of young lives which the World War exacted from France and the allied nations

Calmette characterized his book in the following words "I have set forth as clearly as I could my own researches on the pathogenesis of tuberculosis infection, on tuberculin reactions antibodies and immunity against tuberculosis But I have endeavored above all to set off as conspicuously as is merited the achievements of French British and American investigators very often ignored by German science Those who will read my work carefully will find I hope, that as concerns the latter I have shown the most rigorous impartiality" To the applause of members of the academy, the president congratulated Dr Calmette on his successful completion of so important a work despite the severe physical and mental strain endured during the occupation of Lille.

Civil Responsibility and Surgery

Two recent decisions of the court of appeals are particularly interesting because they show different aspects under which civil responsibility can be attributed to physicians or dentists The law of Nov 30 1892, governing the practice of medicine is silent on the subject [illegible] physicians surgeons and dentists therefore based on the general held responsible for the dama[illegible]

acts, but also through negligence and imprudence? In other words, whenever a mistake has occurred, responsibility is held to exist Now, as regards medicine, the courts have been very careful, for fear of trammeling initiative and paralyzing the progress of medical science For this reason it is admitted that if the interest of a patient requires it, the physician may, without incurring responsibility, apply a dangerous form of treatment He may employ an untried method, if he sees that there is no chance of success with the reputed and usual treatment but he must not employ a method or perform an operation the dangers of which are not justified by the gravity of the illness This was the basis of a decision by the court in a case of a young girl who was treated by roentgen rays for a slight growth of hair on the chin The court ruled that the physician committed a fault by the employment of a treatment the dangers of which were out of proportion with the end to be attained, since he was not treating a disease but only attempting to remove or hide a simple physical imperfection The physician should have refused to cooperate, by not doing so he incurred responsibility and as a result he was held liable for damages In another case there was a surgical mistake A dentist in attempting to remove a tooth root injured the maxilla The dentist alleged, it is true that the subsequent necrosis was due to the diseased condition of the patient The medical expert did not agree with this but held that there was evidence of a serious mistake on the part of the dentist

Industrial Strikes and the Public Health

Staff physicians and surgeons of the hospitals of Bordeaux have announced in the daily papers that because of a strike electric light and current have been wanting for most of their important services and it was therefore impossible to examine, operate on and nurse a large number of patients On the other hand, the pressure of gas has been too low for sterilizing water, instruments and dressings Under these conditions, many physicians and surgeons, despite their good intentions, are unable to continue their hospital service

LONDON

(From Our Regular Correspondent)

June 5, 1920

Statistics of the Medical Profession

In his address to the General Council of Medical Education, the president, Sir Donald MacAlister, said that on the home list in the new Medical Register only 872 physicians were registered in 1919, but no fewer than 450 were registered in the colonial and foreign lists The result was that the total number (1 322) of new names was higher than in any years since 1915 The proportion of women physicians was increasing and was likely to increase rapidly during the next year or two Their services were in less demand than during the war and newly qualified women were finding difficulty in obtaining suitable opportunities for professional work The profession of medicine was, in regard to women, affected like other occupations by the return to civil life of large numbers of ex-service men as students and physicians To those men the country owed special consideration, and they ought to receive it But inevitably they tended to displace a proportion of the women who so capably carried on the work of the profession during their absence abroad The Medical Students' Register indicated that the depletion of their professional ranks by the wastage of the war would in a few years be much more than made good by the addition of newly qualified men No fewer than 3 420 medical students (men and women) were registered in 1919, as compared with 1 600 in 1914 The number of registrations, indeed exceeded by more than 1,000 the highest previously recorded—namely, in 1891—when for special reasons the number rose to 2,405 This sudden increase could not at once be met by a corresponding expansion of their educational resources, and the strain thrown on the medical schools of the country was therefore for the time excessive In the departments of anatomy and operative surgery, of midwifery, and of clinical medicine, the existing provision was no longer fully adequate to the new demands The Dentists' Registry was stationary, but there was an assured prospect of an advance by the end of 1922, for the number of dental students entered in 1919 had risen to 612, as compared with 204 in 1914

A Tax on Physicians

South Africa stands alone in the British dominions in taxing the practice of medicine Physicians have to pay a tax of $50 a year, and dentists $75 for a license to practice in the Cape Province but in the Orange Free state physicians pay $75 Other professions—lawyers accountants, auditors, architects—are also taxed In the Cape provincial council a struggle was made in favor of young impecunious lawyers being exempt, but nothing was said for physicians One rural member rejoiced at physicians and lawyers being taxed, regarding both as parasites from which the state would be well rid

Censorship of Advertisements in the Medical Press

At a meeting of the Worcester County Council, a curious situation was disclosed In connection with a medical tuberculosis and school inspection scheme for the county, advertisements for ten physicians at salaries of $2 250 had been published Two were obtained, and it was proposed to repeat the advertisements, but when they were sent to the *Lancet* and the *British Medical Journal,* replies were received stating that advertisements could not be received which offered less than $2 500 for such posts A letter was also received from the ministry of health stating that tuberculosis officers should have special qualifications and experience, and doubting whether the salaries offered were sufficient The chairman of the council said that he objected to this sort of pressure being brought to bear on local authorities They had already got two gentlemen for $2 250 very suitable for the posts He felt averse to allowing the medical press to dictate what salaries they should give By a majority of votes it was decided to advertise for the officer in the daily press

Protection for the Medical Officers of Venereal Clinics

A deputation from the London and Counties Medical Protection Association waited on Dr Addison, minister of health, to urge the necessity for legislation to protect the medical officers of venereal clinics from being compelled in the witness box to violate the established principles of professional secrecy and to give information of the nature of their patients' ailments and of anything else that came to their knowledge in their professional capacity These medical officers are compelled under penalty of imprisonment to reveal what their patients communicate to them believing it to be absolutely confidential It was urged that the effect would be disastrous to the working of the clinics and militate against the efforts being made to cure and eliminate venereal disease Dr Addison expressed agreement with the views of the deputation and promised to do what he could to promote the legislation desired He felt sure that public opinion would support the maintenance of professional secrecy in connection with venereal clinics As has been pointed out before in THE JOURNAL, the law does not respect professional secrets in this country, and objections as strong as were urged by the deputation can be made against the legal position in general

A Bill for the Blind

In the House of Commons, Dr Addison moved the second reading of a bill to increase preventive services against blindness, against ophthalmia neonatorum in particular, to provide facilities for blind persons learning some trade, and to enable local authorities to provide and maintain or to contribute toward the provision and maintenance of workshops, hostels, homes and other places for the reception of the blind The bill also provides that persons so blind as to be unable to perform any work, and who are 50 years of age shall be entitled to receive the pension to which in ordinary circumstances they would be entitled only on attaining the age of 70

Report of the National Birth Rate Commission

The National Birth Rate Commission was instituted in 1913 by the National Council of Public Morals It issued its first report in 1916 (which was noticed in THE JOURNAL), discussing the causes and effects of the declining birth rate It has now issued a second report In a preliminary chapter the commission discusses the fall in the birth rate during the war years, the reduction amounting by 1918 to 26 per cent In the period 1915-1918 the loss of births attributable to the war was 543,000 Passing to what they term one of the most important causes of the decline in the birth rate, namely, voluntary restriction, the commission states that at present the decline of the birth rate is greater where the quality of the children might be expected to be better The child bearing is at present relatively the greatest among families and in homes in which the economic and social conditions do not allow of the healthy and proper upbringing of so many children The reduction is taking place in the average size of the families in always greater degree in those classes in which the condition for the welfare and education of the children is the best This disproportion in relative birth rates is an ominous sign for the future of the nation and the empire While there is wisdom in the purpose not to incur responsibilities which cannot be met, it may easily pass into a timidity which shrinks from what might prove a sacrifice good for the character and bringing joy of heart Comfort and ease not to mention luxury, are not necessarily the best conditions for the personal development of either parents or children The refusal to accept the burden of parenthood on unworthy grounds is not only often an evidence of selfishness, but if it becomes general, will have as its consequence a slacking of the moral fibers of the nation The responsibility of the country to parents in the discharge of their obligations must equally be asserted If the community desires an adequate number of children of good quality, it must be prepared to see that the burdens which weigh too heavily on many parents are relieved Among the reforms that have been proposed are proper housing a living wage, training for and care of motherhood and infancy, facilities for education and relief from taxation proportionate to the responsibilities involved The need for a properly regulated redistribution of the population with special regard to the due proportion of the sexes in the empire is considered one of the most important methods of relieving the burden of parenthood in large families Various schemes for the endowment of motherhood were considered but having regard to the economic and other difficulties of the question the commission does not recommend any of them It would, however, regard with sympathy any plan by which a reasonable provision, similar to that made for the widows of sailors and soldiers, would be made for widows of men in civil employment who are left with young children and even for the wives in like circumstances whose husbands are incapacitated With regard to the problem of illegitimacy, the commission finds that, although the decline in legitimate births has alarmed the country, and the illegitimate child has come to be regarded as helping to make up for the deficiency of births in wedlock there is no evidence that public opinion has as a whole undergone any fundamental change of attitude toward the unmarried mother nor are there any signs of such a change Statistics for 1918 show that illegitimate births have increased by 11 6 per cent, while legitimate births have decreased by 1 6 per cent As a result of these changes (which are due to the war) the proportion of illegitimate to total births which fell to a minimum or 3 95 per cent in 1901-1905 has now risen to 6 26 per cent the highest ratio reached during the last fifty years There is urgent need for (*a*) more accommodation for the unmarried mother and her child, and (*b*) more efficient guardianship of the illegitimate child It is recommended that carefully supervised hostels should be set up in which mothers can care for their children and at the same time learn a trade, or become efficient in domestic work. The emotions of growing boys and girls should be trained and guided by parents and competent teachers in order to avoid and counteract the general ignorance and that half knowledge which is even more dangerous Great issues for the nation and the empire are involved in the steady decline of the birth rate In the event of a war similar to that which we have just experienced, what would happen to us with a greatly reduced birth rate? As it is, the position is most disquieting for the indications are that in the homeland the population may not continue to increase, while in the dominions oversea, without the aid of immigration, it will not at the present rate increase greatly, at least from additions of the British stock All these enormous lands, with their countless native races we hold with under 60 000 000 of white people of whom 45,000,000 dwell in these little islands But unless we add to our numbers, for how long shall we be able to fulfil our obligations in the face of recent developments of race ambitions? Extensive settlements on the land would mitigate the evil, but modern men and women will not settle in numbers on the land As our own experience and that of Australia show, they prefer the city and the cinema The commission holds that intra-imperial migration would tend to remove many of the dangers and injuries to the race which depend on extreme urbanization, and the reliance on imported food and in the interests of racial morals they urge the imperial government, in conjunction with the dominions, to direct itself to the problem Intra-imperial migration in its view, should be regarded as a matter of imperial health and safety, and should be controlled accordingly

Marriages

CHARLES TEACKLE CARTER BUCKNER Capt, M C U S Army Fort Sill Okla to Miss Mildred Alston Lee, at Montgomery, Ala June 17

HERMAN GAILEY Baltimore, to Miss Mary Elizabeth McConkey, at McClellan Heights York, Pa June 17

JOHN W HANNER, Col M C U S Army to Miss Gertrude Kersey Jones at San Francisco, April 22

ARTHUR TREW BLACHLY Portland Ore to Miss Mary Elizabeth Cole of Forest Grove, Ore May 29

HERBERT WARREN CANFIELD Baxter Iowa to Mrs Matie L Hager, at Des Moines, Iowa June 16

JACOB FRANK HENKEN Racine Wis to Miss Ethel Christine Roose of Sycamore Ill, June 12

GEORGE ANASTASIOU PETRULIAS to Miss Edith J Blum both of Bethlehem Pa June 4

TRIMBLE CLARENCE JOHNSON to Miss Alice Anderson both of Atlanta, Ga June 22

HOWARD SCULL BRANIN to Miss Mal
Millville N J June 16

Deaths

Albert Henry Gieschner, Tacoma, Wash., University of Maryland, Baltimore, 1901, aged 44, first assistant surgeon to the Northern Pacific Railway Hospital, Tacoma, who served before the United States entered the World War in German field hospitals and also in Bulgaria and Constantinople, died, June 9, in the Northern Pacific Railway Hospital, Tacoma, from complications following an operation for appendicitis several weeks before

Karl August Gunnar Sundstrom, Chattanooga, Tenn., Chattanooga Medical College 1908, aged 35, lieutenant-colonel (emergency) M. C. U. S. Army, a member of the Tennessee State Medical Association, who was undergoing reconstruction at the United States General Hospital, Oteen, N. C., died in that institution, June 1

Harold James Morgan ⊕ Toledo Ohio, College of Physicians in the City of New York, 1895, aged 47, professor of pediatrics in Toledo Medical College, for seven years director of the children's department of the Maternity Hospital, captain, M. C., U. S. Army, and discharged Dec. 24, 1919, died in Cleveland, June 7

William Thomas Stephenson, Kirksville Mo., St. Louis College of Physicians and Surgeons 1892, aged 62 postmaster at Browning Mo. under the Cleveland administration and later a druggist of Kirksville, for two years owner and publisher of the Kirksville *Democrat*, died, May 27 from cerebral hemorrhage

William C. Crutcher, Mt. Vernon, Texas, University of Louisville, Ky., 1883 aged 59, a member of the State Medical Association of Texas once president of the Northeast Texas Medical Association, local surgeon of the Cotton Belt system, founder of the Crutcher Sanitarium, died June 2, from pneumonia

Joseph A. Jennings ⊕ Pittston, Pa., Jefferson Medical College 1896, aged 46, also a graduate in pharmacy, a member of the staff of the Pittston Hospital, for three years physician for the Pittston Poor Board and for five years a member and secretary of the city school board, died at White Haven, Pa., June 5

Admiral L. R. Avant, Savannah Ga., Atlanta (Ga.) Medical College 1893, aged 63, a member of the Medical Association of Georgia, a member of the staff of Parkview Sanitarium, city physician of Savannah, also an ordained minister, and a pharmacist, died June 7, from uremia

Charles Jordan, Wakefield Mass., Dartmouth Medical School Hanover N. H. 1859, aged 91, a member of the Massachusetts Medical Society, and for sixty-one years a member and once president of the Middlesex East District Medical Society, died June 6, from senile debility

Thomas Wilson Lambert, London England, University of Cambridge England 1889, L.R.C.P. (Lond.), and M.R.C.S. (Eng.), 1890, for many years a practitioner of Kamloops B. C. and medical officer in charge of the western section of the Canadian Pacific system, died April 10

Robert L. Ashbrook ⊕ Washington Pa., College of Physicians and Surgeons Baltimore 1886, aged 56, died June 6, from the effects of a gunshot wound of the head self-inflicted it is believed, with suicidal intent while despondent on account of ill health

George Gile Kerns, Leola, S. D., Sioux City (Iowa) College of Medicine 1906, aged 38, a member of the South Dakota State Medical Association, died in Aberdeen, April 19, from the effects of the accidental swallowing of a pin, six months before

John Hamilton Ellis, New Orleans, Tulane University of Louisiana New Orleans, 1888 aged 54 a member of the Louisiana State Medical Association, and state registrar of vital statistics in the state board of health, died, June 2, from uremia

Daniel Edwin Stone, Jr ⊕ Emmitsburg Md., University of Maryland Baltimore, 1900 aged 44 lieutenant, M. C., U. S. Army and on duty at Camp Green N. C., died in the Frederick City (Md.) Hospital, June 13, after an operation for appendicitis

James P. Lynch, Chicago, Bennett College of Eclectic Medicine and Surgery Chicago, 1883, aged 63 a member of the Illinois State Medical Society, died, June 26, from septicemia following an infected wound of the finger

Frederick Adryan Hoyer, Paducah, Ky., Hospital College of Medicine, Louisville Ky., 1902, aged 47, a member of the Kentucky State Medical Association, captain, M. C., U. S. Army, and discharged November, 1918, died, June 3, from meningitis

Thomas E. Lucas, Chesterfield S. C., Medical College of the State of South Carolina Charleston 1859, aged 84, major of the Eighth South Carolina Infantry, C. S. Army, during the Civil War, died June 12, from heart disease

William J. Conner, Labette Kan., Cincinnati College of Physicians and Surgeons 1862, aged 84 once state senator, for fifty-three years a practitioner of Kansas, died at the home of his daughter in Parsons Kan. June 1

Joseph G. Crawford, Hahnemann Medical College of the Pacific San Francisco, 1892, aged 80, a director of the Sawtelle Chamber of Commerce, surgeon of U. S. Volunteers during the Civil War, died, June 4

Harry LaRue, Dexter, Mo., University of Louisville, Ky., 1897, aged 52, a member of the Missouri State Medical Association local surgeon of the Iron Mountain system, died, May 27, from cerebral hemorrhage

Henry Weil, New York, Medico-Chirurgical College of Philadelphia 1897, aged 45 a member of the Medical Society of the State of New York, died at his summer home at Harmon-on-the-Hudson May 30

Maria Louise De Pew Crothers, Bloomington Ill. Woman's Medical College of Pennsylvania, Philadelphia 1883, aged 86 for four years in charge of the Girls Industrial Home of Bloomington, died May 31

Edward Parmer Partlow, Constantine Mich., Detroit College of Medicine and Surgery 1894, aged 59, a member of the Michigan State Medical Society, health officer of Constantine, died about June 4

Charles Carpenter Valle, San Diego Calif., Washington University St. Louis 1879, aged 70, at one time an officer of the United States Public Health Service at Tia Juana, Mexico, died June 5

Aloysius Peter Renneker, Cincinnati Medical College of Ohio Cincinnati, 1879, aged 65, a member of the Ohio State Medical Association, died at the home of his son in Cincinnati, June 4

John Harris Werner ⊕ Chicago, Chicago College of Medicine and Surgery 1911, aged 46, died June 21 from septicemia following a wound received while performing an operation

Charles Pitt Holmes, Fort Gaines Ga., Atlanta (Ga.) Medical College 1891, aged 59, a member of the Medical Association of Georgia, died in his office May 31, from acute gastritis

David D. Smith, Philadelphia, Jefferson Medical College, 1878, aged 80, formerly dean of the faculty of the Philadelphia Dental College, a veteran of the Civil War, died, June 4

Rafael Garcia de Quevedo, San Juan Porto Rico, University of Maryland Baltimore 1920, aged 24, was accidentally drowned in the Severn River, near Severn Side Md. June 7

Morris Franklin Coglan, Hamilton Ont., Queens University, Kingston, Ont. 1916 aged 40, died in the City Hospital, Hamilton February 20 from pneumonia following influenza

James Conquest Cross Barker, New Milford, Conn., Yale Medical School, New Haven, Conn. 1879, aged 68, died, June 16 from a ruptured aneurysm of the abdominal aorta

John G. Thomas, Monticello Iowa, University of Wurtzburg Germany, 1878, aged 69, a member of the Iowa State Medical Society, died, June 11, from cerebral hemorrhage

William M. Mason, Hazel Ky., University of Louisville, Ky. 1875, aged 78 at one time president of the West Tennessee Medical Society, died, June 7, from heart disease

Joseph Patrick Guinan ⊕ Lima N. Y., Georgetown University, Washington, D. C., 1908 aged 38, health physician and registrar of vital statistics of Lima, died May 31

George Boardman Cornell, Brooklyn University of the City of New York 1864, New York Homeopathic Medical College, New York City 1871, aged 87, died June 17

Christian Schneider, Cross Village, Mich. (license, Michigan 1902), aged 74, a member of the Michigan State Medical Society, a practitioner since 1865, died, March 29

Robert Jenkins Henry, Glyndon Md. University of Maryland Baltimore, 1866, aged 74, died, June 7, from paralysis

Abraham J. Keightley, Louisville University of Louisville, Ky., 1867, aged 73 died in Louisville City Hospital, June 7

⊕ Indicates Fellow of the American Medical Association

George Campbell, Detroit, Detroit College of Medicine and Surgery, 1887, aged 60, a member of the Michigan State Medical Society, died in Pasadena, Calif, April 16

Charles MacLachlan, Elwell Mich, Eclectic Medical College of Maine, Lewiston 1882, aged 74, a member of the Michigan State Medical Society, died, March 17

William Franklin Harper ⊕ Mt Vernon, N Y, Cincinnati College of Medicine and Surgery, 1879, aged 65, was killed, June 16, in a railway accident, near Rene, Colo

William Edwin Baker, Duncanville Texas, University of Tennessee, Nashville 1882, aged 62, a member of the State Medical Association of Texas, died May 29

Rufus Edwin Donnell, Gardiner Me, Dartmouth Medical School Hanover N H, 1889, aged 61, a member of the Maine Medical Association, died, May 23

Louis Francis Smiley, Philadelphia, Hahnemann Medical College, Philadelphia 1875, aged 69, died at the home of his brother in Chambersburg, Pa, June 12

Herbert Tetlow, Westerly, R I, Western Reserve University, Cleveland, 1899, aged 49, was found dead in his apartments from a gunshot wound, June 11

Frederick R Greene, Albany, N Y, Albany (N Y) Medical College, 1884, a member of the Medical Society of the State of New York, died, June 6

Christopher Eugene Lett, Emporia, Kan, Washburn College Medical Department, Topeka, Kan, 1909, aged 54, died, April 7, from cerebral hemorrhage

William Henry Falls ⊕ Cleveland, Miami Medical College, Cincinnati 1873, aged 70, for thirty-five years a practitioner of Cincinnati, died, June 7

George Washington Fisher, Laporte City, Iowa, Chicago Homeopathic Medical College, 1877, aged 65, died, June 1, from cerebral hemorrhage

John W Potts, Lacon, Ill, Eclectic Medical Institute, Cincinnati 1871, aged 75, a veteran of the Civil War, died, June 13, from myocarditis

Frank M Owens, Remmel, Ark (license nongraduate, Arkansas, 1903), aged 45, died in Amagon, Ark, March 25, from cerebral hemorrhage

John Moffet, Philadelphia, Jefferson Medical College, 1892, aged 54, also a graduate in pharmacy, died suddenly at Audubon, N J, May 30

Guy Lawton Bush, Atlanta Ga, Atlanta (Ga) College of Physicians and Surgeons, 1908, aged 36, died in a sanatorium in Atlanta, June 7

Edward Lanning Sheldon, Tacoma, Wash, Medical College of Eclectic Medicine and Surgery, Chicago, 1873, aged 74, died, May 31

Leslie J Foley, Montreal, Que, University of Bishop College, Montreal 1880, M R C S, L R C P (Eng), 1881, aged 60, died, April 9

Treby William Lyon ⊕ New Haven, Conn, Yale University New Haven, 1903, aged 39, a specialist in proctology, died, June 14

Horace Griswold Pease, Tacoma, Wash, a practitioner since 1855, aged 95, died April 27, from chronic interstitial nephritis

William Watson Wetherla ⊕ Chicago, Chicago Medical Society, 1885, aged 71, died, June 2, from cerebral hemorrhage

Charles E Barmm, Indianapolis, Eclectic College of Physicians and Surgeons, Indianapolis, 1893, aged 59, died, June 11

William J McNair, Quitman Miss, University of Alabama, Mobile, 1885, aged 73, died in a hospital in Quitman, June 7

Oscar H Fischer, St Louis, Washington University, St Louis, 1899, aged 44 died, June 14, from cerebral hemorrhage

Charles Stuart Wall, Wakeeney, Kan (license, Kansas, 1901), aged 68, died, April 13 from valvular heart disease

Julia Virginia Downes, Washington D C, Southern Homeopathic Medical College, 1895, died, about June 9

William Willard Armstrong, New York City, Bellevue Hospital Medical College, 1897, aged 53, died June 9

W R O Veal, Martel Fla, a practitioner for fifty years, aged 80, died, March 10, from acute cystitis

Xavier Bichat Haynie, Gallatin, Tenn University of Nashville, Tenn, 1873, aged 72, died June 11

The Propaganda for Reform

IN THIS DEPARTMENT APPEAR REPORTS OF THE JOURNAL'S BUREAU OF INVESTIGATION, OF THE COUNCIL ON PHARMACY AND CHEMISTRY AND OF THE ASSOCIATION LABORATORY, TOGETHER WITH OTHER MATTER TENDING TO AID INTELLIGENT PRESCRIBING AND TO OPPOSE FRAUD ON THE PUBLIC AND ON THE PROFESSION

THE LOWENTHAL POSTGRADUATE COURSE

Which Tells How to Make Diagnoses Accurately, Scientifically Check the Christian Scientists and Increase Your Earning Power

During the past year THE JOURNAL has received letters from physicians in various cities asking for information regarding the Post Graduate Course of Lectures and Clinics on Nervous and Mental Diseases' which was going to be given in their respective cities by Dr Albert A Lowenthal of Chicago The following inquiries are typical

To the Editor—Please note the enclosed letter from the American Organotherapy Company which appears to be conducted by Lowenthal The proposition of conducting these clinics impresses me as a piece of colossal gall which is amazing even in these days Do you know any thing about this matter?

To the Editor—Who the dickens is Albert A Lowenthal M D? Note the circular enclosed I have blue circled the remarks he evidently thinks will attract

In May, 1919 Chicago physicians received a form-letter signed and on the stationery of Albert A Lowenthal notifying them that Dr Lowenthal was about to 'give a Post Graduate Course of Lectures and Clinics on nervous and mental diseases" in the "Banquet Hall Morrison Hotel" Enclosed was a 'Programme and Reservation Card" and a self addressed envelope for physicians to notify Dr Lowenthal that they would be present In addition to showing physicians how to make diagnoses accurately" Dr Lowenthal offered to "explain fully how to scientifically check the Christian Scientists and increase your earning power!" And all for nothing!

At later dates similar letters were received by physicians in other cities, on the stationery of the "American Organotherapy Company, Room 902 31 North State St Chicago" Dr Lowenthal whose Chicago office is Room 901, 31 North State St is apparently president treasurer and practical owner of this company Enclosed with each of these letters—which offered the same inducements, free—was an envelope addressed to Albert A Lowenthal in care of the hotel at which Dr Lowenthal would stay while in that city There was also a 'Programme and Reservation Card' as in the case of the letters sent to Chicago physicians

According to our records, Dr Albert A Lowenthal was born in Chicago in 1874 and was graduated by the College of Physicians and Surgeons, Chicago, in 1895, receiving his license the same year

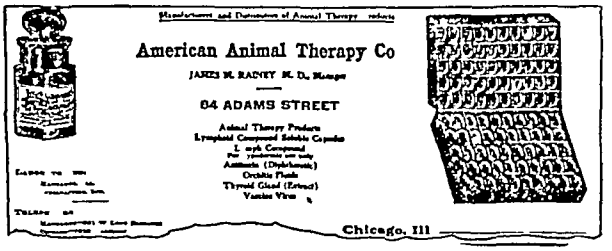
In a leaflet issued some time ago by Albert A Lowenthal, M D, 'for the sole purpose of enlightening Prospective Patients in regard to the therapeutic value of the Organo Therapy Treatment for Nervous Diseases," we learn that Dr Lowenthal is, or was

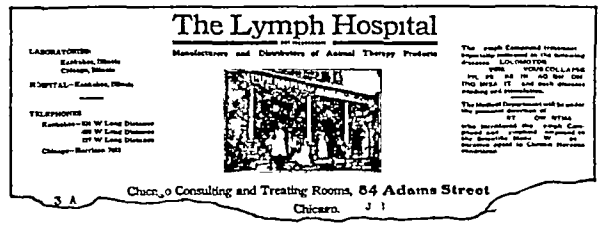
Professor Nervous and Mental Diseases Chicago Hospital College of Medicine
Formerly Professor Nervous and Mental Diseases Dearborn Medical College Jenner Medical College
Adjunct Profes or on Neurology and Psychiatry, University of Illinois College of Medicine
Formerly Physician Illinois Eastern Hospital for the Insane'
Formerly Supt Riverview Hospital for Nervous Diseases Kankakee Ill
Formerly on Advisory and Associated Attending Staff Cook County Hospital

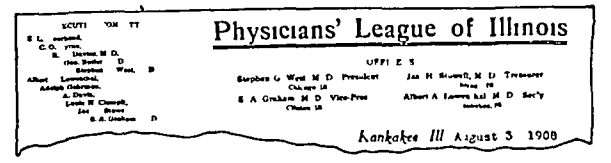
In Polk's Medical Directory for 1904 Dr Albert A Lowenthal's name appeared under Chicago, at 910 912 Chicago Opera House Building He was described as Superintendent of Lowenthal's Sanitarium In the same issue of the directory there was a display advertisement of the Lowenthal Sanitarium which while located at Kankakee Ill had its main offices' at 912 Chicago Opera House Bldg, Chicago

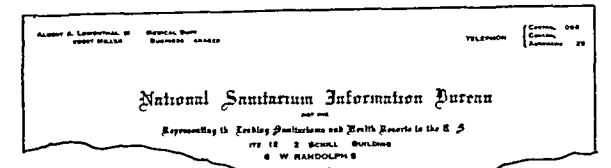
he advertisement was headed "GOAT LYMPH TREAT-IENT," and read in part

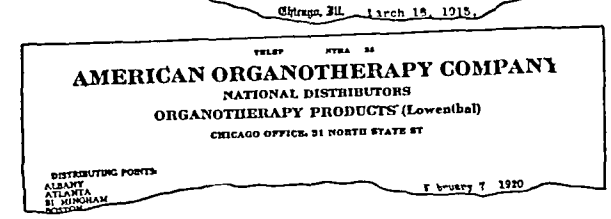
"Goat Lymph has revolutionized medicine and has been adopted by e scientific medical world as the only therapeutical agent that will solutely bring about positive results in chronic conditions such as eurasthenia Nervous Collapse Paralysis Locomotor Ataxia Brain ag Oncoming Insanity Chronic Stomach Disorders in fact such dis ises needing cell stimulation'











Some letterheads (greatly reduced) of concerns in which Dr Albert A Lowenthal has been interested

It mentioned further that Dr Albert Lowenthal "introduced Goat Lymph to the medical world as a curative agent

A few years ago a Chicago concern, known as the "American Animal Therapy Co," put out such products as 'Lymphoid Compound (Lowenthal)" 'Ova Mammoid (Lowenthal)," "Prostoid (Lowenthal),' etc The American Animal Therapy Co had for its manager James M Rainey Rainey also operated the 'Rainey Medicine Co ' a mail-order patent medicine" concern that sold "Vitaline" a "general debility cure The Rainey 'Vitaline' quackery was exposed in THE JOURNAL Oct 1 1910 and the matter appears in Nostrums and Quackery"

When the American Animal Therapy Company was operating from 84 Adams St Chicago, it claimed to have a hospital and laboratory at Kankakee At the same time letters were being sent out on the stationery of 'The Lymph Hospital" signed Albert A Lowenthal M D Although this 'hospital' was at Kankakee Ill, the address on the stationery was 84 Adams St, Chicago, and its telephone number was that of the American Animal Therapy Company According to the stationery, the 'Medical Department of the Lymph Hospital was "under the personal direction of Dr Albert A Lowenthal who introduced the Lymph Compound and Lymphoid Compound to the Scientific Medical World as a curative agent in Chronic Nervous conditions" A layman received a letter from the "Lymph Hospital" urging him to take "Lymphoid Compound" Later he received a "follow-up' letter, from which the following extracts are made Capitals used as in the original

Do you know that the doctors of this country are using the LYMPHOID COMPOUND EXCLUSIVELY in all cases where the nervous system is greatly involved with the most MARVELOUS RESULTS ISN'T THAT SUFFICIENT PROOF as to the merit of the remedy?

Nobody can tell you there is something just as good because THERE IS NOTHING JUST AS GOOD AS THE LYMPH — in fact IT IS THE ONLY THING THAT CAN BE DEPENDED UPO

Our Dr Lowenthal gives his personal attention to all cases at the Hospital and devotes a portion of his time advising by mail those persons under treatment who are unable to come to the Hospital He is a man of WORLD WIDE REPUTATION IN TREATING NERVOUS DISEASES — HIS ADVICE ON CASES LIKE YOURS IS WORTH EVERYTHING TO YOU

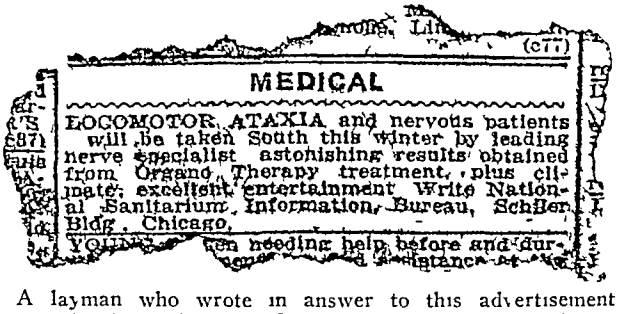
Think this over and if you do you will write an order today for the Lymphoid Compound The home treatment costs $9 50 for thirty three days—think of that You have our physician's advice and care free of charge — could anybody offer more to you?

In 1908 Dr Lowenthal appeared as a witness for Edward R Hibbard who was being prosecuted by the federal authorities Hibbard operated a "men's specialist office in Chicago, it had two entrances and a different name for each entrance—the "Boston Medical Institute" and the "Bellevue Medical Institute" Hibbard was found guilty of fraud in the operation of this concern and was fined $1,500 The transcript of the testimony in the Hibbard case records that Dr Albert A Lowenthal when on the stand claimed to "have treated as many nerve patients as any nerve specialist in Chicago" He further declared, according to the transcript, that physicians who make a specialty of nervous diseases "mature in about ten years" and that after that time most of them become nervous wrecks or insane This was in 1908 In this connection it is worth noting that in letters sent out by Lowenthal in May, 1919 he claimed

In the past twenty five years I have limited my work to neurological and psychological cases

In 1908 also, Dr Lowenthal was sending out letters to Illinois physicians in his capacity as Secretary of the "Physicians' League of Illinois" The 'league' issued a 'report on candidates for governor and members of legislature" giving the names of the various political candidates for office whom 'the members of the league can safely support" There were no "membership' fees and a physician who wrote asking 'who foots the bills" received no reply

In 1915 Albert A Lowenthal, whose "valuable discoveries in the domains of Organo Therapy, Neurology and Pediatrics, have given him an international reputation as a Neurologist Alienist and Climatological Expert of high standing' was Medical Superintendent of the "National Sanitarium Information Bureau" This purported to represent the 'Leading Sanitariums and Health Resorts in the U S The 'Bureau' expected to make its 'profit from the 10 per cent honorarium received on every referred patient" The 'Business Manager' of this concern was one Hubert Miller M D The following advertisement appeared in the classified department of the *St Louis Post Dispatch* in 1915



A layman who wrote in answer to this advertisement received a letter from Dr Lowenthal in which he said that it was his intention to take about thirty patients south with him for four months—cost of trip $500 which includes medical treatment, board etc Dr Lowenthal stated further

I have treated probably more cases of Locomotor Ataxia and Paralysis than any Physician in United States and can honestly state that with Organo Therapy Treatment your walk can be improved and pains controlled

In March, 1919, Dr Lowenthal paid a visit to Spokane, Wash, and Portland, Ore A Portland paper heralded his coming and printed a picture of "Dr A A Lowenthal, World famous alienist" The paper described Dr Lowenthal as "the alienist consulted in the Harry Thaw case" and the one "who treated John Alexander Dowie of Zion City fame and Pope Leo XIII" The fulsome puffery that Dr Lowenthal got while in Spokane drew criticism from one or two members of the local medical profession, who wrote to the newspapers protesting One of the physicians who thus wrote declared that Lowenthal's "coming was announced in a circular sent through the Owl Drug Company which is agent for the sale of products of an organo-therapy company"

Apparently, it was after Dr Lowenthal's return from the Pacific Coast that he commenced to announce his "Post-Graduate Course of Lectures and Clinics" to the physicians of Chicago Denver, St Louis, Columbus, etc—and, incidentally, to bring to the attention of the medical world the alleged virtues of the products of the American Organotherapy Company

Correspondence

THE INCIDENCE OF EXOPHTHALMIC GOITER IN NEGROES

To the Editor —Having recently had in Barnes Hospital a case of exophthalmic goiter in a negro woman, I thought it would be of interest to determine if possible, the relative incidence of this disease in the colored race, as shown by the patients who visit the dispensary The outpatient clinic of the hospital was opened in December, 1914, and since that time there have been 92 000 admissions, including white people and negroes, above the age of 15 years As it was impossible to determine the exact proportion between the races without looking over each card, the following scheme was adopted Through the cooperation of the admitting officer of the dispensary, each new patient was tabulated for a period of a month and it was found that 31 5 per cent of the total number were negroes As there have been 92,000 admissions since 1914, the proportion would be 63,000 whites and 29 000 negroes

In the 63 000 whites there have been eighty-eight cases of exophthalmic goiter, a percentage of 0 13 In the 29,000 negroes there were nine cases or 0 03 per cent These nine cases were all females It must be remembered, however, that white persons are better informed as to the symptoms of exophthalmic goiter, and of various symptoms of hyperthyroidism, some are sent in on account of suspected exophthalmic goiter Negroes are in general less likely to describe the symptoms of such diseases, and are often less minutely examined than white patients

Although the figures I give show the incidence of exophthalmic goiter in a well organized outpatient service, it is probable that a more careful scrutiny would reveal other and less marked cases T C REDFERN, M D, St Louis

d-l-ARABINOSURIA

To the Editor —This condition, of which only forty cases have apparently been reported, occurs in a patient of mine who now, for three or four years has exhibited the same want of resistance to staphylococcal infections as do cases of the more commonly seen glycosuria No treatment yet tried has given immunity He has had chronic intestinal stasis for many years and has much enteroptosis, but under the regimen of the last year his general health has on the whole been greatly improved, and the urine does not now exhibit indican, indol tyramin, etc in any constant amount He is quite refractory to autogenous vaccines of staphylococci even up to repeated doses of $20,000 \times 10^6$ of detoxicated *Staphylococcus albus* and *aureus*

This condition is said to be congenital and to occur among Jews especially My patient is a Jew

I shall esteem it a favor if any readers of THE JOURNAL with special experience in these cases will inform me whether they too have encountered this chronicity of boils and carbuncles and abscesses in the proved absence of glucose and lactose in such arabinose-excreting patients, and whether they have found any means of conferring immunity

A WHITE ROBERTSON, L.R.C.P.E.
52 Welbeck Street, W 1, London, England

Queries and Minor Notes

ANONYMOUS COMMUNICATIONS and queries on postal cards will not be noticed Every letter must contain the writer's name and address but these will be omitted on request

HEYL PRODUCTS NOT ACCEPTED

To the Editor —In a recent number of the *American Journal of Surgery* there is an advertisement by the Heyl Laboratories Inc for Acriflavine and Proflavine The advertisement states that these products have been accepted by the Council on Pharmacy and Chemistry of the American Medical Association for inclusion in New and Nonofficial Remedies In the 1920 edition of N N R I do not find the Heyl products listed although there is a description for Acriflavine and Proflavine Will you please tell me whether or not the Heyl brands of Acriflavine and Proflavine have been accepted by the Council on Pharmacy and Chemistry? G S A M D

ANSWER —We are informed by the secretary of the Council on Pharmacy and Chemistry that the Heyl brands of Acriflavine and Proflavine have been examined by the Council However they were not accepted for inclusion with New and Nonofficial Remedies because (1) the quality did not conform to the Council's standards and (2) in the advertising for the drugs the manufacturer failed to refer to the unfavorable as well as the favorable clinical reports Although informed of the facts some months ago the manufacturer has made no efforts to date to have his products accepted The advertisement cited principally describes "Acriflavine G H' and Proflavine G H ' the G H" probably representing the initials of George Heyl, one of the proprietors of the Heyl Laboratories, Inc The statement in the advertisement that Acriflavine and Proflavine have been accepted by the Council on Pharmacy and Chemistry of the A M A for inclusion in New and Nonofficial Remedies" is misleading in that the reader is likely to infer that the Heyl products have been accepted which is not the case

ANTIDOTES FOR SNAKE POISONING

To the Editor —What information can you give me in regard to Anti Venom antidote for snake bite poison manufactured by the Monarch Drug Company Inc San Diego Calif? W G H

ANSWER —We have no information concerning the Anti-Venom antidote manufactured by the Monarch Drug Company of San Diego Calif Neither this nor any other antivenom for snake poisoning has been accepted by the Council on Pharmacy and Chemistry So far as we know, the United States Treasury Department has issued no license to sell antivenoms for snake poisoning in interstate commerce except to the Pasteur Institute

Experiments made principally in France looking toward the production of antivenoms for snake poisoning by biologic methods seem to have met with some success but the use of such products in therapy is still in the experimental stage In general these studies have shown that the various neurotoxins and hemotoxins of the different poisonous snakes are dissimilar in many respects and that an antivenin which has been prepared against the venom of one species (and is in a sense a specific for that poison) is not always effective when used against the venom of another species Obviously, it is impossible to place therapeutic antivenins for every species of poisonous reptile within the reach of the practitioner In some laboratories of India France and Brazil antivenins are prepared from the most abundant species of snakes in the respective countries

Porto Rico April Examination

Dr Quevedo Baez, secretary, Porto Rico Board of Examiners reports the written and practical examination held at San Juan, April 12, 1920 The examination covered 12 subjects and included 120 questions An average of 75 per cent was required to pass Seven candidates were examined all of whom passed The following colleges were represented

College	PASSED		Year Grad	Per Cent
Georgetown University			(1918)	75
American Med Missionary College			(1906)	84 5
Johns Hopkins University			(1918)	86 2
University of Maryland	(1917)	84 6	(1919)	88 3
Tulane University			(1919)	79 1
University of Havana			(1919)	92 3

THE FOUNTAIN-HEAD OF CHIROPRACTIC, WHAT OF ITS PRODUCT?

The Palmer School of Chiropractic advertises itself as the fountain-head" of chiropractic The following will give some intimation in regard to the character of the stream' that comes from it

The 1920 annual announcement of this school states that students are taught not only 'how to act with patients in and out of the office' but also 'how to successfully advertise" From the beginning therefore methods are taught which, from the time of Hippocrates have been looked on as quackery It is also stated that the students complete their 'freshman sophomore," junior' and senior' courses in four months each, or altogether in sixteen months In another place the reader is informed that in case the student finds it impossible to remain for more than twelve months the school will nevertheless confer on him the degree of D C (Doctor of Chiropractic) By remaining at the school six months longer he would be granted an additional degree that of Ph C (Philosopher of Chiropractic) if he got an A grade on each and every paper submitted '

The statement that a "common school" education is required for admission may mean nothing more than the bare ability to read and write Granting, however that it is the equivalent of the eighth grade in the public schools, the professional training, according to the usual methods of calculating standards in general education, would be considered of no higher grade than that of one or one and a half years of high school work This low entrance qualification is in marked contrast to the requirements for admission to medical schools in which students must have completed a four year high school course and in addition two years of work in a reputable college of arts and sciences, including courses in physics chemistry and biology

Another significant statement in this announcement is that a student 'may matriculate on any week day" This indicates at once that no intensive course of study is given in this institution such as is required in medical schools No student entering a medical school a week or more after the opening of any laboratory course (for example, histology, pathology or bacteriology) could possibly be able intelligently to carry on the work in such courses because of the large amount of work missed during the previous weeks absence Evidently, there are no such disagreeable handicaps in the study of chiropractic

The *announcement of this school states that in its "scientific course'* the student is required 'to attend (note the exact figures) a total of 4 103½ class hours This would be fifty-three hours a week for eighteen months, or eighty hours a week—twelve hours a day—for a calendar year Education does not depend on the number of hours of instruction however so much as on the subject-matter taught and the ability of the instructor to impart knowledge As a matter of fact, the requirement of *actual class-room* work in our highest grade medical schools in four college years of from eight to nine months each is only about 4 000 hours Each class hour, however presupposes from one to three hours of outside preparation so that if measured by the claims of this chiropractic college the total hours required by medical schools would be somewhere between 8 000 to 12 000 hours!

The textbooks used also are interesting In anatomy, the text used is said to be that prepared by Mabel H Palmer D C Ph C (1905) the wife of B J Palmer who is the president of the institution Court reports in 1910 show that the latter had only a common school education and had never matriculated in any school, college or university, other than a chiropractic college For those who never had a training in the scientific methods of treating the sick an attempt to teach others how to do so is equal to 'the blind leading the blind Textbooks of their own writing are also used by the teachers in symptomatology gynecology and chemistry who likewise have no degrees in medicine Incidentally, the sale of these textbooks adds considerably to the revenue obtained from students

Speaking of revenue besides the income from textbooks this institution charges for its twelve or eighteen months' course a spot cash" sum of $300—more than a year's tuition last year in any of the highest grade medical schools of the country! If the fee is paid in "deferred payments,' it is $350 If a husband and wife however, take the course the combined fee 'spot cash is $375 or if in 'deferred payments," $450 Reports of inspection of this school show that there are few if any all-time teachers Such few laboratories as the school possesses are reported also to have the barest minimum of equipment Most of the fees obtained therefore must be clear profit This is in marked contrast with the teaching of scientific medicine in medical schools where the actual average expense of teaching a student each year is more than three times what the student pays in tuition fees!

The low ideals of the leaders of this cult are shown in the report of Mr Justice Hodgins of Ontario issued a few years ago B J Palmer himself is quoted as having stated that bacteriology was the greatest of all gigantic farces ever invented for ignorance and incompetency and that 'the analysis of blood and urine is of no value In this same report other leaders of chiropractic deride also the study of materia medica and chemistry and state they have 'no earthly use for diagnosis They place themselves therefore in direct opposition to Pasteur, Koch Laveran Flexner and others whose discoveries during the last half century have revolutionized the practice of medicine and saved countless thousands of lives! No wonder Justice Hodgins concludes that he could

not bring himself "to the point of accepting, as part of the legalized medical provision for the sick, a system which denies the need of diagnosis, refers 95 per cent of disease to one and the same cause, and turns its back resolutely on all modern medical scientific methods as being founded on nothing and unworthy even to be discussed"

But the teaching in this particular school has further interesting tangents There is also "The Universal Chiropractors Association" with headquarters, evidently at this Palmer School of Chiropractic At least, B J Palmer and Frank W Elliott, the president and registrar of the Palmer School, are, respectively, the secretary, and the treasurer and business manager of the association The members of this association—made up largely of graduates of the Palmer School—are promised protection from, and assistance in cases of, prosecution for violating the law in practicing chiropractic According to the constitution, "The Association, except as herein otherwise provided, shall pay the fine and all costs in all prosecutions, civil or criminal, wherein any member of this class shall be charged in substance with having practiced medicine, surgery, osteopathy, or other method of healing or dealing with the sick or afflicted without a license, or other legal permission, provided such member is in good standing and shall have conformed to the Constitution, Bylaws and all Rules and Regulations of the Association"

The word 'class" in this paragraph refers to "active members' who are described as "all chiropractors of good moral character graduated from or holding certificates of attendance from such chiropractic institutions of learning as are recognized by this association and are practicing specific, pure and unadulterated chiropractics without the use of adjuncts, etc"

The constitution and by-laws of the association are printed in a pamphlet of twenty-four pages, including two pages of instructions as to "What to Do If Trouble Starts" Among the fifteen items in these instructions the following are interesting

11 Be conservative in your claims and be very careful that the enemy does not send any patient to you that they think will die on your hands or otherwise complicate matters Do not unless in a state or province where you are licensed undertake to handle any so called contagious diseases

13 Have as many friends as possible present at your trial Do not make any newspaper announcements without consulting your local attorney

15 If trouble has not really started but there are signs of it let us hear about it by letter

The graduates of this "school" are said to be practicing in Iowa—the institution's home state—in direct violation of the medical practice act and according to the above, they are being encouraged to violate the law in other states

From the foregoing statements it will be seen that the teaching conducted in schools of chiropractic is a menace to education and to public morals as well as to the science of medicine and to rational rules of public health The conclusions justified by the evidence submitted are as follows

(*a*) Leading chiropractors deride or disbelieve in such well known and proved sciences as chemistry, bacteriology and pathology Their teachings are not based on fact and are refuted by the accomplishments of the great minds in education, research science and medicine

(*b*) Their attitude toward these sciences shows their lack of sympathy for the first essentials in the prevention of epidemics and the regulation of public health

(*c*) They declare that education and the ability to make a diagnosis are not essential for the intelligent treatment of human diseases and injuries

(*d*) Their schools at most require only a common school education, a training insufficient to permit the student to undertake intelligently any but the most elementary course of study

(*e*) Their course of professional (?) instruction is too short to enable the student to obtain a training in the sciences necessary for the intelligent or safe practice of the healing art by any method

(*f*) The school teaches and encourages its students to advertise—which they are doing and using the same flagrant methods which have been employed by quacks since the Beginning of medicine

(*g*) Finally, the leaders of this cult openly urge their graduates to practice chiropractic in violation of the law, and have arranged through the Universal Chiropractors Association to aid and abet them in such outlawry

Book Notices

MIND AND ITS DISORDERS A Text Book for Students and Practitioners of Medicine By W H B Stoddart M D F R C P Lecturer on Mental Diseases to St Thomas Hospital Medical School Third edition Cloth Price $6 net Pp 580 with illustrations Philadelphia P Blakiston s Son & Co 1919

Complete conversion to the Freudian theory is the outstanding feature of this volume, comprising a third edition of the author s work 'Mental disease can only be understood by studying the psychology of the unconscious mind of patients, physical manifestation of a functional disorder must be regarded as secondary, not as primary" as the author taught in the earlier editions Dr Stoddart has joined men who, taking a powerful and dominating instinct, built a system around it, reducing all abnormal psychic reactions to it, just as Boris Sidis sought in fear the cause of all pathologic mental processes The fault with the theories of Freud and Sidis is that only the instincts of reproduction and fear are considered There are naturally others aside from these two that play an important part in the development of psychoses and neuroses Psychanalysis then becomes the paramount remedy The author is satisfied that psychanalysis reduces the pulse rate of exophthalmic goiter to normal in from four to six weeks and that the other symptoms are gradually ameliorated in a few months It is natural, then, that a psychoneurosis also 'psychogenetic epilepsy," can be cured only by discovering 'the unconscious strivings which have given rise to the disease, and in so doing to reveal them to the patient" The classification in this edition, while remodeled, still follows that of Kraepelin In the dementia praecox group "provisionally regarded as a psychosis a chapter is added on paraphrenia, a name applied by Kraepelin to a group of delusional cases formerly classed under the dementia paranoides or sometimes paranoia The average age of onset of paraphrenia is later than that of dementia paranoides, usually during the fourth decade Hallucinations developed much later in the course of this disease than in dementia paranoides and there is not the deterioration of personality to justify the appellation dementia In the pathology of manic depressive insanity, the author's theory of intraneuronic intoxication is ingenious, if not convincing The sections on normal psychology (Part 1) and the psychology of the insane (Part 2) are well written and up to date Dr Stoddart has contributed for years to the clinical research into the nature of nervous phenomena associated with mental disorders The outstanding feature of Part 3 (mental diseases) is the detailed description of the different forms of mental reactions especially is this true of the organic group dementia paralytica and others Dr Stoddart s work justifies a careful reading, especially by beginners in the field of psychiatry

LABORATORY MANUAL OF ORGANIC CHEMISTRY By Harry L Fisher Ph D Instructor in Organic Chemistry Columbia University Cloth Price $2 25 Pp 331 New York John Wiley & Sons 1920

Until recently American students in elementary organic chemistry were dependent mainly on foreign manuals for laboratory guidance At this time however it is gratifying to note that notwithstanding the extra burdens of the last three years, two excellent laboratory manuals have been written by American chemists The most recent book, that of Dr Fisher (the other manual was written by Dr Lauder W Jones), follows much the same general outline of subjects as that of its foreign predecessors, it excels though in the thorough manner in which the experiments are detailed One feature that commends the book is the author s insistence on neatness, the vital importance of which should be forcibly brought home to more laboratory workers chemical and medical The author realizes that the place to instil such

habits is the college laboratory In the preface, it is stated (in large type) "It is important that you know what you are doing when you are doing it" Of course, this statement has a double meaning, that is, the instructor must be so well informed with his subject that the student may not be misguided, the present day system of student assistants is often conducive to slipshod explanations The questions at the end of each experiment are well thought out and should serve admirably in keeping both the instructor and the student familiar with organic chemical literature in general The book is a worth while American contribution for those who are interested in the teaching of organic chemistry

SHELL SHOCK AND OTHER NEUROPSYCHIATRIC PROBLEMS Presented in Five Hundred and Eighty Nine Case Histories from the War Literature 1914 1918 By F E Southard M D Sc D Bibliography by Norman Fenton, S B A M Sergeant Medical Corps U S Army and an introduction by Charles K Mills, M D LL D Emeritus Professor of Neurology University of Pennsylvania Cloth Price $10 Pp 982 with illustrations Boston W M Leonard 1919

This is a rather unusual and, at first sight, somewhat bewildering book Possibly these qualities may be in part due to its genesis, as explained by the author It started out to be a supplemental aid in a course of instruction and turned out to be a comprehensive "case-history book on the neuropsychiatry of the war" After evolution to this dignity, an epicrisis of seventy-two pages was superadded so that as fully developed, it constitutes a short clinical history and digest of the neuropsychiatry of the greatest war of history In his introduction, which is a worthy review of the book Dr Mills says "The object of this book is to present both the data and the principles involved in certain neuropsychiatric problems of the war" These are presented in a wealth of detail through an extraordinary series of case records (589 in all) drawn from current medical literature during the first three years of the conflict There are indeed very few phases of war neuroses and psychoses not illustrated in this volume

A LABORATORY MANUAL OF PHYSIOLOGICAL CHEMISTRY By Elbert V Rockwood M D Ph D Professor of Chemistry and Toxicology University of Iowa Fourth edition Cloth Price $2 net Pp 316 with 21 illustrations Philadelphia F A Davis Company 1919

The field of physiologic chemistry is enlarging so steadily, through extensive researches that frequent editions of textbooks are necessary in order to keep pace with the rapid advancement In this edition of Dr Rockwood's manual may be found practically all the modern methods used today in clinical analysis including even the very recent contributions on blood analysis The book will commend itself to physicians who desire to know the modus operandi of laboratory findings, the chemical and medical phases are interwoven carefully As a guide for the student, Dr Rockwood has combined in a most happy way the necessary academic fundamentals of biochemical work with the practical applications The clinician or laboratory technician who desires a compact, not burdensome work will find this book a worthy addition to his library

MANUAL OF DISEASES OF CHILDREN By James Burnet M A M D M R C P Physician for Diseases of Infancy and Childhood to and Physician in Charge of the Child Welfare Clinic at the Marshall Street Dispensary Edinburgh Second edition Cloth Price $3 Pp 416 New York William Wood & Co 1919

This small volume covers the whole field of pediatrics for practically every subject is discussed Of course, in a book of this size one cannot expect to get a complete idea of any subject. The most important symptoms are touched on, frequently in a cursory manner The chapters on infant feeding are written from a standpoint distinctly British and cannot be said to be sufficiently detailed so that one having little knowledge of the subject could derive much benefit from them The preface states that the work is meant for the busy general practitioner but it is hard to see how such a short treatment of the various subjects can be of benefit to the man who has to meet individual cases and account for the various symptoms which present themselves The book has the merit of presenting the author's own view, and as such is to be commended

Medicolegal

Discoveries as to Roentgenogram Not Ground for New Trial

(Caldwell Hoskins et al (Ore) 186 Pac R 50)

The Supreme Court of Oregon in affirming a judgment in favor of the plaintiff for damages for personal injuries, says that the defendants filed a motion for a new trial based on affidavits to the effect that a few minutes before the jury returned the verdict the attorneys for the defendants learned of a rumor that the plaintiff had caused a roentgenogram to be taken, that there was no opportunity to verify the rumor until after the verdict was received, that afterward the defendants ascertained that the plaintiff had gone to a roentgenologist who took a roentgenogram of her spinal column and ribs which showed that there had never been any injury to the spine and ribs, and that the roentgenologist informed her that she had not sustained any injury to her spine or ribs The defendants contended that a new trial should have been granted because (1) the plaintiff was guilty of misconduct in suppressing and concealing the roentgenogram, and because (2) the roentgenoscopy constituted newly discovered evidence which the defendants could not with reasonable diligence have discovered and produced at the trial But the evidence about the rib and spine affected the amount of the verdict rather than the right to a verdict The roentgenoscopy was not made until six months after the date of the injury The roentgenogram was not made a part of the record or exhibited to the trial judge There was no affidavit by the roentgenologist notwithstanding the fact that the plaintiff testified as a witness in her own behalf, and by doing so consented that the physician might testify as a witness While the court does not intend to decide whether the trial judge could have compelled the plaintiff to submit to an examination on the application of the defendants yet the court may with propriety note the fact that the plaintiff was not requested to permit physicians chosen by the defendants to examine her condition, and so far as the question of her injury was concerned the defendants were apparently willing to rest their whole case on the testimony of one physician and of one of the nurses at the hospital The plaintiff was a witness in her own behalf and she was cross-examined The defendants had ample opportunity to inquire as to whether or not any other physician had examined her and whether a roentgenogram had been taken and yet no such inquiries were made In view of the fact that the defendants did not take full advantage of the opportunities offered by cross-examination and in view of the other facts shown by the record the court does not think it would be justified in reversing the trial court and holding that he should have allowed a new trial on the ground of newly discovered evidence Nor does the court think that it could fairly be said that the plaintiff was guilty of suppressing evidence She knew whether she suffered any pain and she also knew where the seat of the pain was So overwhelming was the evidence that it might be said to have conclusively established that she suffered pain in the side The physician who examined her on the evening of the accident stated that he did not discover any broken rib or twisted spine The physician who called on her five days afterward and from that time on acted as her attending physician testified that her rib was broken and that her spine was twisted The roentgenogram was not taken until six months after the accident and for aught that appeared in the record the broken rib if there was one might have completely united leaving no evidence of a former break The court was not advised as to whether medical men would say that a break either sometimes or always leaves evidence of the break which a roentgenogram will invariably picture, nor does it know how serious the break must be in order to leave permanent evidence of the fracture If the plaintiff's rib was broken it might be that it was a slight break and no evidence of the fracture remained when the roentgenogram was taken The plaintiff was not bound to believe the opinion

of the physician who took the roentgenogram six months after the accident, but, knowing that she actually suffered pain, and having been told by her attending physician that her rib was in truth broken she had a right to believe, as she undoubtedly did that her rib was broken, and she was under no obligation to call the roentgenologist as a witness merely because his opinion, based on an examination made six months after the injury, differed from the opinion of her attending physician

Death from Influenza Not Increased Risk of Military Service

(Myli American Life Insurance Co (N D) 175 N W R 641
Benham American Central Life Insurance Co (Ark) 217 S W R 467)

The Supreme Court of North Dakota in affirming a judgment in favor of the plaintiff in the Myli case which was brought to recover the face of a life insurance policy says that it appeared that the insured had enlisted in the United States navy during the recent war and had been assigned to Dunwoody Institute in Minneapolis for instruction and training While so assigned he was taken ill with the influenza and died in the city hospital The insurance company denied liability for more than the amount of the premiums previously paid on the ground that the insured had not obtained a permit under the clause of the policy which provided that if the death of the insured should occur while engaged in military or naval service in time of war without previously having obtained from the company a permit therefor, the company's liability should be limited to the cash premiums paid But the court holds that in view of the other provisions of the policy with respect to double indemnity for accidental death and disability benefits the foregoing provision did not exempt from liability for the face of the policy when the death of the insured was not occasioned by extra hazard incident to military or naval service On the question of the proof that the insured came to his death while subject to the hazard of naval service it was clear that such was not the case He was in an inland city and not subject to any risks not common to civilians with whom he was constantly associated

In the Benham case, the Supreme Court of Arkansas takes a somewhat similar view and reverses a judgment that was rendered on a verdict that was directed in favor of the plaintiff for only the reserve accumulated under the policy The court says that the insured in this case enlisted in the aviation branch of the military service of the United States After being on duty for a while at an aviation camp in Texas, he was sent to Cornell University for special training and later was ordered to report at Camp Dick, Texas but en route to Camp Dick he contracted influenza and on his arrival at Dallas was transferred to a hospital where he died The record in the case showed that the influenza was prevalent throughout the United States, and that soldiers and civilians alike contracted it and died from it and the court does not think that the death of the insured was in any sense caused by performing any military service or in consequence of being engaged in military service The words in the restricted clause of the insurance policy under consideration in this case meant something more than death to the insured during the period of time he was in military service The word 'engaged' denotes action It means to take part in So here the words death while engaged in military service in time of war meant death while doing performing or taking part in some military service in time of war, in other words it must be death caused by performing some duty in the military service That is to say in order to exempt the company from liability the death must have been caused while the insured was doing something connected with the military service, in contradistinction to death while in the service due to causes entirely or wholly unconnected with such service By the use of the word 'engaged it must have been intended that some activity in the service should have caused the death in contradistinction to merely a period of time while the insured was in the service

AMERICAN ASSOCIATION OF ANESTHETISTS

(Concluded on page 1540)

Anesthesia Problem in Goiter Surgery

DR ANDRE CROTTI Columbus Ohio Both local and general anesthesia are methods of choice in goiter surgery When expertly used and the dangers of general anesthesia are obviated and the psychic shock of local anesthesia is controlled the choice between the two methods of anesthesia seems to be a matter of personal cohesion In using general anesthetics for goiter surgery it is vital to prevent their alarming reflex reactions during induction, as well as any tendency to respiratory embarrassment or cardiac collapse vomiting and acidosis The use of preliminary narcotics and concomitant oxygenation is advisable Atropin to prevent cardiac collapse would be invaluable if it were not too toxic in effective dosage Too often failures and misfortunes are charged to the anesthetic when the fault lies in the judgment of the surgeon and an injudiciously performed operation For the time being the most popular anesthetic for thyroid surgery is ether I have operated in more than 1 000 cases of goiter under ether I no longer resort to anociation While nitrous oxid-oxygen anesthesia may be safe and efficient in some clinics I have found it too fraught with abrupt complications that are difficult for any but the most expert anesthetists to handle or avoid Ether has a greater leeway for controlling any alarming states that may arise during its administration

Anesthesia Problem in Goiter Surgery from the Surgeon's Point of View

DR VILRAY P BLAIR, St Louis The temperament and technic of the operator have in a general way a much stronger bearing on the proper choice of the anesthetic than the chemical properties or physiologic reactions that are peculiar to any particular agent The similarity of results obtained by different men who with large experience, have concentrated on a certain method of anesthesia, does not mean that there can be no elements in the particular case pertaining to the choice of the anesthetic, but rather that the proper correlation of the anesthetic to the technic is of vastly more importance than the particular anesthetic agent employed Studies in metabolism show that the patients who do badly react in this manner because of the degree of thyrotoxicosis rather than because of any errors in anesthesia management Toxicity is in proportion to the mass of the gland Those who employ a general anesthetic with the best results are the men who produce the least psychic shock, operate quickly with the least traumatism and remove large amounts of the toxic gland Under ether the increased respiration of the excitement stage, followed by acapnia will be more likely to cause paralysis of the respiratory center in those cases in which the disease has progressed to secondary damage to the nervous system Ether has been shown to favor a postoperative acetonemia and a rapid exhaustion of the glycogen reserve of the body through stimulation of the metabolic rate My own experience causes me to use local anesthesia for goiter patients who are really sick either from intoxication or degeneration in essential organs, but for simple cases and milder intoxications I use ether and in tracheal collapse, rarely present I use intratracheal ether insufflation

Value of Anociation in Goiter Operations

DR W E LOWER Cleveland The vital test of any surgical method is found not in its effect on the moderate risk or even in its effect on mortality rate alone but rather in the mortality rate plus the postoperative morbidity Anociation implies an all-inclusive operative technic adapted to the individual case whereby the noxious influences—psychic and

traumatic—which inevitably attend any surgical procedure are minimized or eliminated So sensitive is the thyrotoxic patient that the anesthetist during the operation, will often be able to note when the knife has passed beyond the blocked zone by the altered pulse and respiration, which in the unconscious state in this disease respond to contact with a like exaggeration to that noted in the conscious patient In this operation, as in almost no other, therefore, the anesthetist and the operating surgeon must work in accord It follows that the ideal anesthetist in this operation is one whose specific training as an anesthetist is combined with sufficient knowledge of operative technic to assure the recognition of the approach to shock-producing areas in the course of the operation In no other class of cases is the value of nitrous oxid-oxygen, as compared with ether more clearly demonstrated The absence of nausea, the easy and quickly attained unconsciousness prevent or minimize the dread of the anesthetic which in the multiple stage operations in particular might become a dangerous factor Moreover, with nitrous oxid-oxygen, the degree of unconsciousness may be graded to suit the condition of the patient at every stage in the operation

Clinical Observations on Nitrous Oxid-Oxygen Anesthesias in Hyperthyroidism

DR LINCOLN F SISE, Boston In the clinic of Dr Frank H Lahey, patients get rest in bed for a number of days, depending on their toxicity Two hours before operation they receive a hypodermic injection of ¼ grain of morphin and 1/200 grain of scopolamin and this is repeated one hour before operation After the gas oxygen is started the head is well extended Procain is used in the skin and other sensitive structures, and accurate gentle surgery with careful control of bleeding, is employed throughout Almost without exception these patients go under anesthesia in a minute without disturbance of any kind Pushing the anesthetic during induction may cause a fall in the rate of the pulse and respiration Toxic cases seem to require a higher percentage of oxygen to maintain their color than do nontoxic cases, as the extra oxygen is needed to maintain their abnormally rapid metabolic activities Ordinary surgical shock is not present in goiter surgery except in cases in which the trachea is involved and respiration obstructed Respiration during the operative procedure runs about normal Under local anesthesia alone the pulse rate may be increased by 50 beats, but following the administration of nitrous oxid-oxygen there is a decisive drop The highest point reached by the pulse soon after the operation may be taken as an indication of the severity of the reaction to the anesthetic and surgical procedure This point is practically always reached within half an hour after the patient leaves the operating room It is also the best standard available by which to measure the intensity of the thyrotoxic storm

Ether-Oil Colonic Anesthesia in Goiter Surgery

DR. WALTER LATHROP Hazelton Pa Ether-oil colonic anesthesia is most decidedly in favor of the colonic method of anesthesia originated by Gwathmey The method is especially efficacious in thyrotoxic patients Ether-oil colonic anesthesia is contraindicated in patients having colitis hemorrhoids or other rectal irritations We have had but two cases of postoperative irritation or looseness of the bowels in all our work The after-effects are equal to or better than those in the inhalation cases, and postoperative vomiting is reduced to a minimum while the effect of the anesthesia is such that most patients rest very quietly for some hours after operation and complain of little or no pain aside from the throat irritation that would follow any method after removal of the thyroid Occasionally colonic anesthesia needs to be supplemented by a few whiffs of chloroform Also the anesthetist must see to it that respiration remains free and that some of the anesthetic mixture is withdrawn should the patient exhibit signs of going too deeply under the anesthesia The safety limit of this method of anesthesia is extended by the gradual absorption of ether by the colon and its rapid elimination by the lungs The principal factor of safety is the wide margin between the dosage required for surgical narcosis and that which produces toxemia Colonic anesthesia may be administered to the patient in bed and the operation performed without the patient's knowledge, especially in those instances in which the surgeon and anesthetist are dealing with high-strung nervous patients, with increased blood pressure and possible myocardial degeneration

Thyroidectomy Under Local Anesthesia

DR CARROLL W ALLEN, New Orleans I prefer to use local anesthesia in all cases without exception If the patient can be operated on at all the procedure can be done more safely under local than under general anesthesia This also holds good for polar ligations in bad risks as a preliminary step to the more radical operation Regional anesthesia is very limited in its application to goiter surgery and has no special advantages A thorough knowledge of the neuro-anatomy of the parts involved is essential for success in using local anesthesia

---

AMERICAN GYNECOLOGICAL SOCIETY

Forty Fifth Annual Meeting held at Chicago May 21 26 1920

The President, DR ROBERT L DICKINSON New York, in the Chair

Analgesia and Anesthesia in Labor

DR EDWARD P DAVIS Philadelphia The best quality of ether, skilfully administered is successful in the majority of cases of spontaneous labor during the second stage If given at the height of the pain and quickly removed as soon as the pain subsides it stimulates and does not retard labor The moment when expulsion occurs a few deep inhalations without air will render the patient insensible to pain although capable of comprehending sensations of feeling, of hearing or often of sight The mother rouses easily after delivery, and requires no anesthesia while the placenta is separating For the insertion of stitches immediately after labor ether properly administered with oxygen is comparatively safe and efficient We have seen no evidence that such use during the stage of expulsion injures the fetus

Induction of Labor Use of Pituitary Extract

DR BENJAMIN P WATSON, Toronto Ont Pituitary extract is a most valuable agent for accelerating the second stage of labor when delay is due to feeble uterine contraction I have used it extensively for the induction of labor and during all stages of labor and have never had any bad results The method used is to begin with a dose of 0 5 to 1 cc administered intramuscularly with a long needle In most cases uterine contractions commence in about ten minutes and increase in severity during the next twenty minutes At the end of this time the second injection of 0 5 cc is given If after a time the contractions tend to weaken or to come at longer intervals, the dose is repeated As many as six or eight doses may thus be given at intervals of about half an hour The important point is to administer a further dose before the effects of the previous one have entirely passed off The effects from a single dose appear to last only for about half an hour and there is no cumulative effect When the cervix has begun to open and the membranes to bulge into it the uterine contractions will continue without the further administration of the drug The failures I had in the beginning were the result of not pushing the dosage far enough It is perfectly safe to give eight or ten 0 5 cc doses at half-hour intervals

Induction of Labor at Term

DR CHARLES B REED, Chicago Labor can be inaugurated by quinin and pituitary extract by castor oil and quinin, by the modified de Ribes bag or by both The castor oil acts in about two cases out of five and most reliably when the patient is a little bit past the calculated date The Voorhees bag is the most dependable

Prophylactic Forceps Operation

DR JOSEPH B DE LEE, Chicago The prophylactic forceps operation is the routine delivery of the child in head presenta-

tion when the head has come to rest on the pelvic floor, and the early removal of the placenta Primiparous labors, and those in which the conditions of the soft parts approximate a first labor, are treated by this method which really comprises more than the actual delivery of the child It is a rounded technic for the conduct of the whole labor, with the defined purpose of relieving pain, supplementing and anticipating the efforts of nature, reducing the hemorrhage, and preventing and repairing the damage

Value of Wassermann Reaction in Obstetrics

DR J WHITRIDGE WILLIAMS, Baltimore Among 4,000 parturient women a positive Wasserman reaction was noted in 421 Of 302 children born dead or who died during the two weeks following delivery, death was proved to be due to syphilis in 102, while a positive maternal Wassermann reaction does not necessarily mean the birth of a syphilitic child, a negative reaction does not necessarily imply the absence of syphilis

Extraperitoneal Cesarean Section

DR JOHN A MCGLINN, Philadelphia The Beck operation, with thorough protection of the peritoneal cavity and perfect peritonealization of the uterine incision, is superior to the transperitoneal operation as a routine procedure While theoretically it is not as efficient as the extraperitoneal method, practically on account of the many disadvantages of the latter, it is the better operation

Artificial Impregnation

DR ROBERT L DICKINSON Brooklyn Tubal patency must be established by simple instillation of sterile fluid in the knee-chest posture Semen does not run true to form a single test being of little value Immediately before each injection, the microscope must be used Injection is made first, until uterine then tubal discomfort or mild colic shows the lateral reservoirs filled Pregnancy followed five times in three patients Repeated injections for several months should be specified There were no troublesome painful reactions, except in one instance in thirty-two injections

Neglected Form of Cervical Endometritis

DR HENRY T BYFORD, Chicago As a result of acute cervical endometritis, a permanent exudate is sometimes left about the internal os uteri, where there is a greater thickness of the mucosa This constriction ring not only produces the characteristics of stenosis in many cases but also gives rise to the ordinary symptoms that are usually attributed to endometritis The symptoms vary greatly in different patients depending partly on the interference with the patency of the lumen, the chronicity and the associated pelvic conditions, and partly on the patient's general resisting powers and nervous habits The diagnosis is made by means of the sound which detects a tender area at the internal os and which causes more or less bleeding In the more chronic cases, firm pressure exerted by a dilating sound produces a slight discharge of inspissated mucus, which adheres to the sound The treatment calls for gradual progressive dilatation with round dilators under the strictest aseptic and antiseptic precautions and later stimulating applications of iodized phenol The occasional failure of an Emmet trachelorrhaphy to cure the symptoms is laid to a persistence of such an exudate at the internal os

Treatment of Suppurating Wounds Following Abdominal Section

DR. THOMAS J WATKINS Chicago No sutures are removed on account of suppuration, except when they cut deeply into the tissues and no drains are inserted No probing is permitted Moist boric acid dressings are placed over the wound as soon as signs of suppuration appear and are continuously applied until the amount of drainage becomes scant and until excessive redness disappears The moist dressings are used to keep the wound secretions from desiccating and to promote drainage A large amount of drainage will take place through very small openings when thus treated, the drainage will be efficient and the suppurating surfaces, by virtue of atmospheric and intra-abdominal pressure will keep in relative apposition The wounds heal quickly, the treatment is painless, the patient is not unnecessarily disturbed mentally and the ultimate strength of the abdominal wall is seldom injured by the suppuration When the discharge ceases, no open wound remains to heal by granulation Antiseptic solutions are not employed, as they injure the tissues more than they harm the bacteria

Hemorrhages Into Pelvic Cavity Other Than Those of Ectopic Pregnancy

DR RICHARD R. SMITH, Grand Rapids Mich The most frequent source of such hemorrhage is the ovary a ruptured graafian follicle or corpus luteum, hematoma ovarii and ovarian tumors (cystic or solid), although the tube may on rare occasions give rise to hemorrhage A tube involved in the twisted pedicle of an appendage is a good illustration of such hemorrhages Intraperitoneal hemorrhages may occur from fibroid tumors

The Importance of a Follow-Up System

DR GEORGE W KOSMAK New York In view of the liability to injuries resulting in invalidism remaining unrecognized in the usual postpartum examination a discharge of the patient should not be made for at least three months after the birth of the child During this interval at least two or three examinations of the patient should be made Of forty eight American maternity hospitals thirty-six maintain some sort of follow-up system but in the majority of the latter the patients return only if abnormalities develop A regularly organized postpartum clinic should be part of the equipment of every maternity hospital and in connection with it an organization of social service workers or follow-up nurses to visit the patients in their homes is essential The necessity of more prolonged postpartum observation should be included in every scheme of hospital standardization and the shortcomings of institutional work in this field applies with equal force to private patients The advisability of some form of maternity insurance may do a great deal to obviate some of the difficulties connected with the scheme of more prolonged postpartum care of obstetric patients

Operation or Radium for Operable Cancer of Cervix

DR WILLIAM P GRAVES Boston Personal experience with radium in cancer of the cervix has not justified its use in operable cases as a substitute for radical operation Success depends largely on equipment and method of application not possessed by the users of moderate quantities of radium Operation is the treatment by choice by those to whom the highly developed radium therapy is not available

Radium Treatment of Cervical Cancer

DR FREDERICK J TAUSSIG St Louis Radium treatment of uterine cancer should be kept in the hands of the gynecologist rather than the roentgenologist but such a gynecologist should seek preliminary training in the use of radium and must have continued opportunity for observation and treatment of cancer cases in order to reduce mistakes to a minimum

Operation is to be preferred in the case of all operable patients under 35 years of age and in the early operable cases beyond this age Radium is to be recommended wherever obesity or lung heart or kidney lesions make operation difficult or dangerous and in advanced operable borderline and inoperable cases but not in the advanced inoperable group with cachexia It is better to treat the advanced inoperable cases with acetone since radium increases the tendency to fistulas and pain in most instances

A New Method of Covering Raw Surfaces on the Uterus

DR GEORGE GELLHORN St Louis The fundus is pulled backward and upward in the direction of the promontory The reflection of the bladder peritoneum on the cervix is incised transversely as in a hysterectomy and pushed off from the uterus The uterus is then tilted forward, and the bladder peritoneum is pulled over the uterus and stitched to the posterior aspect of the fundus, where an intact peritoneal surface presents itself *In small uteri the bladder*

peritoneum may be fastened as far back as the insertion of the sacro-uterine ligaments, if necessary The entire fundus with its denuded area is thus covered by peritoneum If an inverting stitch is used, even the catgut knots become invisible The newly formed covering consists only of the bladder peritoneum which, in many cases, is so thin and transparent that the raw uterine surface and even the volsella holes may be distinguished The method not only supplies the raw fundus with a new serous coat, but it also safeguards a normal position and mobility of the uterus, and the late results have remained most satisfactory It is, however, not to be relied on exclusively in a case of fixed retroflexion I have never observed an instance of vesical disturbance other than those that may follow any laparotomy

Lutein Cysts Accompanying Hydatidiform Mole

DR W A COVENTRY, Duluth, Minn In one case the ovarian tumors appeared with the mole (in fact, somewhat clouding the history of mole), and in the other case the tumor seemed to arise and started to grow rapidly after the mole had been removed These multiple lutein cysts are different from those normally appearing during pregnancy They accompany only the formation of chorio-epithelioma and mole, and are probably not to be found in any associated condition

Tuberculosis in Guinea Pig after Subcutaneous Infection Tracheobronchial Lymph Nodes A K Krause Baltimore —p 135
Factors that Influence Development of Tubercle in Lymph Nodes of Guinea Pig A K Krause, Baltimore —p 193
*Vincent's Spirochete and Hemorrhage in Pulmonary Tuberculosis A N Sinclair Honolulu —p 201

Tuberculosis After Subcutaneous Infection—After subcutaneous (right groin) infection of guinea-pigs with massive doses of tubercle bacilli the bacilli are carried centralward by the lymphatic stream and thence into the blood and throughout the body with great facility and rapidity Krause is of the opinion that for a time after pulmonary infection (infection, not lesion) is first established, most bacilli are expelled from the lung (of the guinea-pig) by the lymphatics Many experiments made by Krause have shown this In the tuberculous guinea-pig gross lesion of the lung is not indispensable to the appearance of gross lesion in the tracheobronchial nodes Lesion in the latter very commonly exists without lesion in the lung The amount of involvement of the tracheobronchial nodes is directly related to the amount of tubercle that may be present anywhere in the body But, since under ordinary conditions the spleen is the most extensive depot of tubercle in the guinea-pig, the condition of the tracheobronchial nodes usually reflects that of the spleen

Tuberculosis of Lymph Node—In the guinea-pig, Krause says, the existence of tubercle in a lymph node is contingent on the occurrence of a lesion at a point peripheral to the node The progression or retrogression of tubercle in this animal's lymph nodes is largely dependent on the progression or retrogression of the peripheral foci

Spirochetes and Lung Hemorrhage—A rounded, definitely limited roentgen-ray shadow about the size of a small orange, was noted by Sinclair just to the right of and slightly below the level of the hilum in twenty-three cases complicated with hemorrhage and Vincent's spirochete and *B fusiformis* were present in the sputum in large numbers Of 410 sputum examination, 256 showed the presence of the spirochete while 182 were complicated with hemorrhage Of the 154 negative cases 56 were complicated with hemorrhage The corollary of this shows that of 238 cases with hemorrhage the spirochete was present in 182, and of the 172 cases without hemorrhage the spirochete was present in 74 If the series of cases under consideration is divided into those cases in which cavitation can be ruled out (incipent cases), and those cases in which there is a probable or evident active cavitation (advanced cases), there will be 205 incipient and 205 advanced cases Of the 205 incipient cases, 118 had hemorrhage, and in all but 13 the spirochete was demonstrable Also of the 56 cases in which the spirochete could be found, there was active cavitation in 43

*Significance of Hematuria A L Chute Boston —p 623
Chronic Fatigue Diet Exercise and Other Factors in Treatment J Bryant Boston —p 629
*Infection of Knee Joint Treated by Early and Continuous Active Motion F B Lund Boston —p 631

Hematuria—A study of 100 cases of hematuria which probably represents pretty much the ordinary run of such cases Chute says, proves very definitely that hematuria is not a condition to be looked on lightly that in more than one half of the cases it is indicative of an extremely serious condition which is only remediable if recognized and treated early, that in only a small proportion of cases, more especially in the cases of bleeding nephritis, can it be said that it makes no real difference whether they are attacked early or not, that in these very cases, however, it is essential that they be investigated for the simple reason that in most instances without this investigation it is utterly impossible to distinguish them from cases of hypernephroma where an early diagnosis and early removal of the growth are essential if one is to accomplish anything in this class of tumors of the kidney Study of a considerable number of cases of hematuria compels Chute to conclude that the physician who told his patient that he might safely ignore his bleeding showed poor judgment medically, that although he was partially right this was due to good luck rather than to sound medical judgment

Active Motion in Infected Knee Joint.—A bullet located in the capsular ligament was the cause of the infection in Lund's case The joint was opened and a large amount of seropurulent fluid escaped The bullet was found and removed A rubber tissue drain was placed in the popliteal space and a dry sterile dressing applied Active motion was started the next day This was regularly continued daily, the temperature gradually going up until a collection of pus in the upper part of the popliteal incision was drained and a rubber tube put in Then a pus pocket above the upper end of the wound in the popliteal space was opened At this time the active motion was not as free as it had been on account of the swelling and tenderness in the popliteal space The patient was then put on the Carrel treatment under which the amount of pus gradually diminished The active motion was continued though not quite to the same extent as the first Lund is convinced that in this case active motion from the first gave an excellent result, although recovery was delayed by the complication of the abscess in the popliteal space

Syphilis as Cause of Death of Fetus—Williams' paper is based on the study of 302 fetal deaths occurring in 4 000 consecutive deliveries Of the 302 dead babies, 212 came to necropsy In the former are included not only those dying at the time of labor or during the two weeks immediately following it, but also those dying during pregnancy from the time of viability onward, 157 occurred at the time of labor or during the first two weeks of the puerperium and 145 were in premature children Syphilis was noted in 104 cases in eighty-nine of which the diagnosis was confirmed by necropsy with the demonstration of spirochetes in the fetal tissues, while in the remainder it was made from the presence of syphilitic lesions in the placenta, associated with a positive Wassermann on the part of the mother

Auricular Fibrillation—Eighteen cases are reported by Mason In about 7 per cent the arrhythmia was transient or paroxysmal Cardiac disease was a nearly constant finding In a few instances in which the only evidence of cardiac disease was an attack of auricular fibrillation it was necessary to assume that cardiac changes due to arteriosclerosis or hypertensive vascular disease were present

Acidity of Gastric Contents.—Shohl claims that the expression of gastric acidity in terms of p_H (hydrogen-ion concentration) brings out clearly the relation between acidity and peptic digestion

Colorimetric Determination of Free Hydrochloric Acid—A new colorimetric method is presented by Shohl and King which determines the amount of free hydrochloric acid in the gastric contents A simple color comparison shows both the amount and concentration of the acid The procedure is Take 2 c c of filtered or unfiltered gastric contents Add 2 drops of 0 2 per cent thymolsulphonephthalein Compare the color of the sample with standard solutions containing the same amount of the same indicator The result can be read directly in hydrochloric acid in 100 c c of gastric contents The method is accurate and applicable to clinical tests

Biology of Hemolytic Streptococci—In a study by Bliss of twenty-five strains of *S hemolyticus* isolated from the throats of patients with scarlet fever, twenty or 80 per cent, were agglutinated by four different antistreptococcic serums made with streptococci isolated from scarlet fever cases None of these strains were agglutinated by five antistreptococcic serums of nonscarlatinal origin (except in the few instances noted) But three of seventeen strains of nonscarlatinal origin were agglutinated by these three serums of scarlatinal origin and these three may have been either atypical scarlatinas or scarlatinal contacts Certain differences in cultural characteristics, particularly in the fermentation of carbohydrates, were noted

Digestibility of Chicken Skin.—In experiments made by Kohman and Shonle in which over 65 1 to 67 5 per cent of the nitrogen of the diet was supplied by chicken skin especially prepared for eating there was as good utilization of nitrogen as when the same proportion of the nitrogen was supplied by meat eggs and milk The skin used for these experiments had 26 3 per cent fat and 3 03 per cent nitrogen To prepare it for eating it was rolled in balls and fried

Effect of Sleep on Alkali Reserve—Collip found that the alkali reserve of the blood plasma is either unaltered or depressed during sleep An actual increase in the C_H of the blood during sleep is indicated.

Formation of Acetone Bodies During Anesthesia—Acetone bodies were not formed promptly enough during ether anesthesia in cases reported by Short to account for the decreased plasma bicarbonate present in the blood plasma

Vitamin in Milk.—Attempting to duplicate the results of Hopkins Osborne and Mendel fed diets consisting of casein or edestin starch a salt mixture lard and other butter fat along with fresh milk offered in varying quantities In con-

tradiction to some of Hopkins' results they found, under the conditions of their investigation, that 2 c c of milk per day rarely sufficed to enable rats, on the diets mentioned, to make more than very slight gains in weight Many of the animals were barely maintained when such small quantities furnished the sole source of water-soluble vitamin Not until at least 16 c c of fresh milk per day were supplied along with the food mixture was anything approaching a normal rate of growth secured Even this amount sometimes failed

Effect of Radium on Metabolism.—Solutions of sodium chlorid which contained active deposit from radium emanation were used by Theis and Bagg The injection was followed by an increased output of nitrogen, reaching the maximum figure on the second day after treatment The absolute as well as the relative amount of total nitrogen excreted as ammonia nitrogen was decidedly increased The effect seems to be cumulative

Nutritive Factors in Plant Tissue.—According to Osborne and Mendel, the newer studies indicating the richness of many types of plant tissues in those nutritive properties termed vitamins, place the dietary importance of the green vegetables in an entirely new light It emphasizes their use to supplement the refined foods of the modern food industry which furnish products rich in proteins, fats and carbohydrates but in many cases comparatively deficient in the vitamins The fats cited in the present investigation along with others recently published serve as an added reminder that the fat-soluble vitamin need not be sought solely in foods known to be rich in fats

Studies of Acidosis.—Methods are described by Cullen and Van Slyke for separation of the fibrin, globulin, and albumin of blood plasma in such a manner that they may be determined by the Kjeldahl method

Nitrogenous Constituents of Human Blood.—Hammett's studies of the chemical composition of human blood indicate that while the total nitrogen, nonprotein nitrogenous constituents, and the sugar in the blood vary in the same person from week to week there is a tendency for the level of these variations to be characteristically individual The sum of the average deviations of the constituents for any given individual may be an index of the metabolic stability of that individual

Dropping Bottle as an Aid in Macroscopic Slide Agglutination C Krumwiede New York—p 155
*Complement Fixation Test for Tuberculosis H O von Wedel—p 159

Antihuman Hemolysins and Hemagglutinins.—While practically all horse serums contain agglutinins for human erythrocytes, Kolmer and Matsumoto believe that it is highly probable that the intravenous injection of preserved horse serum does not introduce sufficient agglutinin and hemolysin for human erythrocytes to produce ill effects referable to intravascular agglutination and hemolysis, this is particularly true if the serum is diluted and injected slowly

Immune Agglutinins and Hemolysins for Erythrocytes.—The immunization of rabbits with human corpuscles belonging to Groups I, II III and IV does not result in the production of specific agglutinins and hemolysins for the corpuscles of the group employed in immunization, but Kolmer and Trist found that these serums frequently show slightly more agglutinin and hemolysin for the corpuscles of the group used in immunization than for the corpuscles of the remaining groups For the grouping of human erythrocytes it does not appear possible to prepare specific immune serums, human serums containing iso-agglutinins and hemolysins must be used and these are best preserved in a fluid state at or near the freezing point

Typhoid Agglutinogens.—A comparative study of agglutinogens prepared from a single strain of typhoid bacilli which had been used for agglutination tests for several years, was made by Sands An agglutinogen is best prepared by cultivating on solid medium for forty-eight hours, removing the growths with from 0.85 to 1 per cent chemically pure sodium chlorid in distilled water, shaking with beads until a perfectly homogenous emulsion is secured, diluting with saline solution to proper density (about 2,000,000,000 per cubic centimeter), and adding neutral liquor formaldehydi to 1 per cent

Preparation of Typhoid Antigen.—The general result of Matsumoto's study and a review of investigations by others indicate that the similar bacterial antigens in which is employed the whole micro-organism either living or dead in physiologic sodium chlorid solution or in culture broth, are superior to filtrates and constitute the antigens of choice for the conduct of complement fixation tests in bacterial infections

Effect of B Coli Vaccines on Intestinal Colon Bacillus.—In the case of a number of dogs Torrey and Rahe found it possible to effect the temporary suppression of a certain variety of *B coli* normal to the intestinal tract through inoculations with a specific vaccine Autogenous vaccines are apparently necessary for marked results and the dosage must be large Cultural results indicating a decrease in numbers of the type of *B coli* in question were associated with a coincident rise of specific antibody in the blood A uniform diet must be maintained, otherwise the effect of the vaccine will be obscured

Tuberculosis Complement Fixation Test.—The results of 6,128 complement fixation tests made by von Wedel on 1,207 serums from 1,000 patients point to the fact that this is not a 100 per cent test for the diagnosis of tuberculosis A considerable percentage of serums from incipient and far advanced cases apparently contain insufficient antibodies to fix complement, no matter what system or what antigen is used for the test This fact, therefore, precludes the probability of a 100 per cent test based on complement binding antibodies in the patient's serum About 70 per cent positive results appears to be the average finding, with all types of unselected active tuberculous cases, for many thousands of complement fixation tests made by many serologists, using tubercle bacillus suspensions or tuberculins as antigens The reactions are weakest when the patient exhibits few, if any, symptoms of tuberculosis, while they are most definite and strongest in the incipient and moderately advanced cases exhibiting marked symptoms The results are therefore more confirmatory than actually diagnotic in the largest percentage of cases However, when used intelligently, along with the clinical history, the results justify its more extended use

Retrograde Stretching of Impermeable Cardiospasm.—Retrograde stretching with the pyloric dilator is preferred by Einhorn to passing bougies over a previously swallowed string It sometimes happens that even a flexible instrument cannot follow the string, if there is present too great a bend in the sacculation or an unyielding spasm at the cardia In cases in which an ulcer in the stomach is suspected or really discovered it is advisable first to accord the esophagus and stomach a period of rest before instituting the stretching treatment The later is best done first by the pyloric dilator every other day or twice a week, the dilator being introduced before retiring supplemented by a dose of atropin, and stretching done the following morning After a few stretchings the dilator enters the stomach in a much shorter time

Anesthesia Problem in Chest Surgery—This paper is based on between eighty and 100 animal experiments, and a large clinical experience with surgical teams working in the advanced zone of the American Army and confining themselves almost exclusively to chest surgery

New Method for Clinical Diagnosis of Toxic Thyroid States—Having observed that with normal dog thyroid random samples of exophthalmic goiter serum would bind powerfully, and that they would not bind with any other dog organ, Berkeley and Koopman made fixation experiments on more than 175 human serums, of which forty were under suspicion of positive thyroid dyscrasia Of the forty eighteen were clinically undoubted exophthalmic goiter, two were probably so ten were doubtful, and ten were probably not exophthalmic goiter The eighteen positive cases were all from one to four plus The probable cases were positive, six of the ten doubtful cases were positive, the ten probably not were all negative As to the controls, numbering more than 135 patients, all were negative except one with a tertiary specific skin lesion on one knee The new test has been repeated hundreds of times and has been checked up with all needful controls This reaction is apparently due to a specific thyroid substance which combines with an antibody in the blood of the patient The test is described in detail

Autonomic Disorders of Stomach—Wheelon and Thomas review the literature showing that the stomach may be regarded as an autonomic organ influenced to cooperative activity because of the intergrative action of the central nervous system acting through the vagus and splanchnic nerves The normal stomach is one in which added to its myogenic properties, a proper reciprocal innervation is maintained associated with a balanced chemism Alterations in any one of these elements will of necessity break the balance, and resulting pathologic functioning or symptoms will be in proportion to the degree of severity of the alteration

After Effects of Influenza—Outstanding features of the report by Mason are the high proportion of cardiac cases covering a wide range of seriousness the abnormal development of tuberculosis and pretubercular conditions and the large number of throat affections Hardly less striking is the absence of affections of the urinary organs from the statistical record The total number of persons examined was 7 058 Of this number 5 624 required medical attention and 1 434 were examined but not recommended for treatment, and 2015 were reexamined Defective vision hypertrophy of tonsils and adenoids diseases of respiratory tract, asthenias, cardiac diseases and defective teeth were the conditions encountered in greatest numbers The number of tuberculosis cases was striking in the respect that they were in nearly every instance new cases never before reported to the health department Mason links up with this epidemic the unusually large number of sudden deaths and presumably from heart disease, in persons who had had influenza

Wassermann Test in Primary Syphilis W H Guy Pittsburgh—p 341

Acquired Pulmonary Syphilis—Although questioning the great frequency of lung syphilis which some writers maintain, Funk believes that among chronic lung patients will be found some who suffer because of a syphilitic lesion in the lung Among the nontuberculous group, those comprising the mycotic infections, chronic abscess, tumor, pneumokoniosis, etc syphilis is no mean contender Health can sometimes be restored in a few weeks or in a few months to persons who appear to be in the last stage of pulmonary tuberculosis Funk agrees with Hoffman, who states that patients have perished from pulmonary syphilis improperly treated under a mistaken diagnosis of pulmonary tuberculosis, etc, where restoration to health might have been possible had appropriate treatment been promptly instituted

Lung Abscess Following Tonsillectomy—The possibility of aspiration of infected material as a cause of pulmonary abscess is not denied by Simpson and Noah, yet they believe that more cases occur as a result of hematogenous infection than is generally supposed

Acute General Peritonitis in Infants—Four cases are reported by Ross The ages of the patients were 4, 8 and 3 weeks and 4 months respectively Only one case was characterized by persistent vomiting Neither diarrhea nor constipation were prominent features All patients had some elevation of temperature, high at the onset Cyanosis was present in one case and great depression in all cases The symptom common to all was marked distension of the abdomen with general abdominal tenderness In all cases the peritonitis seemed to be a part of a general septicemia complicating infectious processes in other parts of the body

Errors in Diagnosis of Pulmonary Tuberculosis—In the 471 necropsies at the Phipps Institute there were six cases which were not tuberculous, of these six two were properly diagnosed (both cardiovascular disease) and four were diagnosed tuberculosis, though one was carcinoma one actinomycosis and two cardiovascular disease This represents an error in less than 1 per cent These statistics constitute Walsh's personal experience with advanced cases diagnosed by about twenty different physicians, and, coming as they do from necropsies on consecutive deaths represent what a study of the physical signs can accomplish

Bacteriology of Pneumonia—The widespread and early bronchial changes, the marked proliferation and partly its catarrhal inflammation of alveolar epithelium in the lungs Lucke believes to be the result of the bacillus of influenza The damaged tissue thus produced is readily invaded by other organisms These, then, produce divers tissue changes, each typical of the species of invading micro-organisms

Spinal Cord Paraplegia Due to Tumor—Diller and Gaub cite the case of a healthy woman, aged 28, who had been for two years growing progressively weaker in the legs until they finally became almost completely paralyzed During this time she suffered considerable pain in and around the anal region, spreading over the buttocks Finally, impairment of sensation of all kinds from the level of the navel downward, exaggerated knee jerks on both sides, more marked on the left than the right ankle clonus and Babinski were noted At operation, there was found a small elongated tumor about the shape of the last phalanx of the little finger but smaller, growing from the dura and pressing across the cord below the level of the ninth thoracic vertebra It was easily removed and proved to be an endothelioma The cord was indented distinctly by pressure of growth but apparently uninjured The patient made a good recovery from the operation, showing some movement of the toes the next day She steadily gained more and more movement until at the end of two months she was able to stand and walk Sensory changes disappeared within two weeks and by the time the patient left the hospital knee jerks were normal and ankle clonus and Babinski toe reflexes were absent

Diverticulum of Bladder—Payne has operated successfully in three cases Radical extirpation was done in two cases, and a plastic operation, after the method of Squier, was done in the other case

Foreign Body in Bronchus—During an epileptic fit Gill's patient swallowed a piece of an artificial plate denture seven years ago Shortly following the accident the patient began having an itching and tickling sensation in her throat which gradually developed into a cough and became steadily worse more so at night Eighteen months after this injury the patient while bending over had a hemorrhage She has had hemorrhages at various intervals since but only when stooping over The roentgen ray located the foreign body in the right bronchus opposite the ninth rib using posterior markings and opposite the fourth interspace using anterior markings The fragment was removed with the aid of the bronchoscope

Scleroderma and Spinal Sclerosis—These two conditions were combined in Murchison's patient About two weeks after recovering from the grip, the symptoms of sclerosis appeared About one year after the attack of grip the first symptoms of scleroderma were noted.

Vaccine Therapy in Gynecology and Obstetrics R Robertson —p 328
Types of Tachycardia and Irritable Heart A Goodall —p 334

Blood Transfusion in Pernicious Anemia—Of the twenty-three patients treated by transfusion by Graham transfusion was called for in thirteen within one year or less of the first symptoms of anemia In six cases the symptoms had existed for from one to two years The remaining cases were of a more chronic type In thirteen cases the patients had suffered from one or more relapses In ten cases, the symptoms were progressive Three patients were transfused a second time One patient was transfused on three occasions Direct transfusion from artery to vein was performed in nineteen cases and indirect transfusion from vein to vein in seven cases Citrated blood was used on two occasions It is definitely stated by Graham that although transfusion may cause a remission of symptoms it cannot bring about a cure in a case of pernicious anemia or alter in any material way the nature of the disease The ideal method of transfusion in Graham's opinion is either direct from artery to vein or, preferably indirect transfusion from vein to vein A large amount of blood is unnecessary owing to the risks of overtransfusion and to the fact that the benefit conferred by transfusion is not necessarily in proportion to the volume of blood received A repetition of transfusion should be considered when the symptoms relapse or if the first transfusion fails to produce the desired effect Transfusion is not to be regarded as an alternative to other forms of treatment but as a therapeutic agent available when the usual measures have failed

Fracture and Osteitis Fibrosa—In one case cited by Greig a fracture of the femur in childhood healed well and was followed by no untoward circumstance whereas a fracture of the leg seven years later was followed by an osteitis fibrosa of the tibia and a fracture of the same femur shortly afterward was followed by a similar affection of that bone Greig suggests that such an extraordinary occurrence points surely to some constitutional peculiarity of the bones or of the osteoblasts, so that the fresh deposition of healthy bone is interfered with The second case too is interesting in that the affection of the tibia was not preceded by a fracture it was apparently the result of overexertion

Neonatal Mortality—Newsholme discusses this subject from the standpoint of its relation to public health He suggests the establishment of antenatal and postnatal clinics, skilled care during parturition, maternity homes and hospitals, a raised standard of midwifery practice

Lemon Juice in Prevention of Scurvy—Lozenges of dried lemon juice are used by Bassett-Smith The juice of fresh lemons is roughly filtered through muslin and then through filter paper under reduced pressure by means of a water pump The filtered juice is evaporated in vacuo over sulphuric acid at ordinary temperature (from 13 5 to 15 5 C) The residue of noncrystallizable syrup is worked up into as stiff a paste as possible with a mixture of anhydrous lactose, 97 per cent, gum tragacanth 3 per cent The paste is cut up into sections each containing the juice of half a lemon These are rolled, faced with the mixture and pressed to assume the lozenge form These tablets have been stored at 15 30 and 37 C for months, and have been employed in experiments The average yield of juice from one lemon is about 48 c c, and each tablet contains the equivalent of 24 c c of unfiltered juice The whole process takes about five days, no heat whatever is used

Effect of Lead on Erythrocytes—When lead is given, in health or in minor ailments, the blood film in most persons shows, in from three to seven days, a few polychrome, polychrome punctated and punctated reds Craik's impression is that punctated disks are always polychrome when they first appear Polychromasia means premature birth of the erythrocyte, and punctate basophilia denotes something more pathologic Even in mild anemia the former is seldom absent, whereas the latter is rarely present, unless the anemia is really serious Only when punctate basophilia is seen in normal blood associated with but little polychromasia is it pathognomonic of lead poisoning Thus lead enables one to turn into the circulation marked disks by which parasites may be traced Accordingly, in two mild tertians, with infected corpuscles less than one in 500 and with practically normal blood, this mixture was given lead acetate, 20 grains, dilute acetic acid 1 dram, chloroform water, 8 ounces Signa 4 drams, t d s On the fourth day, young rings were found in polychrome and in punctated disks Young parasites occurred in normocytes also and some marked disks were uninfected Next day ameboid and large pigmented forms were seen in punctated disks as well as rings Craik thinks that this proves the life of a punctated disk to extend to two days at least In polychrome or in polychrome punctated disk there were never seen any but young rings This proves that within twenty-four hours the polychrome disk develops into a normocyte In the same time a polychrome punctated disk becomes a punctated red Craik thinks that a similar test with the quartan parasite would show that punctation disappears within seventy-two hours in approximately normal blood Multiple infection suggests that certain corpuscles are less resistant than others and are the youngest corpuscles

*Full Time Tubal Pregnancy Cesarean Salpingectomy Recovery R E Smith and C B Leeds —p 1163
Medical Progress in China Since the Republic Wu Lien Teh —p 1203

Pathology of Lethargic Encephalitis—The material forming the basis of the pathologic inquiry made by Bramwell consisted of five fatal cases He found (1) hemorrhage rare, (2) edema of the nerve tissue, (3) proliferation of neuroglia, and (4) infiltration of nerve tissue and perivascular lymph sheath with cells, usually lymphocytelike in type These changes were seen most strikingly in the ventral portion of the pons, especially in the region of the substantia nigra, implicating the fibers of the third nerve as they pass out, and thus accounting for one of the common symptoms of the disease In no case were any organisms, or bodies suggesting organisms, seen

Extension for Diseased Joints—If a diseased joint is moved forcibly without being extended, the articular surfaces are bruised or otherwise damaged, and acute inflammation follows only too frequently, whereas under the influence of extension, the surfaces of the fixed or displaced joint can be moved freely on one another, so that such movement is followed by a minimum degree of rapidly subsiding inflammation The apparatus used by Lane, although not original with him by means of which extension is kept up on the affected joint is applied to the limb and the patient at once proceeds to lead an active life The mode of treatment varies to some extent with the joint affected By means of extension and movement, Lane has been able to restore the function of many joints which would otherwise have been fixed, probably in a bad position, and materially interfering with the usefulness of the individual

Modified Smallpox.—The cases cited by Allingham followed the same course with varying severity, in conformity with their vaccinal states, each exhibiting similar characteristics as regards rashes and distribution In each case headache was followed in three days by a papular rash (on forehead and chest), rapidly becoming vesicular and gradually involving the whole trunk and extremities equally Flexor surfaces were affected as much as extensor with several spots in both axillae, palms of hands, soles of feet, and soft palate were quite free The vesicles were discrete, soft and flat, some were ovoid, not umbilicated and collapsed on puncture As no history of contact with smallpox could be obtained in the first case, the diagnosis of chickenpox was made, but on the eighth day of the first rash a second rash made its appearance, unaccompanied by any constitutional disturbance except a slight headache in the mildest of the three cases This secondary rash, which was petechial, deep and somewhat shotty, affected those parts more especially involved in true smallpox, that is, the brow, wrists, extensor surfaces of the forearms and legs, palms of hands and soles of feet, in two cases vesicles were seen on the soft palate By this time most of the first rash was becoming dry, but many vesicles still remained full of lymph and quite soft The two rashes were quite distinct and could easily be differentiated Allingham suggests that it might be wise to insist on isolation of chickenpox for the first ten days

Full Time Tubal Pregnancy—That incomplete rupture of one or more of the coats of the tube may not have occurred in the earlier months of the pregnancy is not denied by Smith and Leads but if it did, there was later sufficient reinforcement by adhesions and localized *protective peritonitis* (as shown by repeated alarms) to thwart complete rupture and allow a viable child to go to full term until delivered by surgical interference

Trauma and Tuberculosis—It is Oliver's opinion that when tuberculosis follows injury it is more in consonance with pathologic experience to believe that a tuberculous lesion had been present in the body previous to the accident and had been lying dormant All that injury, therefore could do, would be to rouse into activity a lesion which has been inert probably for years The subject of trauma and tuberculosis has received additional interest and opportunities of investigation during the war owing to the large number of gunshot wounds of the chest wall, superficial and penetrating Oliver's experience is that only in a extremely small number of wounded soldiers has the relationship been observed

Vaccines in Skin Diseases—Of all the cutaneous conditions which MacLeod and others treated with vaccines, the only ones in which immediate and definite benefit resulted were suppurating staphylococcic lesions especially acute recent and recurrent boils by vaccines both stock and autogenous they had been able to cause the rapid involution of boils without the assistance of any form of local treatment and in almost every case to keep the patient free from recurrences though there was often a tendency to relapse after the treatment was discontinued In the case of chronic boils such as those about the back of the neck in which the circulation through the boil is impeded by the formation of scar tissue the results were uncertain and, as a rule, unsatisfactory In acne vulgaris, the results were not encouraging, where suppurative lesions predominated, the vaccine treatment caused a diminution in the pustulation but did not influence the comedones and when it was discontinued an exacerbation of suppuration generally took place In those cases of acne, chiefly in adult women in which the comedones were few or absent and which were associated with small more or less indolent subcutaneous abscesses little or no benefit was derived from the treatment In sycosis barbae of coccogenic origin the results were uncertain and not to be compared with those from other methods In tuberculosis cutis, improvement was obtained from Koch's original tuberculin in lupus with superficially ulcerated patches and healing had taken place in such lesions on the subsidence of the local reaction, but this procedure, even when small doses were given, was regarded as too dangerous for fear of lighting into activity unknown foci of the disease in other organs The results with bacillary emulsion were irregular and, though some improvement was obtained at times in superficially ulcerated patches of lupus and in scrofulodermia in no case did they find that the benefit from it was in any way equal to that which could be obtained by appropriate local treatment

Postoperative Treatment of Appendix Dyspepsia—Flint suggests that patients who present a history of prolonged appendix dyspepsia, previous to the acute attack or attacks should have merely water by mouth for several weeks after appendectomy, provided that the physical state is sufficiently good to permit of this rather stringent treatment The ordinary medical treatment of gastric ulcer should be followed after operation

Acquired Immunity to Influenza Dopter —p 415
Tumor of Uterine Cervix in Monkey Marullaz —p 417

Esophageal Diverticulum—Hartmann's patient was a woman of 61 who for nine years had had symptoms indicating a diverticulum in the upper esophagus For the last ten months there had been excessive flow of saliva and frequent regurgitation of food and swallowing had become more and more difficult When the neck was stretched a tumor appeared at the side of the neck most pronounced on the left Hartmann made an opening into the stomach and through this fed the patient for a month until she had regained strength Then he removed the diverticulum through an incision along the inner margin of the sternomastoid muscle It opened into the esophagus at the junction with the pharynx where there is always a weak point in the wall The ease of the operation and the complete relief from all disturbances justifies similar intervention in such cases In a second case in a man of 65 there is so little disturbance that surgical measures are not required as yet

Extrasystolic Arrhythmia A Mougeot —p 402

May 5 1920 **34**, No 24

Diagnosis of Bradycardia D Routier —p 417

Auscultation of Venous Pulse—Josue declares that auscultation of the venous pulse will supply information in the majority of cases such as can be obtained otherwise only by cardiographic methods of exploration It is no more difficult than auscultation of the heart He describes the points which differentiate bradycardia of sinus origin the sounds heard on auscultation representing the peaks of the cardiogram etc The subject must be reclining flat on his back the head low without a pillow The stethoscope is applied between the sternal and clavicular attachments of the sternocleidomastoid immediately back of and as close as possible to the clavicle The stethoscope should not be applied perpendicularly to the axis of the neck but should almost parallel it slanting downward backward and inward, pointing to the mediastinum The pressure should be minimal and the subject should hold his breath during the auscultation The radial pulse helps to explain the sounds

Paroxysmal Tachycardia—Chevallier enumerates a number of things that can be done to arrest by reflex action a paroxysm of tachycardia swallowing a chunk of bread an emetic to induce vomiting, lying on the back and breathing slowly keeping the chest full of air drinking something with big gulps tickling the pharynx with a feather, pressing on the right pneumogastric in the neck or giving every ten minutes a cachet of 0 15 gm pituitary extract If the paroxysm keeps up some preparation of digitalis may be needed and if there is accompanying fever a purge and then 6 or 8 gm of sodium salicylate daily with sodium bicarbonate for a few days and then half the dose During the intervals moderation in all things should be the rule Paroxysmal tachycardia is not incompatible with an active life Specific treatment is required for the syphilitic even if there is nothing to suggest the syphilitic origin of the tachycardia Sedatives may prove useful for the nervous and ovarian treatment in climacteric conditions Perseverance is the main factor in successful treatment

Radiology of the Kidneys after Insufflation of Air into Peritoneal Cavity L Ribadeau Dumas, Mallet and de Lauleric.—p 418

The Lower Margin of the Liver—Glenard and Aimard do not think it necessary to insufflate oxygen for investigation of the lower margin of the liver except in very dubious cases Radioscopy alone is generally sufficient, the question then is whether the shadow below the liver is from the enlarged gallbladder or an appendicular lobe This can be decided by palpation with the thumb Seated on the bed facing the patient, at the close of inspiration, the thumb tries to lift up the crest of the margin of the liver working from below upward and from behind forward first raising the right lumbar region to bring the crest into prominence and pressing down on the left iliac fossa to drive the mass of intestines back under the liver With this thumb procedure, the liver lobe is easily distinguished by its shape from the rounded lower pole of the gallbladder It also helps to distinguish between pain in the gallbladder and pain in the liver, and often renders roentgen examination superfluous

*Glucose Excretion Threshold in Diabetics F Rathery and E Gruat.—p 372
Cereals in Treatment of Diabetics E Lambling.—p 378

Epilepsy in Relation to Diabetes—From four cases of his own and from a study of the cases reported in the literature, Labbe concludes that diabetic epilepsy is a manifestation of acidosis In cases of acidosis in which there is no cause for assuming uremia or any other intoxication, occasionally epileptiform seizures develop which it seems justifiable to associate with acid intoxication They are localized or general, and are followed by loss of consciousness, either transitory or prolonged They may precede diabetic coma, or appear after the diabetic coma has begun, or occur long before coma sets in

The Excretion Threshold for Sugar in the Blood in Diabetics—By the excretion threshold Rathery and Gruat designate the level of the glucose content of the blood above which the surplus is thrown off by the kidneys Sodium chlorid and glucose are typical threshold substances, in contrast to other substances such as urea uric acid, methylene blue etc, which the blood tends to eliminate so long as there is any present As the result of analysis of their own cases and study of the literature Rathery and Gruat have reached several definite conclusions in regard to the excretion threshold for sugar in diabetes A high glucose threshold does not necessarily signify a case refractory to dietetic treatment, nor does a moderately high threshold imply a mild diabetes

Variability of the threshold is more significant than its mere increase A high threshold, with great variability, points to easily controllable diabetes, but if the threshold does not fluctuate much, then a high level is of grave import A moderately high but nonfluctuating threshold is of doubtful prognosis The relations between the rise of the threshold and the degree of glycosuria have likewise a prognostic and therapeutic value, as they explain in detail When the glucose threshold and the degree of glycosuria vary in the same direction, the main thing to note is the degree of stability of the threshold If the glucose threshold and the glycosuria vary inversely either the threshold is high and the glycosuria is nil or very slight, or the threshold is low and the glycosuria is high In the former case the prognosis is usually unfavorable In the latter case the prognosis is somewhat more favorable provided the threshold is slightly variable The glucose threshold varies greatly in different diabetics The excess of glucose in the blood above the glucose threshold will explain a certain number of glycosurias, but not quite all The variations in the glycosuria are at times quite incommensurate with the modifications of the hyperglycemia In any event, in different subjects there is a wide range of difference in the percentage of glucose excreted in the urine in the presence of a given hyperglycemia, for the reason that the kidney itself plays an important part in the modifications of the percentage of glucose excreted

Absence of Anaphylaxis Producing Sensitizer in the Mishaps from Neo Arsphenamin G Milian.—p 391
Technic for Radium Treatment of Cancer of Esophagus and Larynx J Guisez.—p 392

Uremia in Hemolytic Conditions—The last few years have demonstrated the frequency of uremia with infectious jaundice with or without kidney disease Gilbert and his co-workers here report instances of uremia accompanying jaundice in blackwater fever in pernicious anemia, and in chronic jaundice with enlargement of the spleen and hemolysis In six of seven cases of pernicious anemia the urea content of the blood was over 0 7 gm The maximum was 2 7 gm in one case in the terminal phase, in the terminal phase of tuberculosis and cancer they never found over 0 31 to 0 54 Both retention of urea and exaggerated production seem to be involved in this Perfusion of hemoglobin directly into the liver of a dog not only increased production of bile but also increased production of urea, the liver evidently predominantly responsible for both The urea content of both blood and urine was found extremely high in cases of hemothorax These and other facts cited seem to sustain the assumption that, in the domain of the general circulation, urea is produced by a mechanism very comparable to that of the production of bile The liver is responsible for both, depending on the same factor, destruction of blood The question now is to determine to what extent hemolysis is involved in other causes producing urea

May 8 1920 **28**, No 29

*Treatment of Neurosyphilis J A Sicard.—p 281
*Diagnosis of Ulcer in Digestive Tract L Meunier.—p 283
Pathogenesis of Osteoma in Muscle Nathan.—p 284
Present Status of Treatment of Chancroidal Bubo L Chemisse.—p 285

Treatment of Neurosyphilis—Sicard gives neo-arsphenamin in doses of 0 15 gm dissolved in 1 c c of distilled water, injected every day or second day, without any mercury He asserts that this method of daily small doses subcutaneously or by the vein has given remarkable results in neurosyphilis during his two years' experience with it He thus gives during the year up to a total of 8 or 10 gm for paraplegia, 20 or 25 gm in tabes, and 28 or 30 gm in general paresis Some patients in the course of the two years have taken up to 40 or 50 gm This technic he says, avoids serious reactions, prevents anaphylaxis, and the outcome in his 200 cases

is at least equal to that with other methods and usually surpasses it Among the four types of minor by-effects was erythema, observed early in the treatment in about 7 per cent and tardily in 2 or 3 per cent , tardy jaundice in 2 per cent , transient slight uremia was common He suggests that possibly the puffiness of the face and ankles with large doses of arsenic may be from retention of chlorids In about 6 per cent of his 200 cases in the course of treatment it proved impossible to elicit further the Achilles tendon reflex This *arc flexic achillécnne* he continues, has persisted unmodified in his cases to date, while the knee jerk never showed any change He adds that it might be possible to utilize in treatment of spastic disturbance and contracture this affinity of arsenic for the neuromuscular-tendon system of the back of the leg

Diagnosis and Location of Ulceration in Digestive Tract—Meunier explains that blood is not found in the digestive tract as such but only in the form of hematin and this is usually coated with mucus in case of an inflammatory process Neither are soluble in water, gastric juice or duodenal juice but both are readily dissolved by ammonia To differentiate an ulcer and locate it he gives through the stomach tube 200 c c of water containing 10 drops of official ammonia, after two days of a milk-vegetable diet The stomach content can then be examined at once for blood The stools are not examined until the next day, to allow for demarcation with charcoal With this ammonia technic, blood is detected in the stomach content so frequently that he is convinced that every true pain in the stomach is traceable to some solution of continuity in the mucosa whatever the nature of the gastric secretion When there is no blood in the stomach content but the stool shows blood then the ulcer symptoms can probably be referred to the duodenum Blood from hemorrhoids is in the hemoglobin form soluble in water, but blood from the intestines above is in the form of the insoluble hematin and can be dissolved by addition of a little ammonia to the stools To differentiate ulcer from cancer he keeps the patient in bed a week, examining regularly the stomach content by the ammonia technic, the persistence of positive findings testifies to cancer This *repos hemostatique* has often rendered the greatest service in excluding malignant disease

*Pericarotid Sympathectomy R Leriche—p 301
Minor Signs of Lethargic Encephalitis H Roger—p 302
*Relative Size and Shape of Heart and Body A Martinet—p 302
Cysts in the Wris and Tuberculosis J Murard—p 304
Carbon Monoxid Poisoning L Binet—p 304

Pericarotid Sympathectomy—Leriche announces that removing the sheath of sympathetic nerve fibers around the internal carotid artery for a stretch in the neck, causes pronounced constriction of the carotid artery for a few hours and other effects such as we are accustomed to observe only after removal of the superior cervical ganglion including durable enophthalmos ptosis, miosis and transient vasodilatation in the fundus of the eye The results in his four cases suggest that excision of the cervical ganglion is a mutilation out of all proportion to the purpose as the desired effects can be obtained by merely excising some of the isolated fibers, instead of the whole of the ganglion For example, in exophthalmic goiter, this denudation of the carotid artery might cure the exophthalmos, severing the superior cardiac nerves might arrest the tachycardia, supplemented by resecting the sheath of nerve fibers surrounding the superior thyroid artery In trigeminal neuralgia, pericarotid sympathectomy of both carotid arteries might answer the purpose The intense constriction of the carotid artery under irritation of its sympathetic innervation shuts off the blood from the brain and this might explain sudden death under certain jiu-jitsu maneuvers or accidental hangings This temporary reduction of the caliber of the carotid might possibly be utilized to ward off hemorrhage in operations on the brain It might explain also some of the pathologic phenomena observed with fracture of the skull

Relative Size of Heart—Martinet uses a sliding gage like that used in shoe stores to record the diameter of the chest from axilla to axilla, he records also the longest longitudinal and transverse diameters of the heart and the minimum (slanting) diameter of the aorta These, with the height furnish an index of the relative values of heart and aorta with different builds Even merely dividing the height by the chest diameter gives a more instructive index of robusticity' than any hitherto suggested He was impressed with the close connection between the diameter of the chest and the diameter of the aorta and also between the measurements of the heart and aorta and the blood pressure particularly in those with sluggish circulation and weak pulse The index thus throws light on diagnosis, prognosis and treatment Several charts showing the various measurements are reproduced

*Principles for Syphilometry A Vernes—p 156

The Principles of Syphilometry—Vernes applies this term to measurement of the intensity of the syphilitic infection at a given moment and he shows how it is possible to supervise the course of the case by repeated simple colorimetric syphilimetry The main thing is to have a suspension of ultramicroscopic particles of a determined size and known stability for the standard reagent always alike He is director of the Institut Prophylactique, and his innumerable tests of various substances for the purpose showed that both organic and mineral substances can be utilized but he has found most satisfactory a mixture of thirty-nine parts of 9 per thousand sodium chlorid solution with one part of what he calls perethynol which is obtained by repeated extraction of pulverized horse heart in a vacuum with ethylene perchlorid and alcohol The perethynol is a solution of 15 gm of this dry extract in 1 000 gm of alcohol at 60 C This extract provides particles of a constant average size when mixed properly with the salt solution under control of the absorption of light by the particles Flaking occurs when normal human serum is added to the suspension but the flaking is much more intense with syphilitic serum and the degree of flaking is an index of the severity of the syphilis at the moment Pig serum prevents flaking or if the flaking has occurred, dissolves the flakes On the other hand pig serum lakes sheep erythrocytes But if it has exhausted its energy against the flakes it is incapable of laking the erythrocytes or if it is only partially exhausted it will lake only part of the erythrocytes These properties of pig serum are utilized for the systematic syphilimetry and it is thus transformed he says from empiric guesswork to a rel[illegible] For this the human

to the test suspension and then, after a certain interval the sheep corpuscles—all in exactly calculated amounts This reveals the flocculation induced by the syphilitic serum but which has been held in check by the pig serum, the tint from the amount of laking produced forming the colorimetric scale A previous communication by Vernes on the nature of the seroreaction in syphilis, was summarized in THE JOURNAL, Aug 2 1919, p 372 He gives here the list of his various publications on the subject referring for the minuter details of his technic to the *Bulletin des sciences pharmacologiques* **25** 321 1918, and **26** 449, 1919

*Acute Appendicitis in Children J Dubs —p 341
Backward Protrusion of Aneurysm of Aorta M Pierroz —p 346
Climate of Certain Swiss Health Resorts W Knoll —p 349 Conc n

Differential Diagnosis of Acute Appendicitis in Children—Dubs recalls that children and some adults localize pain in the stomach region when the appendix is the seat of the disease process Also that when the symptoms seem to suggest acute appendicitis the contrast between the serious general condition and the slight local findings in the appendix region along with the sudden high fever up to 39 5 or above should suggest the false appendicitis of pneumonia With pneumococcus peritonitis the pneumococci have been found in the urine even from the earliest phase of the peritonitis and girls from 4 to 10 are the ones usually affected Dubs obtained a positive response in six of nine cases Ileus from ascarides and tuberculous mesenteric glands are generally mistaken for appendicitis, and both seem to be becoming more frequent of late Rost has recently demonstrated substances in the ascaris body which have a tonus increasing action and others a tonus depressing influence while fluid from the interior of the ascaris body is extremely irritating In only six of eleven cases of primary tuberculous mesenteric glands was the diagnosis made before the operation The patients were from 6 to 18 years of age and all have been apparently cured by the operation whether the symptoms were from a recent acute exacerbation of the mesenteric tuberculosis or the rupture of one or more old cheesy glands In both events the ileocecal region is the one generally involved and the rupture cases induce a clinical picture very much like that of perforated appendicitis Even when the abdomen has been opened the tuberculous mesenteric glands and the glands sharing in the disease with acute appendicitis closely resemble each other, so that differentiation may be difficult, palpation is the main reliance The children with mesenteric tuberculosis are generally frail the temperature high, but the general condition is comparatively good in contrast to the high fever, and the extremely mild local findings He has never excised tuberculous mesenteric glands, restricting his intervention to injection of one or two syringefuls of iodoform oil in the abdominal cavity and suturing at once without draining His cases all made a clinical recovery under general treatment for tuberculosis and he is positive that mesenteric gland tuberculosis is more common than generally supposed, and often heals spontaneously

Acetonuria in Influenza G Izar —p 453
*Treatment of Empyema E Gallo —p 454
Lethargic Encephalitis with Crossed Paralysis E Bandiera —p 456

Vaccination Against Whooping Cough—Luzzatti thinks there can be no question of the prophylactic efficiency of the antipertussis vaccine he used in three families with numerous children when one of the children in each family developed whooping cough None of the two or three other children showed any signs of the disease They were given the preventive injection when the older child began to cough Not until ten days later was the diagnosis of pertussis made absolutely certain by the typical paroxysms There was no attempt at isolation of the younger children but none showed any signs of the disease except one child that developed a catarrhal cough which soon subsided without any spasmodic tendency The vaccine was made by Nicolle of Tunis from agar blood and Martin broth cultures of the Bordet-Gengou bacillus centrifuging repeatedly with fresh amounts of a solution of sodium fluorid until the emulsion was rinsed free from toxic products with 500 millions per cubic centimeter heated to 104 F for forty-eight hours He applied the vaccine in treatment in a number of advanced cases of whooping cough but was unable to detect any benefit from it The outcome might be better when given earlier

Empyema—Gallo uses a cannula with guide and oval disk for siphon drainage through the eighth interspace on the posterior axillary line In a case described at the eighth day the long tube was discarded and through a Potain aspirator he injected into the pleural cavity 200 or 300 c c of dilute hydrogen dioxid aspirating it out again at once This daily rinsing out of the cavity was kept up for twelve days and then the cannula which had been left in place throughout was finally removed With this simple technic, ideal healing was complete in less than a month

*Echinococcus Cysts in Children V Zerbino —p 46
*Supernumerary Ureters L Piñeyro Carve —p 100

Echinococcus Disease in Children—Zerbino states that in a total of 1,511 cases of echinococcus cyst since 1896 at Montevideo children formed from 20 to 32 per cent The cyst makes itself manifest in a child usually in from one to six years, while in adults the interval is from two to eight years His experience does not confirm Deve's assumption that hydatid cysts in adults can generally be traced back to childhood

Double Ureters—Pineyro cites Motzfeld's statement that he found anomalies in the kidneys in 1 75 per cent of 4,500 cadavers This included 0 51 per cent double ureters Weigert found 10 per cent and Piñeyro has encountered four cases himself, which he describes reproducing the roentgen findings One man of 37 had bilateral double ureters, and in one young man the left kidney was removed on account of partial pyonephrosis and two ureters were found In another man the diagnosis of the double ureter was made from the cystoscopic findings of the two ureter mouths In his fourth case there seemed to be merely an accessory ureter These anomalies are liable to entail serious trouble on account of the small size of the lumen In examining the bladder we must not be content with locating the normal ureter mouths but should seek for an extra mouth or mouths

Vaccine Treatment and Prophylaxis of Tuberculosis K Shiga—p 239

Spirochete of Rat-Bite Fever in Field Mouse—Kobayashi and Kodama found *Spirochaeta morsus-muris* in 12 and 54 per cent of field voles from two districts Monkeys inoculated with cultures from the mice developed antibodies with spirocheticidal action, but the strains from the two districts behaved differently The article is in English It concludes with the suggestion that this species of field vole, *Microtus montebelli*, may prove useful in research on spirochetes

Bodies Resembling Spirochetes in Cultures of Certain Bacteria—The plates show the spirochete-like bodies as observed in anaerobic cultures of motile bacteria with flagella They seem to be a production of the bacteria themselves or represent the flagella in a certain condition They are readily differentiated from true spirochetes by their staining properties and motility, but the research reported testifies that cultivation of any species of spirochete is not complete until a pure subculture can be obtained (Compare with editorial June 26, 1920, p 1783)

Vaccination Against Tuberculosis—Shiga emphasizes that the only positive prophylaxis against tuberculosis is to attack it before it has induced manifest symptoms In the last four years he has treated 300 tuberculous patients with his T B serovaccine, including twenty of prophylactic vaccination For this he uses dilutions of 1 5000 for five weekly injections, 1 1000 for four injections, 1 500 for three, 1 100 for three and then living avirulent tubercle bacilli 1 20 for two injections The temperature is taken for a week before commencing the course, and if there is fever, the vaccination is begun still more cautiously

Syncopal Attacks—Stier states that syncopal attacks are to be regarded as the result of abnormally intense oscillations in the blood circulation which rest exclusively on an inherited constitutional inferiority of the neurovascular apparatus Many of these attacks are of purely reflex origin As to the mechanism of the process we may assume that the quick contraction of the cerebral vessels due to emotional disturbances, and the resultant sudden shifting of masses of blood to the internal organs and more especially to the abdominal organs which normally is followed by a dilatation of the cerebral vessels in a syncopal attack become too intense and the dilatation of the cerebral vessels does not occur in time The clinical picture however requires the recognition of certain psychic factors Syncopal attacks seldom occur in children under circumstances that endanger their lives—never on the street when at play or in swimming or the like—but almost always at home when help is near From this fact it is evident that aside from the reflex process in the neurovascular apparatus psychic factors play a decisive part, among which is weakening of the will power or when the surroundings are such that the child feels that he can yield to the strain

Neo-Arsphenamin in Gangrene of Lung and Chronic Bronchitis—In chronic bronchitis following pneumonia and influenza Becher has found injections of neo arsphenamin (neosalvarsan) successful in two cases One patient had been expectorating profusely for three months He was given two 0 6 gm doses of neo-arsphenamin intravenously The third day following the first injection the daily amount of sputum had increased slightly from 200 to 225 c.c, but then it fell rapidly to 10 c c in two days and in a day or two more had ceased altogether and did not return T patient gained rapidly in weight, and felt and l

better The Wassermann reaction was negative In Case 2 the bronchitis, following influenza had lasted for two months, and the sputum had amounted to 200 c c daily It began to decrease the third day following the first injection of neoarsphenamin, and by the seventh day had dropped to 70 c c, but did not disappear until the twentieth day There were no spirochetes in the sputum and the Wassermann reaction was also negative Becher thinks that it seems indicated to try arsphenamin injections further in similar cases

Arteriovenous Aneurysm Bernard —p 372
Nipple Clip to Prevent Loss of Breast Milk H Hinselmann —p 373
Intravenous Injection of Opaque Fluids W Hoffmann —p 373

Calcification of Arteries—Monckeberg emphasizes that from a pathologic and anatomic standpoint the calcification of the media in arteries of a muscular type is quite distinct from the disease process in atherosclerosis Both processes may, however, occur together, in which case atherosclerosis is grafted on to an existing calcification of the media, but even the advanced stages of calcification commonly show no associated atherosclerosis Since atherosclerosis of the terminal arteries is seldom so severe that the changes in the walls can be palpated through the skin it follows that the clinical finding of an artery with calcium deposits justifies the assumption of calcification of the media and that atherosclerosis may be associated It does not justify the conclusion that atherosclerosis alone is present The more pronounced the findings the more likely it is that only calcification of the media obtains

Tissue Defense—On the basis of investigations and clinical observations, Theilhaber and Rieger believe that atheromatous degeneration of blood vessels is conditioned not only by the kind and quantity of chemical substances in the blood but also by the state of tissue defense If the chemical poisons in the blood do not exist in too large quantities and the tissue defense is still reasonably efficient when a reduction of heart function in advanced years occurs only sclerosis will develop But on the other hand, if the poisons in the blood are very numerous and the tissue defense is defective, atheromatosis will result Sclerosis and atheromatosis in turn open the gates to invasion of the connective tissue by adjacent tissues (epithelium) They also prepare the way for many other diseases such as chronic arthritis They also break down the tissue defense A further important factor which impairs the tissue defense is the reduced activity of the blood-forming organs The spleen bone marrow, thymus, Pever's glands lymph glands etc, atrophy in old age in consequence of the reduced supply of blood circulating through them owing to the weakening of the heart action As a result there is a decrease in the round cell production, in the formation of connective tissue cells, a reduction in the tissue defense and a decrease in the antibodies acting against foreign invaders The meshes of the "filter" that protects the vessel walls against the invasion of toxins in the blood are unduly widened The functioning of the blood-forming organs is impaired also by the sclerosis and atheromatosis of their vessels and thus the vicious circle is established Impaired heart functioning due to old age is thus frequently the primary factor in the syndrome

Mechanical Irritation in Treatment of Adams-Stokes' Disease—Schott states that in attacks of Adams-Stokes disease heart action may sometimes be restored by a rather vigorous slap on the chest over the heart This may be done from five to ten minutes after the onset of the syncope He thinks that possibly patients may thus be tided over the time of gravest danger One blow with the fist may rouse the patient from his stupor or it may require several Two cases are cited

Investigations of the Question of Colds—Schade recalls that the skin is the main defense and protective organ of the body against the cold but strangely enough we scarcely ever speak of taking cold in the skin although the skin is just the place where disturbances of the tissues due to cold are best recognized The effect of the cold is first seen on the nerves In the vasomotors this is evidenced by the interruption of regular processes, in the sensory nerves a reduction in the specific skin sensations is noticeable "Aside from these changes a general physical alteration of the skin tissue takes place, a fact that in the past has been grossly neglected" He means the stiff and doughy condition of the tissues which is noticeable in the hands and face after staying a short time in the cold air Through the effect of the cold the tissues become harder and less elastic The change that occurs in the skin may be likened to the hardening process of certain jellies when exposed to the cold for in both cases it is the colloids that undergo a change As we learn from recent physiologic and clinical investigations, the changes in the colloids are of the greatest importance from the standpoint of cell functioning Every change in the colloid state causes disturbance of function After the colloidal change becomes permanent it is impossible for the cell to continue to exist in the normal manner There are several manifestations in the clinical course of catarrhal conditions that point to the cold as one of the etiologic factors responsible for these conditions The catarrhal conditions appear frequently within a few hours after exposure to cold When a mucosa is affected, at the beginning of the condition the whole surface is often affected at once, instead of first a small focus appearing, as is the case in ordinary infections

Tetragenus Infection—Lüdke finds in the literature very few cases reported in which a pure infection from *Micrococcus tetragenus* occurred He therefore gives an account of three cases of his own which he thinks justify the conclusion that this species is an independent disease-producing agent Its pathogenicity cannot be very great as all the cases took a favorable course In his three tetragenus cases he used intravenous injections of killed tetragenus cultures or an albuminoid product, which promptly reduced the fever and led to a speedy recovery of the patient In one case he had tried intravenous injections of collargol, but without success

*Treatment of Rachitic Curvature of Bones G Magnus —p 4
Pharmacology of Colchicum Treatment of Gout S Loewe —p 5
Practical Suggestions for Out Door Treatment of Tuberculosis Backer and Capelle —p 11

Rectal and Parenteral Feeding—Von Noorden asserts that the best means for artificial feeding is with the duodenal tube When this is not practicable, all that we can hope to get absorbed from a nutrient enema is water, a few salts alcohol of at least 3 per cent concentration, of the carbohydrates only dextrose or better yet dextrin, of nitrogenous food only albumose-peptone or products of far advanced splitting of albumin He advises not more than two enemas of 300 c c each in the twenty-four hours, the patient lying quiet thereafter The rectal tube is introduced for 8 cm and a preceding injection of a little opium twenty or thirty minutes beforehand is advisable By giving the enemas by the drop method up to 2 liters can be given in the twenty-four hours It is better to give the nitrogenous and the carbohydrate ingredients in separate enemas When the rectum

cannot be utilized, sugar can be given subcutaneously or by the vein and does not induce anaphylaxis, like albumin Fat by these routes is not assimilated Cane sugar and milk sugar are eliminated in the urine almost unutilized, dextrose and levulose are the forms to be used By the vein, a 5 or 10 per cent solution can be infused, subcutaneously only the 5 per cent solution This should supplant the old saline infusion as it supplies the needed fluid and nourishment besides It is indicated particularly, instead of saline, in uremia and cholera and can be combined with nutrient enemas When mineral salts are indicated Ringer's solution is preferable to saline but he omits the sodium bicarbonate as this causes turbidity Although the calcium content is minute, yet it may have decisive importance for the heart action He commends especially a combination of Ringer's solution and 10 per cent sugar solution

Treatment of Rachitic Deformity—Magnus utilizes the tendency of an immobilized bone to atrophy and soften This is accomplished by putting the deformed leg in a plaster cast without any attempt at correction The child is then kept in bed for five or six weeks When the cast is then removed, the bone is soft and pliable and can be straightened under general anesthesia as readily as a wax candle Another plaster cast is then applied for a second six weeks but weight bearing is now indispensable to overcome the tendency to atrophy It should be begun by the third week His results in thirty cases were highly satisfactory, usually both legs were treated at the same time In one child the femur fractured and had not quite healed so that a cast was necessary for an additional three weeks There has been no recurrence of the deformity in any case The cast reached to the ischium when merely the legs were in question, but with the thigh, the pelvis was included

Reinfusion of the Blood with Tubal Abortion or Rupture of the Spleen—Kulenkampff proceeds to reinfusion of the extravasated blood at once and has had no mishaps in the two cases of ruptured spleen and nine of tubal abortion in which he restored to the system the blood lost in this way, and he knows of thirty-five other cases on record In a twelfth case he found that the blood had coagulated The harmlessness of puncture has been demonstrated by the pneumoperitoneum technic and he punctures the abdominal wall in the lower third of the rectus muscle and aspirates to confirm the presence of fluid blood The infusion tube is introduced into the vein by the assistant as the abdomen is being opened The parietal peritoneum is then drawn up into a cone and the blood around the bladder runs out From ½ to 1 liter of fluid blood is thus secured in a few minutes, strained citrated and poured into the infusion funnel

Reinfusion of Blood with Tubal Abortion—Friedemann in critical cases, immediately exposes the vein and infuses physiologic sodium chlorid solution by the drop method When the abdomen has been opened and the bleeding artery clamped, the extravasated blood is scooped up and citrated with a 3 per cent solution of sodium citrate in the proportion of 9 1 Then the citrated blood is added to the saline and the mixture is infused as needed, but always very slowly When the blood has all been used he occasionally continues with pure saline He has been using this technic for several years and has never noted any signs of intoxication with it

*Signs of Calcium Deficit H A Stheeman and A F W Arntzenius—p 1030
Ideals of School Inspection M van der Heeve and others—p 1039
*Psychogalvanic Reflex Phenomena A A Grunbaum—p 1044

The Stigma of Calcium Deficit.—Stheeman is chief of the children's hospital at s Gravenhage and extensive experience has convinced pathologic conditions have the inadequate reserve of calcium

underlying cause responsible for spasmophilia, for the habitus asthenicus, universal asthenia and allied conditions That this fact has not been fully appreciated before is due to the lack of a simple and reliable quantitative test for the calcium content of the blood Wright's method reveals only the calcium that is dissolved, and there is no standard for comparison between the findings by different workers The De Waard method of microtitration with one-hundredth normal solution of potassium permanganate gives reliable findings with as little as 0 5 or 1 c c of blood or serum. (It was described in detail in the *Nederlandsch Tijdschrift voor Geneeskunde* 2 992, 1918) The findings in the blood serum of thirty-five sick children and in a number of healthy children and a few sick and healthy adults are tabulated In the fifty eight healthy children the calcium content was constantly between 12 and 13 mg per 100 c c of serum In the others it ranged from 8 25 to 17 mg The age does not seem to influence the calcium content, but an extremely low figure was found in the prerachitic condition, with intestinal infantilism, neuroses of the vegetative nervous system, universal asthenia, and tuberculosis The severity of the pathologic condition was reflected in the lowness of the calcium content, and the figure rose as the general condition improved A further proof of his theory is the prompt benefit in all these pathologic conditions when treatment aiming to promote retention of calcium, namely with cod liver oil and phosphorus, was systematically given To estimate the improvement he does not trust to personal impressions but measures it with precision by testing the sensitiveness of the peripheral nerves to the galvanic current This has confirmed that the Erb sign is nearly always positive with a low calcium content and is never positive with a high content (aside from rachitis) Also that the Erb sign is most pronounced the greater the deficit in calcium and that as the Erb sign becomes less pronounced, the calcium content is also found to be increasing It seems thus beyond question, he concludes that the cause is a local calciprivic condition of the nerve tissue, at least in the peripheral neuron as a part of a general deficit of calcium in the tissues It conforms to Quest's and McCallum's findings in dogs, and to the Chvostek sign in children The latter he regards as a more sensitive sign than the Erb reaction

Psychogalvanic Reflex Phenomena — Grunbaum's thirty-page article is a critical review of recent literature on the galvanometric measurement of mental processes and emotive physiological changes He is privat-docent of physiology at the University of Amsterdam and his conclusions are against the acceptance of psychogalvanic reflex phenomena as a reliable element in the diagnosis

*The Duodenal Tube with Gallstones A Tvilstegaard —p 257 Conc n

Duodenal Findings with Gallstones —Tvilstegaard found leukocytes in the duodenal content in 10 cases of cholecystitis On the other hand he never found leukocytes in the duodenal content from healthy persons The duodenal content resembled macroscopically microscopically and bacteriologically the contents obtained from the gallbladder at the operation In four of the five cases in which the colon bacillus was found in the duodenum it was present also in the gallbladder Injection of a solution of peptone into the duodenum is said to induce contraction of the gallbladder, and the outflow of bile is modified In some cases he noted that the bile thereafter became thick and dark colored but this cannot be ascribed to contraction of the gallbladder alone, as in one of the cases the gallbladder was completely destroyed and unable to contract In some other cases although the gallbladder seemed to be functionally capable, yet no effect from the peptone was apparent Investigation of the duodenal content is instructive for differentiation of disease of the biliary apparatus from kidney disease and appendicitis in puzzling cases Considerable literature is appended He has applied the method in 18 cases and gives the details of 11 cases in which the findings were confirmed by an operation

*Etiology of Chronic Gastric Achylia K Faber —p 505
*Polycythemia T F Hess Thaysen —p 514 Begun in No 15 p 473
*Cyst in the Brain A V Neel —p 524

Etiology of Chronic Gastric Achylia —Faber presents evidence to disprove the assumption of a congenital achylia and to demonstrate that in the majority of cases the nonfunctioning of the gastric glands is the result of toxic injury from endogenous toxins in the course of acute or chronic diseases or from gastro-intestinal infectious processes, or from irritation from insufficiently masticated food The direct hematogenous toxic action in typhoid and dysentery, entailing achylia was abundantly proved during the war. In bacillary dysentery there is frequently a toxic bradycardia In children achylia of toxic origin is common, but it is usually transient, in adults irreparable injury may result At all ages the achylia may develop without causing symptoms While the toxic action responsible for it is transient the glands may be damaged for life As the condition is proving to be so much more common than formerly supposed its occurrence in several members of a family cannot be accepted as indicating a congenital, familial condition, at least from the evidence hitherto presented

The Capillaries in Polycythemia with Enlarged Spleen — Thaysen says that if the erythrocytes were counted systematically over long periods in cases of polycythemia remarkable fluctuations in the count might be found, as in the case here reported in detail His patient was a woman of 54 and the erythrocytes ran up from 7 7 millions to 11 8 millions in the course of six weeks, but this was followed by a still more sudden drop to 7 2 millions in three and a half weeks In the course of twelve hours the figure ran up from 5 3 to 10 6 millions on one occasion His investigations and tests showed that the fluctuations were caused by varying contraction and dilatation of the capillaries, and precapillaries of the skin The vasomotor system is evidently in a very unstable state which might be called actual vasomotor or capillary ataxia This suggests the possibility of suprarenal insufficiency as an element in the clinical picture There is one case on record of associated Addison's disease and polycythemia In polycythemia there is usually a tendency to muscular weakness and pigmentation Guggenheimer has reported two cases of eunuchoidism plus polycythemia Thaysen adds that the experiences with roentgen treatment have been conflicting Vaquez noted general improvement but no action on the erythrocyte count, while McCray thinks it is the only dependable treatment, and Engelhardt and Brown denounce it as ineffectual Rydgaard has published a favorable report and Thaysen's own patient seemed to improve after the first two exposures, but later no effect was apparent

Cyst in the Brain —The apparently healthy woman of 76 developed severe chorea following a fright The chorea was ascribed to hysteria but it persisted with progressive dementia Necropsy the third year revealed an old subdural cyst behind a depression in the frontal bone from a fall

PRINCIPLES OF PERIPHERAL NERVE SURGERY *

DEAN LEWIS, M D

CHICAGO

Notwithstanding the amount of experimental work that has been done on peripheral nerves, there is still some difference of opinion among investigators as to their method of repair after injury or division The complex histology of the nerve fiber and the many different processes occurring or progressing simultaneously in both segments of a divided nerve offer many opportunities for widely different interpretation of findings If the essential features of nerve repair are understood, the factors that interfere with it can be easily determined by experimental studies or the examination of tissues removed at operation Therefore, before discussing the principles of peripheral nerve surgery, I will consider the regeneration of peripheral nerves after division

REGENERATION AFTER DIVISION

When a nerve is divided, definite evidences of regeneration are noted within a few hours in the proximal segment adjacent to the point of injury Some of these early changes are undoubtedly abortive, but others indicate attempts at definitive repair Some degenerative changes occur in the neuraxes in the distal end of the proximal segment These do not, however, extend far back in the nerve, probably only to the next node of Ranvier

Definitive regeneration of neuraxes occurs only in the proximal segment, and all the neuraxes that eventually neurotize the distal segment passing into the motor end plates and sensory endings develop from those of the proximal segment By the eighth day after division of a nerve, the medullated fibers of the proximal segment have given off numerous lateral rami some 5 mm above the point of section These grow distad beneath the old neurilemmal sheath The nonmedullated fibers also dissociate into bundles of neurofibrillae which grow down in the old sheaths by the fourteenth day In studying the repair of nerves through a gap, it can be positively demonstrated that no neurofibrillae can be found in the distal segment until those developing from the proximal segment have bridged the gap Some still ardently defend the theory of peripheral regeneration of nerves, but all recent evidence shows that the theory of peripheral regeneration is based on studies made when specific stains were not in use or on experiments which were imperfectly or insufficiently controlled

The changes that occur in the distal segment after division are equally important to those occurring in the proximal Nerve impulses cannot be transmitted without neuraxes, but the neuraxes cannot reach their terminal distribution unless bands or conduits are formed along which these can pass or creep Both degenerative and regenerative changes occur in the distal segment after division The neuraxes soon become broken up Often they seem to have snapped Later they break up into fine granules The myelin breaks up into balls and globules While these degenerative changes are occurring in the neuraxes and myelin sheaths, definite evidences of growth or repair are noted in the sheath cells The adult neurilemmal sheath (Schwann) is a fine, thin, structureless membrane provided with a few fusiform nuclei—one to each node of Ranvier, the latter varying from 80 to 900 microns in length

After division, the sheath cells of both the proximal and distal segments bordering on the traumatized area react early The first indication of a growth change is indicated by a slight increase in the granular cytoplasm surrounding the nuclei of the sheath cells This change is observed within from twenty-four to thirty-six hours after division in the cells immediately adjacent to the zone of injury The cytoplasm increases rapidly in amount, the nuclei undergo mitosis, and by the fourth to the sixth day definite protoplasmic bands have formed These are narrow strands or bands of protoplasm which contain hyperchromatic nuclei This growth change, leading to the formation of protoplasmic bands, occurs throughout the distal segment Certain factors, probably traumatic, greatly accelerate the process in those sheaths bordering on the line of division The fully formed protoplasmic bands appear later in the peripheral parts of the distal segment than in those adjacent to the line of division

These bands evidently play an important role in nerve regeneration, for the fibers which have no neurilemmal sheaths, such as those of the optic nerve and spinal cord, do not regenerate after division Kirk and Lewis, in studying regeneration of peripheral nerves after fascial tubulization, could demonstrate these bands passing through and bridging the gap They seemed to precede the developing neuraxes, forming pathways, as it were, for these as they developed The neuraxes—the conducting portion of the nerve fiber—develop only from the proximal segment after division of a nerve The changes in the neurilemmal sheath which occur throughout the distal segment and in the distal part of the proximal segment adjacent to the line of division—the so-called wallerian degeneration—are, however, essential to the definit

* Chairman s address read before the Section on Surgery General and Abdominal at the Seventy First Annual Session of the American Medical Association, New Orlean April 1920

tion of the nerve, for without protoplasmic bands, which develop as a result of regenerative changes in the sheath cells, the developing neuraxes do not reach their terminal connections

HARMFUL EFFECTS OF SCAR TISSUE

In the repair of a divided nerve, the first consideration is to provide easy access for the developing neuraxes to the distal segment After division of a nerve, a neuroma will develop within nineteen days Even when there has been no hemorrhage or infection a neuroma develops The cut fibers retract within the epineural sheath, and a connective tissue cap forms over the end of the nerve There is, however, a very marked attempt at repair, for the developing neuraxes as they reach the connective tissue, formed by the cells of the endoneurium and perineurium and surrounding tissues, turn back on themselves to form the spirals described by Perroncito The neuromas which invariably form after division of a nerve, as demonstrated by Huber and Lewis, are indicative of an attempt at repair which has been thwarted by scar tissue Some of the developing neuraxes may undoubtedly zigzag through scar tissue and reach the distal segment, but it is doubtful whether they will reach the terminal connections to which they were originally destined

Scar tissue forming after division of a nerve interferes most seriously with nerve repair There has been a tendency of late to advise suture by neuroma There will be but few successes when such a procedure is attempted In all cases the neuroma should be resected until healthy funiculi appear and to the point where scar tissue is not visible to the naked eye In many instances even after the neuroma has been resected far back, the funiculi will have a peculiar matted, gelatinous appearance This appearance is due to small amounts of young connective tissue, developing neuraxes and some edema The results which have been obtained after suture would seem to indicate that successful nerve repair may be obtained when end-to-end suture is made between funiculi having this appearance

In examining some neuromas which were resected when suture has been performed, connective tissue septums which equal in diameter the funiculi have been found In such instances, it would have been easy to approximate funiculi of the distal segment with connective tissue septums of the proximal segment, thus preventing or seriously interfering with nerve repair I believe it advisable in many cases to employ frozen sections to determine the level to which the resection of neuroma should be carried Mobilization of the nerve segments and preparation of the nerve ends followed by accurate adjustment require some time, and the frozen sections could be easily made and studied while these procedures were being carried out

NECESSITY OF PRESERVING THE NERVE PATTERN

Success in peripheral nerve repair depends on accurate anatomic approximation of the two ends The importance of the internal topography of peripheral nerves should be emphasized Stoffel has insisted that the funiculi in a mixed nerve have a fairly definite position and that the sensory and motor funiculi, which serve different muscles, maintain their position and relation throughout the entire course of the nerve He is probably incorrect in the belief that the funiculi maintain a fairly definite relationship throughout the entire length of the nerve, for Langley has demonstrated in peripheral nerves an internal plexus The internal plexuses apparently serve to collect together the afferent and efferent fibers of the different nerve roots for the areas supplied by the peripheral nerves, just as the brachial and lumbosacral plexuses do for the large areas supplied by the nerve trunks In the region between the origin of two successive nerves, not arising close together, the bundles are arranged in groups which have little or no connection with one another, although the bundles forming the group are more or less interconnected Such a region is called an intermediate region, but it gradually blends with the region in which is found the plexus which is formed by the interlacing of fibers or bundles given off from the nerves or bundles of the intermediate zone Langley's work agrees with that of Dustin, who described an interlacing of nerves or bundles between the funiculi of peripheral nerves at points where branches are given off

As far as the surgery of peripheral nerves is concerned, Stoffel's and Langley's work, although differing in detail, emphasizes the importance of nonaxial rotation of nerve trunks during suture, thus avoiding distortion of the nerve pattern Distortion of the nerve pattern may interfere seriously with the nerve supply of muscles If the nerve pattern is distorted, reeducation of muscles or readjustment becomes necessary If the nerve pattern is distorted, the developing neuraxes may not reach the muscles for which they were originally intended, or neuraxes which originally served motor function may be diverted to the skin In some instances after suture, even when care is exercised, the neuraxes may make proper functional nerve endings, but the central connections may be different from those existing before the suture was performed In such instances a readjustment of impulses or a degeneration of these fibers must occur before coordinated movements can be made

I have attempted without any great success to perform funicular suture This is the object to be desired, but I believe it impossible As perfect anatomic repair as is possible should, however, be secured in order to preserve the nerve pattern The surgeon who makes the most perfect anatomic repair will, other things being equal, have the greatest number of successes

It is often difficult to determine whether or not rotation has occurred or the amount of rotation, if such has occurred This is especially true when the nerve has been divided by a missile, for the nerve after division may be rotated or displaced by the force continuing to act When the nerve is exposed, fine silk sutures may be inserted on both sides of the nerve before it is lifted from its bed These serve as guides to determine the exact position of the nerve segment when suture is attempted Mosquito forceps may be used for the same purpose, but they are not so easily handled and may cause more injury to the nerve

If, after suture, fibers originally destined for a certain group of muscles become partly distributed to their own group and partly to those of another group, marked incoordination of movements may occur The movements are then no longer precise They are awkward and without force This is often seen after suture of the radial nerve, when the supinator longus contracts more forcibly when attempts are made to use the extensors of the wrist, than when the forearm is flexed on the arm In this instance some of the fibers which

should have been distributed to the radial extensors have reached the supinator longus

Accurate approximation will prevent to a great extent this imperfect redistribution of developing neuraxes An imperfect redistribution occurs to some slight extent after every suture, but the results are overcome by reeducation or some degeneration of the fibers which have made wrong terminal connections

IMPORTANCE OF EARLY SUTURE

The length of time intervening between the division of the nerve and repair is the third important factor in determining the success of nerve suture Those cases in which nerve suture is performed early, in which the period between the injury and the operation does not exceed three or three and one-half months, have a much higher percentage of recoveries than those in which the suture is performed later Some time ago I reviewed the statistics of nerve suture, and it seemed to me that suture performed as late as nine months after the injury presented a much lower percentage of recoveries than suture performed earlier

I have had the opportunity of observing eleven cases in which primary suture was performed Nine months after suture, nine of these presented definite evidence of return of motor function These cases could be spoken of as cured The importance of the time element cannot be emphasized too strongly, for there is a tendency in civil practice to delay operation in hopes that improvement may occur if massage, electricity, etc , are continued long and faithfully Supplementary movements which are not dependent on regeneration of the injured nerve are often regarded as evidences of recovery These movements should be carefully studied, for operative interference should not be delayed because of the mistake of interpreting these movements as evidence of return of function in the paralyzed group of muscles Early exploration is advisable in many of these cases, for the secondary changes occurring in the nerve often render suture difficult after a delay of many months, and the changes which occur in the muscles, tendons and joints may cause more or less permanent disability

END-TO-END SUTURE

I have wished to emphasize the harmful influence of scar tissue on nerve regeneration, the necessity of preserving the nerve pattern, and the importance of early suture These are important things in peripheral nerve surgery The method of applying the suture in end-to-end anastomosis is simple

End-to-end suture is the only procedure that can be relied on to reestablish the continuity and function of a nerve after division It makes no difference concerning the suture material, for fine silk or catgut gives equally favorable results Transfixion sutures do not seem to disturb the nerve pattern, but I believe that epineural sutures are the most satisfactory In cases in which some traction must be exerted, it may be necessary to employ one or more transfixion sutures

The sutures should be applied so that the epineurium is closed, thus preventing straying of neurofibrillae in surrounding tissues The ends should be approximated without pressure It has been advised by some that a small gap be left I believe that this is poor advice, although one can see the reason for it after examining neuromas which have been removed when the suture was performed In some cases the scar tissue surrounding a funiculus equals in diameter the funiculus itself In such cases it might be difficult to avoid approximation of the funiculi in one segment with the scar tissue in the other If a small gap were left it might be easier for the neuraxes to find their way into the protoplasmic bands of the distal segment Resection of the neuroma far enough back to expose healthy neuraxes is necessary if peripheral nerve suture is to be successful

Mobilization of the segments will often permit of end-to-end suture even when the defect is long, especially when combined with displacement of the nerves and change in the position of the part Dissection of a nerve from its bed apparently does not interfere with regeneration, for recovery within the time expected after suture occurs when, for example, the sciatic is dissected out of its bed for considerable distance As one's experience in peripheral nerve surgery increases, the attempts at end-to-end suture even in long defects become more and more successful In the cases in which the defect is so long that end-to-end suture is impossible, many procedures have been suggested No one of these can be depended on to give results

CABLE TRANSPLANTS

Experimentally, auto and homo-cable transplants will conduct neuraxes from the proximal to the distal segments Fascial tubes can also be used with success experimentally

The results obtained by Platt in clinical surgery when these procedures are employed are not encouraging They suggest either that the results obtained experimentally cannot be applied directly to clinical surgery or that our technic is at fault in this work

Platt's conclusions are as follows

1 In eighteen operations in which fascial tubulization combined with autogenous nerve grafts, fascial tubulization alone and autogenous vein tubulization (one case) were used, there was a complete absence of any clinical sign of recovery The shortest period over which observations were made was four months, the longest period twenty-six months

2 Secondary exploration in four cases showed complete silence of the nerve trunk to direct faradic stimulation End-to-end suture was accomplished in all after exsection of the bridged segment

3 At the reexploration operations, partial or complete obliteration of the lumen of the fascial tube was noted

4 In two specimens examined histologically, one, a tubulization alone, showed obliteration of the lumen of the tube by fibrous tissue in which no nerve fibers could be found In the second, a graft and tubulization combined, nerve fibers were present in the center of the obliterated tube eighteen months after the operation There was no sign of continuity between the proximal and distal ends through this strand of nerve fibers

5 The early reexploration of all graft and fascial bridge operations is advisable

In 120 operations I used auto cable transplants twelve times and performed tubulization with fascia six times In none of these has there been recovery, although in two transplantations there has been some slight return of motor power in isolated [illegible]cles The striking thing, however, is [illegible] increase markedly in size

should be explored after a reasonable time as a block to the developing neuraxes may occur at the junction of the transplant and the distal segment Resection and suture at this point might favor the downgrowth of neuraxes and neurotization of the distal segment

PROCEDURE WITH PHYSIOLOGIC INTERRUPTION

The group of nerve injuries in which there is no anatomic division but a physiologic interruption of nerve impulse offers some interesting problems The pathology varies considerably Constricting bands, thickened epineurium, bony callus and cicatricial nodules within the nerve resulting from intraneural hemorrhage and proliferation of intraneural connective tissues are the conditions most frequently found

Not all are agreed as to the procedure to be followed In some cases, however, the indications are well defined Tinel has stated that neurolysis is permissible only when it restores a free, supple nerve, in the interior of which is found no obstacle to regeneration, and that as a whole liberation is ineffective in cases of severe lesion of nerve trunks associated with rupture of the sheath, and the development of scar tissue with the formation of a neuroma In these cases the cicatricial tissue is either permeable to regenerating axis cylinders, in which case intervention is useless, or the obstacle does not permit of the passage of axis cylinders, and an operation such as neurolysis will not make it permeable Neurolysis is of distinct value, but it is sometimes difficult to determine whether or not the results are the direct results of surgical intervention, for many of the patients recover spontaneously The value of the operation cannot be denied, however, in those cases in which paralysis has existed for months and in which a distinct return of motor power occurs within ten days following the operation Nerves which present the least macroscopic change may have the greatest alteration in or suspension of function This is observed especially in those cases in which a number of nerves, some of which have recovered spontaneously, have been affected When the operation is performed it may be found that the nerves presenting the most marked pathologic changes are the ones that have recovered spontaneously

Whether neurolysis or resection is to be performed depends on the appearance and feel of the nerve and the electrical reaction The time element is important in determining the results after neurolysis, that is, the time existing between the injury and the operation Statistics dealing with a large number of nerve injuries compiled by a number of different surgeons indicate the importance of the time element The greatest number of improvements, from 80 to 100 per cent, are noted in cases in which this operation is performed within five months after the injury When the operations were performed eight or nine months after the injury, improvement was noted in but from 30 to 70 per cent In thirty-nine cases in which neurolysis was performed within six months after the injury, improvement was noted in 58 9 per cent, while in 100 cases in which a year had elapsed before the operation, improvement was noted in but 28 per cent Patients operated on ten months or more after injury had the lowest percentage of improvement There is, however, no relation between the amount of improvement and the time at which it begins after this operation, for many of the patients who improve the most are those who begin to improve some time after operation

Endoneurolysis, in which the separate funiculi are exposed and freed of scar tissue, is technically somewhat difficult While there may be no increased disability as the result of such an operation—even some improvement—the end-results are usually not much of an improvement over the condition existing before the operation, for scar tissue tends to reform within the nerve

Neurolysis is frequently combined with capsulectomy —removal of the thickened epineurium—or parallel incision of it Injection of the nerve with a solution of procain, as suggested by Hofmeister, is employed by many now in preference to endoneurolysis

A number of methods have been suggested to prevent the reformation of scar tissue after neurolysis Whenever possible, and it is possible in the majority of cases, the liberated nerves should be placed between uninjured muscles Even in large wounds with a great deal of scar tissue it is possible to displace muscles so that a new bed can be formed for the liberated nerve Liberated nerves should not be placed in contact with cut muscle fibers, for the adhesions which then form may seriously interfere with the conduction of the nerve impulse

Cargile membrane is the next choice Fascia cannot be used for this purpose to advantage, for when placed in contact with scar tissue it becomes invaded by and converted into scar tissue I have reoperated in three cases in which a free fat transplant has been used for neurolysis The fat had disappeared from all, and in the place of the transplant were adhesions These were delicate, but delicate adhesions frequently seriously interfere with nerve conduction

RECOVERY OF FUNCTION

Following suture, nerves recover function in a fairly definite order as regards time The musculocutaneous nerve in the arm recovers rapidly and completely The musculospiral nerve recovers early Distinct return of motor power in the supinator longus and radial extensors of the wrist is frequently observed within five and a half months after suture Seventy per cent of the cases of musculospiral suture present very definite evidences of recovery when followed for some time Favorable results are obtained after suture at almost any level The results are not dependent on whether the nerve is sutured above the clavicle, just above its entrance into the radial groove on the inner side of the arm, or on the outer side of the arm between the supinator longus and brachialis anticus The internal popliteal (tibial portion of the sciatic) comes next in order of frequency and rapidity of recovery A longer time is required for recovery than after suture of the musculospiral Thirty-three per cent or slightly more recover fair function after six months At the end of nine months, 66 per cent may present definite evidences of return of function The median nerve repairs fairly rapidly and comes next in order Contractures of the thumb and index fingers with accompanying joint changes may seriously interfere with complete restoration of function and prolong disability In my experience the external popliteal recovers most slowly after suture Even those patients on whom the suture is performed low down recover slowly A large percentage do, however, recover after some time I have observed one case of external popliteal suture in which return of function (motor) was fairly complete at the end of six months

Peripheral nerves have great regenerative power The procedures that are necessary to the establishment of repair are plainly indicated by clinical and experimental studies and the histologic examination of specimens Changes occurring in muscles and joints which develop during repair unless prevented or corrected will defeat the purpose of the operation Careful and assiduous after-treatment is necessary There should be the closest cooperation between the physiotherapist and the surgeon Nerve injuries occurring in civil practice should be operated on earlier than they are Time is lost waiting for evidences of return of function Secondary changes occurring in the nerve during this time may render the operation difficult, often unsatisfactory, and the changes which occur in the muscles and joints may increase and prolong the disability

Early exploration after nerve injuries with loss of function of the muscles supplied by the nerve affected is advisable, for the condition of the nerve (anatomic division or physiologic interruption) can be determined and steps taken to promote an early return of function Results in nerve surgery grow progressively worse with delay

CLINICAL EXPERIENCE WITH A STANDARDIZED DRIED AQUEOUS EXTRACT OF DIGITALIS *

HOWARD F WEST, M D
LOS ANGELES
AND
JOSEPH H PRATT, M D
BOSTON

That digitalis to be effective must be given in sufficient dosage to produce demonstrable effects has been well known since the original directions for the use of the drug were given by Withering How far short of these instructions the general profession had fallen is a sad commentary Chiefly through the work of Eggleston,[1] it has been demonstrated that within reasonable limits the amount of digitalis necessary to produce physiologic effects can be calculated on a basis of the patient's weight, and that the administration can be carried on rapidly up to this point Robinson [2] has gone a step farther and has shown that under proper control this calculated amount of digitalis can be given in a single dose and effects obtained in from twenty-four to thirty-six hours that under the ordinary methods of administration would require from five to six days or even longer Those who have witnessed the remarkable effect of a large single dose of digitalis when given to a patient with acute symptoms of heart failure must have been impressed with the great value of rapid digitalization as a time saver to the patient and to the clinic

In order to give digitalis properly and especially rapidly, it is essential that the potency of the preparation in use be known It is to be hoped that soon physicians generally will prescribe digitalis in terms of physiologic units, instead of the usual drops, cubic centimeters or grams One immediately encounters the difficulty of obtaining preparations of constant or even known strength Few clinicians have available the material or skill for assaying the drug they must use in so many important cases The Pharmacopeia has set a standard for the minimum activity of acceptable leaf, yet this does not solve the problem entirely, since wide variations in potency are found above this minimum required [3] In spite of this requirement, much of the digitalis on the market today is below standard, while occasional samples are found considerably above the pharmacopeial strength It is further difficult to judge without making actual assays how much the original leaf or the preparation may have deteriorated in strength before the drug comes into the hands of the physician

In an effort to meet this problem, one of us has developed in the laboratories of the Harvard Medical School a preparation which has been used in the treatment of cardiac patients in the medical wards of the Peter Bent Brigham Hospital and in private consultation work for the last year It is a dried, aqueous extract, prepared essentially as follows A 1 per cent infusion is made and filtered and immediately evaporated to dryness over a water bath at a temperature not exceeding 80 C The residue is a fine brown powder that is easily handled It is quite deliquescent, but with care can be kept perfectly dry Each lot is tested for potency by physiologic assay For the most part the frog method has been used, the standard recognized by the Pharmacopeia The powder is mixed with anhydrous sodium sulphate in amounts depending on the strength of the original leaf, never using more than equal parts This in no way detracts from the usefulness of the preparation, and materially aids in preserving dryness It is then made up to weight if necessary with lactose so that 1 gm of the final product represents 1 gm of a leaf of pharmacopeial strength, that is, 0 6 mg per gram of frog weight is just sufficient to cause systolic standstill of the heart in sixty minutes The powder is most conveniently dispensed in capsules of 0 1 gm each The capsules protect the patient from the bitter digitalis taste, and also aid in protecting the powder from moisture, thus contributing to its stability The oldest sample has maintained its activity for a year This gives, then, a stable preparation of constant potency of pharmacopeial standard It should be emphasized that the preparation must be kept dry It has been found that if the extract is allowed to take up moisture, it may show marked deterioration in three months' time

The extract has been given to fifty-five patients under all the varying circumstances seen in the medical wards of a general hospital The results, judged on the basis of digitalis medication in general, have been uniformly satisfactory Whenever practicable for purposes of this study, the patients entering because of symptoms of heart failure were put at absolute rest and given the advantage of all therapeutic procedures excepting digitalis This was withheld until the

patient seemed to have reached more or less of a level of improvement, or persisting or increasing symptoms made it seem unwise or unfair to withhold the drug longer If it could be definitely ascertained that he had not been receiving digitalis within three weeks or more before coming to the hospital, massive doses, in the majority of instances single doses, of the extract were given It was soon found, by giving divided doses rather rapidly, that 30 mg per kilogram of body weight very closely approximated the dose from which physiologic effects might be expected With those patients to whom it seemed unwise to give large doses because of previous digitalis medication or doubtful histories in this regard, the usual method of giving repeated small doses was employed The usual effect, consisting of gradual slowing of the heart in fibrillating cases, gradual loss of edema, etc , was seen In many instances the total amount of the drug required was larger than the calculated dose In general, the amount in excess seemed to depend on the rapidity of administration Pardee [4] has estimated that with one particular tincture, 1 5 c c of which equaled 1 cat unit, there was a daily elimination or destruction equivalent to 1 5 c c We have not made as yet definite studies with this point in mind That more digitalis is required when given slowly was well illustrated in one patient with auricular fibrillation who had no toxic symptoms and but moderate effect on the heart rate when the calculated dose was given slowly Some weeks later the same amount of digitalis given as a single dose produced not only a marked slowing of the heart, but in addition considerable nausea with vomiting

Case 1 shows very well the typical response to repeated small doses in a patient with auricular fibrillation Here may be seen the gradual slowing of the heart with reduction of the pulse deficit and gradual loss of weight The digitalis was given over a period of six days The calculated physiologic dose would be approximately 2 7 gm He actually received 4 2 gm , which was followed by rather marked nausea and vomiting, indicating that the amount given was somewhat in excess of the optimum dose The effect, as judged by the heart rate, persisted for fully twenty days after the drug was discontinued

Case 2 shows a similar effect, though the administration was not carried to the point of vomiting This patient, also with fibrillation of the auricles, was given 1 gm of the extract during the first twenty-four hours after admission, without a preliminary rest It was then continued in smaller doses over a period of ten days until a total of 4 2 gm had been given During the first five days he received 3 4 gm , 1 1 gm in excess of the calculated dose that would have been expected to be effective if given at once This case illustrates very well an effective method of giving digitalis in practice when the patient is not under constant observation

The records of twelve patients showing fibrillation of the auricles who received effective large doses on a single day were selected as having been sufficiently well controlled to make comparison of value, and because in these patients the changes in heart rate give such good objective evidence of digitalis effect The average total dose varied from 1 4 to 2 2 gm The dose per kilogram of body weight, calculated on the lowest weight of each patient as obtained after the disappearance of edema, varied from 27 to 38 9 mg , with an average of 30 4 mg These results are tabulated herewith Taking 30 mg per kilogram as an average therapeutic dose, it is seen that in this series the variation was slight, within 10 per cent in all cases but one, in which the large dose, 38 9 mg , was approximately 30 per cent above the average

It is of considerable interest to note that while the standardization was originally done by the frog method, the preparation was also tested on cats through the kindness of Dr S A Levine, who found that the minimum lethal dose was 0 095 gm per kilogram of cat weight Converting the foregoing therapeutic dose, 30 mg per kilogram of body weight of patient, to cat units per pound, the Eggleston standard, the value is 0 145 unit Eggleston [1] found in his series an average of 0 146 cat unit per pound and recommends the standard dose of 0 15 unit, the dosage used by Robinson [2] in the series recently reported by him The agreement is especially striking since the standardization of our preparation by the cat method was done late in the course of the observations, and the first use of the value was made in computing these end-results

Case 3 is a good example of a single physiologic dose in auricular fibrillation Here is seen a large pulse deficit completely and persistently eliminated in twenty-four hours The patient came in complaining of nausea, a symptom that did not recur after the digitalis became effective No further digitalis was required while the patient was in the hospital

[1] Pardee H E B Notes on Digitalis Medication J A M A 1822 (Dec 13) 1919

Case 4 shows a similar effect, but illustrates the rapidity of action Here an initial slowing is seen in four hours, and complete elimination of deficit in twelve hours

While in no condition is the effect on the pulse rate so strikingly seen as in patients with auricular fibrillation when after a single physiologic dose initial slowing may be seen in from three to six hours and maximum slowing within twenty-four hours, still there is little doubt in the minds of most clinicians that much good can be expected from proper dosage in patients showing regular rhythm when their symptoms are evidence of heart failure We have had the opportunity of giving large doses of digitalis to a number of patients with regular hearts, using the same basis for calculation as in the cases mentioned above In many the effects were quite as gratifying as in those showing auricular fibrillation The average dose was the same

This raises the question of evidence by which one may judge the beneficial effect of digitalis therapy In patients with fibrillation of the auricles a marked slowing of the heart rate, especially the rate as counted by the stethoscope, and the reduction of the pulse deficit is one of the most striking phenomena in clinical medicine When the rhythm is regular, however, marked slowing is not to be expected, and frequently the rate remains but little changed In these patients an increase in the pulse pressure, due chiefly to a lowering of the diastolic pressure, is characteristic during the height of the digitalis effect, but is frequently temporary

That patients may show a spontaneous diuresis on being put at rest is frequently noted It is, therefore, occasionally difficult to be sure just what part digitalis plays in this increase in fluid elimination Many times, however, the diuresis follows the administration of digitalis in so evident a manner that little doubt can be felt as to the stimulus given by the drug At times a profuse diuresis may start within six hours after giving the full single dose of digitalis, as was well illustrated in Case 5 Here the digitalis was given at 10 30 a m The diuresis began late in the afternoon and continued throughout the night, so that the patient was voiding practically every half hour With or without a diuresis the patients may show other evidence of rapid improvement, such as lessened dyspnea, improved color, ability to sleep, and generally increased comfort The electrocardiograph will practically always show the effects of sufficient dosage of digitalis within twenty-four hours or less The chief evidences of this are the well known increase in P-R time and changes in the form of the T waves

There is one evidence of cardiac efficiency on which we wish to lay especial stress, and that is changes in the vital capacity of the lungs Peabody [6] and McClure and Peabody [7] have shown that in patients with symptoms of heart failure the vital capacity may be greatly reduced, that from a mechanical standpoint, dyspnea seems to be due to the inability of the patient to take in sufficient volumes of air to meet his physiologic requirements without considerable effort As it has been expressed, his "pulmonary reserve" is reduced Making allowance for age, sex, height and anatomic defects, changes in the vital capacity, especially changes seen in the same individual from time to time, give perhaps the most sensitive objective measure of the circulatory condition, and especially in regard to the tendency to dyspnea Lowering of the vital capacity has frequently been observed to precede obvious symptoms of cardiac failure On the other hand, as the patient improves, a corresponding increase in the vital capacity may be expected This test has proved of considerable value in judging the effects of digitalis, especially in those patients with regular rhythm when the heart rate changes are slight Increases of as much as from 400 to 500 c c, or from 15 to 20 per cent, have been seen in a number of instances in the first twenty-four hours after the physiologic dose, while the records during the preliminary rest period may show but little variation Illustrations of prompt increase in the vital capacity are seen in Cases 5, 6 and 7 Conversely, it is felt that if the vital capacity is low and does not increase during treatment, the prognosis for recovery is poor This is illustrated in Case 8, in which in spite of a satisfactory and prompt effect on the heart rate, the vital capacity remained low and the patient was but little improved It was necessary to transfer her to a hospital for chronic cases for continued care

That any active digitalis will produce nausea and vomiting by its effects on the central nervous system, if pushed but slightly beyond the maximal therapeutic point, is well known Consequently, no claim is made as to the freedom from toxicity of this preparation When large doses of digitalis are being used, occasional symptoms of this character are to be expected, for without doubt there is some individual variation in susceptibility to digitalis While the effects of toxic doses are distressing to the patient and to be avoided if possible, really dangerous symptoms are not seen if one knows the strength of his preparation and uses ordinary judgment

That not all patients with heart failure will be obviously benefited by digitalis is admitted These fall roughly into two groups (1) those in whom the cardiac condition has progressed beyond the point at which they can be truly benefited by any therapeutic procedure, and (2) those with cardiac lesions, but in whom because of rest and other therapeutic measures all symptoms of failure have disappeared A third group, perhaps, should be added including certain patients in whom the effectiveness of digitalis cannot be demonstrated but who respond to rest prolonged for weeks or months It is true, however, that in patients with auricular fibrillation, digitalis is of service in maintaining a slow heart rate and thus aiding greatly in protecting the patient from a recurrence of symptoms

Case 9 is a record of a patient with a regular heart who, as a result of rest in bed, Karrel diet, etc, had lost practically all her symptoms, one of the most conspicuous of which was a distressing cough Her vital capacity had increased in thirteen days from 1,725 to 2,400 c c On her thirteenth day in the hospital she was given the calculated dose for her weight, 1 7 gm of the extract In this instance nausea and vomiting were produced, the nausea persisting for two days During this period there was actually a fall in the vital capacity, which gradually returned to the previous highest point It is of interest to note that at the height of the digitalis effect the heart rate at one time was 48 per minute, though there was no evidence of

5 Christian H A Digitalis Therapy Satisfactory Effects in Cardiac Cases with Regular Pulse Rate Am J M Sc **157** 593 (May) 1919
6 Peabody F W Cardiac Dyspnea Am J M Sc **155** 100 (Jan) 1918
7 McClure C W, and Peabody F W Relation of Vital Capacity of Lungs to Clinical Condition of Patients with Heart Disease J A M A **69** 1954 (Dec 8) 1917

dissociation No direct benefit from the digitalis could be observed

Case 10 is a similar record of a patient with auricular fibrillation and hypertension While entering with considerable edema and some dyspnea, these symptoms disappeared with rest and other treatment It is to be noted that the pulse was originally slow without deficit He had a marked diuresis beginning on the sixth day

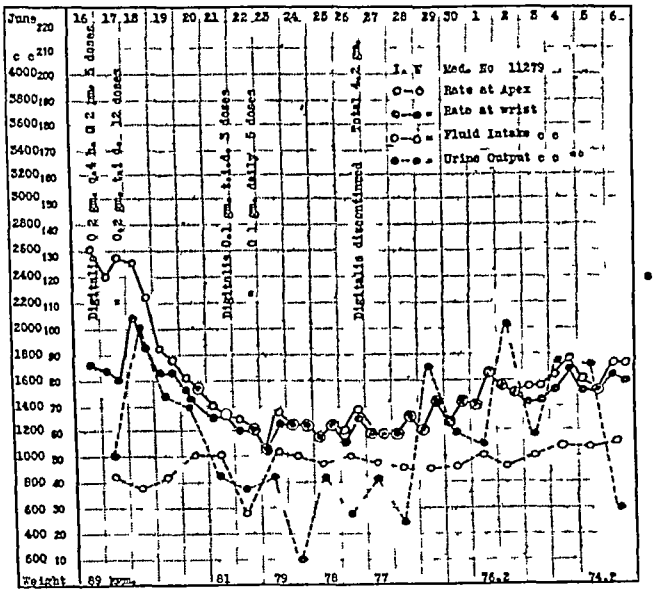

Chart 2—Effect of digitalis in Case 2

n the thirteenth day he was given 2 gm of digitalis, and the calculated dose was completed on the fourteenth day, making a total of 2 4 gm There was an initial fall in the systolic blood pressure and a more persistent lowering of the diastolic pressure Objectively there was no marked improvement in the patient's general condition, though the vital capacity was increased by 200 c c during the next four days

These cases are reported, not to detract from the value placed on digitalis as a great therapeutic agent, but to emphasize the point that it should be expected to show its usual beneficent effect only when the patient has symptoms due to heart failure in the broad meaning of the term

In practice, in order to avoid the nausea that occasionally follows large doses of digitalis, it is well to give at the first administration—if the patient has not had digitalis within two weeks—0 4 gm less than the calculated dose If in twenty-four hours satisfactory results have not been obtained, the remainder can be given Another method of value is to give at the first administration from 0 4 to 0 6 gm less than the calculated dose, and then after twenty-four hours to give 0 2 gm every six hours until indications for discontinuing the drug are seen Occasionally somewhat more than the calculated amount will be necessary Eggleston [8] has recently discussed the use of digitalis in large doses in detail

CASE ABSTRACTS

CASE 2 (Med No 11279 Chart 2) —A Russian Jew aged 53 admitted, June 16, 1919 with the diagnosis of chronic myocarditis auricular fibrillation tabes dorsalis and syphilis complained of shortness of breath He spoke little English and details of the history are incomplete He had apparently had no previous cardiac symptoms The present illness began five weeks before with dyspnea, and he had to stop work three weeks before coming to the hospital Since then he had been orthopneic, and one week before admission his feet began to swell The pupils were irregular, of unequal size, and fixed to light The deep reflexes were all absent The heart was markedly enlarged and absolutely irregular There was definite but not extreme Cheyne-Stokes respiration There was evidence of fluid at the bases of the lungs and considerable edema of the feet and legs The liver was somewhat tender The blood pressure was systolic, 128, diastolic, 84 An electrocardiogram revealed auricular fibrillation and left ventricular preponderance The Wassermann reaction was *positive in the blood and spinal fluid* in which there was also pleocytosis of 46 cells and a positive globulin test The weight on admission was 89 kg The lowest weight was 74 2 kg

On the day of admission, 0 2 gm of the extract of digitalis was given every four hours for five doses This was followed by 0.2 gm three times daily for twelve doses 0 1 gm three times daily for three doses, and 0 1 gm daily for five doses making a total of 4 2 gm in eleven days The calculated dose on the basis of lowest weight was 2 2 gm

The patient showed a gradual but steady improvement, with disappearance of dyspnea and loss of weight The pulse deficit had disappeared on the fifth day

CASE 3 (Med No 12711, Chart 3) —An American clerk, aged 54 admitted Jan 13 1920, with the diagnosis of chronic myocarditis and auricular fibrillation had first entered the hospital in February, 1919 complaining of shortness of breath He had had occasional attacks of rheumatism when a boy and frequent tonsillitis He was refused life insurance thirty years before because of a "leaky heart" A year previous to his first entrance he began to suffer from dyspnea, which increased particularly after he had influenza He also developed edema He had short attacks of precordial pain—not altogether typical of angina pectoris The heart was enlarged and absolutely irregular There was moderate edema of the extremities and Cheyne-Stokes respiration He left the hospital feeling very well and had been taking digitalis in small doses until one month before the second admission He had worked in a postoffice up to this time (one month before) when he stopped work because of loss of strength and nocturnal dyspnea He was also troubled with nausea and vomiting, which he attributed to digitalis, and he had not taken any for the preceding four weeks, though the nausea had continued

On admission he was able to lie flat in bed, but there was definite periodicity in his breathing The heart was enlarged

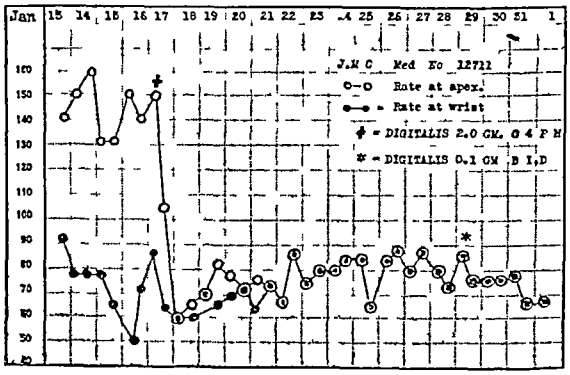

Chart 3—Effect of digitalis in Case 3

with a loud systolic murmur heard over the precordium The action was absolutely irregular There was a large pulse deficit of from 50 to 60 beats per minute An electrocardiogram revealed auricular fibrillation and some preponderance of the left ventricle The patient s weight on admission was 73 6 kg , lowest weight 70 4 kg The calculated dose on the lowest weight was 2 1 gm

8 Eggleston Cary Administration of Digitalis by Eggleston Method J A M A. 74 733 (March 13) 1920

The patient's condition remained unchanged until the fifth day, when he was given 2 gm of the digitalis extract at 4 p m An initial slowing of the heart was noted in four hours In twelve hours the rate was 60 a minute, without deficit Two hours later he was given some magnesium sulphate, after which he vomited There was no other evidence of toxic effect Improvement was continuous from this time, with no recurrence of nausea and vomiting which was complained of on admission He had had some nausea during the five days of rest before digitalis was given

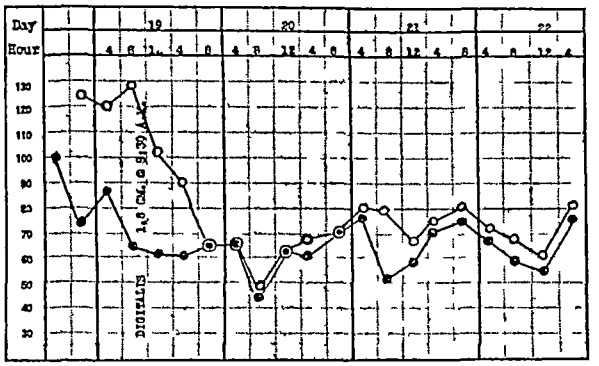

Chart 4 —Effect of digitalis in Case 4

CASE 4 (Med No 12296 Chart 4) —An American "matron" aged 55, admitted Nov 18, 1919 with the diagnosis of chronic myocarditis, auricular fibrillation, mitral stenosis and syphilis, entered the hospital for the sixth time for cardiac symptoms She had had rheumatic fever at 17 There were several miscarriages following the first child The Wassermann reaction was positive Cardiac symptoms began in 1914 The auricles had been fibrillating since 1915 She had been discharged from her fifth admission fifteen months before Since then she had been able to work part of the time The present illness began six weeks before admission with weakness and dyspnea She had been in bed nine days with dyspnea, "fainting attacks' and edema of the legs She appeared acutely ill with marked cyanosis, jaundice and dyspnea The heart was enlarged absolutely irregular, and rapid, with a deficit of about 40 beats a minute There was a loud systolic murmur heard over the precordium most marked at the apex Rales were heard over the bases of both lungs There was marked edema of the extremities She was mentally confused The patient's weight on admission was 75 6 kg , lowest weight, 60 kg

Because of the severity of her symptoms she was given 1 8 gm of digitalis extract at 9 30 a m on the second day At that time there was a pulse deficit of 35 beats a minute Though she was reported to have vomited about half an hour after receiving the digitalis at 8 p m the heart rate was 60 without deficit The initial slowing was noted in four hours All symptoms were improved, and she lost 6 6 kg in weight in five days On the eleventh day because of increase in the heart rate and slight gain in weight she was given 0 2 gm of digitalis three times daily for six doses Following this the heart rate averaged 70 a minute with very slight deficit during her stay in the hospital and improvement was continuous

CASE 5 (Med No 12093) —A Russian Jew aged 44, admitted, Oct 22 1919 with the diagnosis of chronic myocarditis, hypertension and arteriosclerosis, complained of dyspnea nocturia and insomnia The first attack of dyspnea occurred three years before while he was walking It was said that he had a blood pressure of 190 at that time During the last two years he had been troubled with pain in the arms on exposure to cold Nine months before he was told by his physician that he had kidney trouble, and rest in bed was advised There was nocturia during this time and for a month before admission it increased markedly The patient was pale and adipose with slightly cyanosed lips enlarged heart with loud systolic murmur a systolic blood pressure of 206, diastolic 140 evidence of edema at the bases of the lungs and slight edema of the lower legs The breathing was shallow and regular The heart also showed distinct gallop rhythm and pulsus alternans was present The rhythm was regular The rate was between 90 and 110 The patient's weight on admission was 81 kg , lowest weight in hospital 79 kg October 23 the vital capacity was 1 950 c.c., on the 24th 2 200 c c On the 26th the blood pressure was systolic 188, diastolic, 130 Pulsus alternans and gallop rhythm were present On this day the patient was given 2 5 gm of the digitalis extract without toxic symptoms On the 27th the vital capacity was 3 100 c c , blood pressure systolic, 194, diastolic, 116 Alternation and gallop rhythm were not present From this time on there was a steady improvement with an increase of the vital capacity to 3 600 c c Blood pressure on discharge was systolic, 176, diastolic 106

The patient was admitted a second time March 3, 1920 (Med No 13089, Chart 5) After leaving the hospital he was able to be up and about for most of the time until the second week before admission Since then he developed cough, increasing dyspnea, marked edema and sleeplessness During this time he remained in bed Examination disclosed a more severe condition than on the previous admission Pallor had increased dyspnea was more evident, and there was excessive edema The heart gave the same findings except that alternation was not noted The liver edge was palpable 10 cm below the costal margin in the nipple line There were few crackling rales at the bases of the lungs Blood pressure was systolic 190, diastolic 130 The weight on admission was 90 kg , lowest in hospital 66 kg The vital capacity March 4, was 2,125 c c March 5, the blood

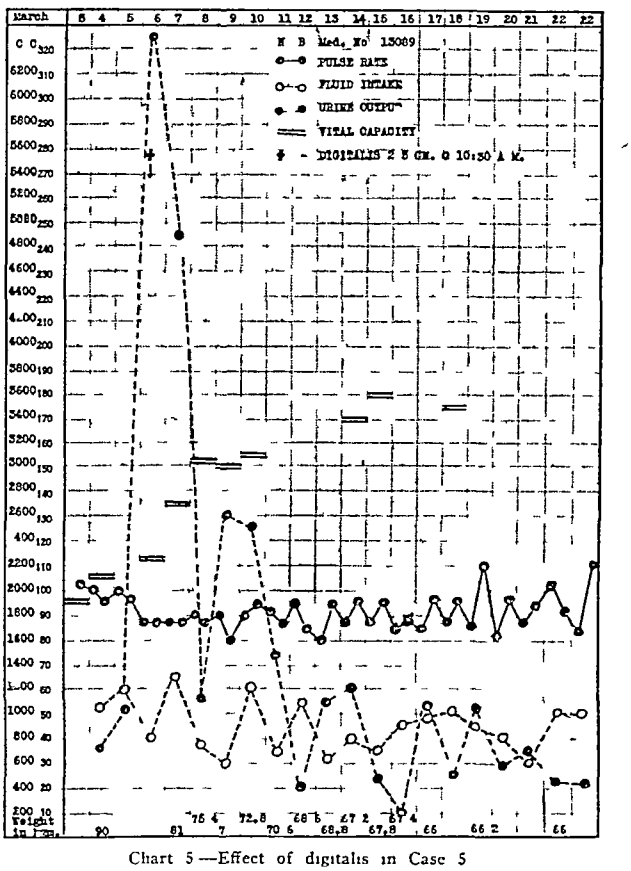

Chart 5 —Effect of digitalis in Case 5

pressure was systolic, 176, diastolic 130 March 6 the vital capacity was 2 250 c c Two small hemorrhages were discovered in the right retina As there was no definite improvement and the condition of the patient seemed serious he was given 2 3 gm of digitalis extract March 7 the note reads "Yesterday at 10 30 a m patient was given 2 3 gm digitalis His output chart shows that no urine was voided from 7 a m

to 12 55 p m when he put out 425 c c He voided 450 c c at 3 30 p m and 500 c c at 6 20 p m Beginning at 8 p m he voided practically every half hour during the night, making a total of 6,475 c c for the twenty-four hours The output for the day previous had been 1 000 c.c Vital capacity yesterday was 2,250 c c, which was an increase of about 150 c c over the previous day This morning it is 2,700 c c, an increase of 450 c c There have been no evident toxic symptoms in fact, the patient complains of being hungry He still has moderate Cheyne-Stokes respiration The night nurse reports that he seemed to sleep more comfortably except for the frequent voidings On the whole, he seems definitely better than yesterday" From this point on, condition improved and the vital capacity increased to 3,500 c c Later, April 10 after being allowed to walk about the ward and the fluid and food intake had been increased, the vital capacity dropped to 2 800 c c Following this he developed symptoms of dyspnea and weakness and it was necessary to enforce continuous rest in bed, at the time of compiling this report

CASE 8 (Med No 11646, Chart 8) —An American housewife, aged 57, admitted Aug 15, 1919, with the diagnosis of chronic myocarditis, auricular fibrillation, hypertension, arteriosclerosis and chronic nephritis complained of dyspnea She had been in the hospital twice before during the last three

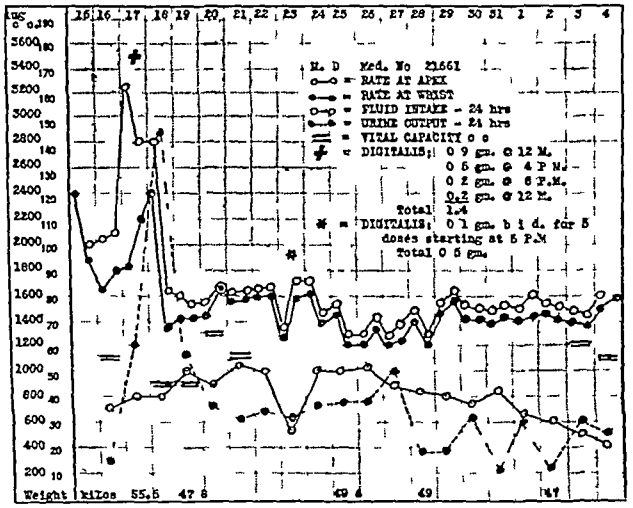

Chart 8 —Effect of digitalis in Case 8

years for symptoms of heart failure During the month previous to admission dyspnea and orthopnea had become increasingly severe The vision had been failing Retinal hemorrhages were noted a year before Examination revealed some cyanosis and distressing dyspnea The heart was enlarged, absolutely irregular and rapid, with a pulse deficit amounting on the third day to approximately 70 beats a minute The blood pressure was systolic 210, diastolic, 110 There was evidence of edema at the bases of the lungs The heart was enlarged There was no edema of the extremities The sclerotics were slightly jaundiced The patient s greatest weight in the hospital was 55 5 kg , lowest 46 2 kg On the third day the heart was very rapid with large deficit The patient was given 1 8 gm of digitalis extract in four doses at four hour intervals Sixteen hours from the last dose the heart rate was 80 with only a slight deficit The rate remained slow from this time There was a prompt and fairly marked diuresis The vital capacity was 1,100 c c on admission and was never greater than 1 300 c c during her stay of thirty-six days in the hospital The blood pressure remained high Though the patient was more comfortable after receiving digitalis and the pulse remained slow, she never showed any marked improvement She was discharged in an ambulance to continue rest at home or in a hospital for chronic cases

810 Brockman Building Los Angeles—317 Marlborough Street Boston

ABSTRACT OF DISCUSSION

DR G CANBY ROBINSON, St Louis The recent advances in the use of digitalis may be spoken of under three heads In the first place, we have learned to regulate the dosage of the drug more effectively It must be used in doses sufficient to get the therapeutic, or, perhaps, the very early toxic effects Secondly, we have learned to recognize the early toxic symptoms through the use of the electrocardiogram and the occurrence of symptoms, such as nausea Thirdly, we have learned the importance of a standardized preparation With these three conceptions in mind, we are in better position in the treatment of heart diseases than we were previously Another factor which has improved the use of digitalis is our ability to differentiate cases in which the drug is especially indicated from those in which it is not so useful We now know that digitalis is very valuable in cases of complete irregularity of the heart action, the auricles being in a state of fibrillation, while in those cases where the heart is beating regularly, digitalis does not produce such striking effects I am very glad that we have had some information from Dr West and Dr Pratt regarding the effect of digitalis on hearts that are beating normally The effect is shown by exact measurements of the vital capacity Peabody showed that the vital capacity bears a direct relation to the state of circulation and diminishes as the circulation becomes inefficient That method is valuable for the study of the circulation The aqueous extract of digitalis should be of value in that it is stable and can be standardized definitely This paper marks a definite step forward in the use of digitalis in heart disease, where we often need the drug to act rapidly, and where we need to know accurately the strength of the drug we are administering

DR C F WAHRER, Fort Madison, Iowa Given a well-diagnosed case for the use of digitalis, the next most important step is to have a reliable and dependable drug to give to the patient It would certainly be a relief to have some dependable standard Sir James McKenzie said that he had no trouble in getting a good digitalis So will you all if you insist on getting it and learn where to get it As Pratt, Eggleston and others showed there is a vast difference in the preparations on the market We should know where to go for reliable goods and not depend on the offerings of the agents of the many pharmaceutical houses

---

ETHER-OIL COLONIC ANESTHESIA*

WALTER LATHROP, M D
HAZLETON, PA

Experience with the method here described is presented from the standpoint of the operating surgeon, and has been derived from 1,002 cases of various kinds, chiefly goiter, thus distributed

Hyperthyroidism and exophthalmia	166
Cystic goiter	104
Colloid and cystic goiter	388
Parenchymatous goiter	226
Abdominal and miscellaneous	118
Total	1 002

In 1902, Cunningham, at the Boston City Hospital, devised an apparatus for introducing ether-laden air, which was used in that institution, without causing the complications of earlier methods This ether and air, however, caused colicky pains and discomfort The same conditions were found by Buxton, who observed, in addition, tenesmus, diarrhea and more or less collapse Many other reports were made by various observers, but they were largely negative, until the first marked advance was made by Sutton,[1]

* Read before the Section on Surgery General and Abdominal at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

1 Sutton in Gwathmey and Baskerville Anesthesia New York D Appleton & Co Chapter XI

using oxygen instead of air with ether He reported 140 cases in the Roosevelt Hospital, New York City, chiefly in the service of George E Brewer, but the apparatus used was rather complicated, and this method was again allowed to lapse

Hewitt [2] says, "If the risk of diarrhea, melena and after stupor could in any way be greatly reduced, rectal etherization would be strongly indicated in certain cases" This has been accomplished by the present method of combining ether and oil

Dr James T Gwathmey made the first report on experimental work, before the International Medical Congress, London, in 1913 In 1915 he published a very complete paper [3] on colonic anesthesia giving its early history, experiments of various kinds, and the different technic used by those who had tried this method of inducing anesthesia That paper still stands as a complete record and reference, worthy of being read by all who may be interested in this subject

In cooperation with Gwathmey, experiments were made by Dr Charles Baskerville, professor of chemistry in the College of the City of New York and Dr George Barclay Wallace, professor of pharmacology, University and Bellevue Hospital Medical College, to determine the rate of evaporation of ether from oils, and tests were made with vegetable, animal and mineral oils, such as olive, cotton seed, peanut and soy bean, cod liver, lanolin and liquid petrolatum The ether used was free from acids, aldehyds and water The experiments were made in glass, and, while not showing the changes that would take place when the ether and oil come in contact with the walls of the colon, on account of diffusion and osmosis, yet some facts were well demonstrated

1 While ether boils at 34 6 C it does not escape violently from an oil-ether mixture, as from an aqueous mixture when heated higher, nearly to 37 C, or body temperature

2 The rate of separation of ether from oil quickly acquires a definite and fairly fixed speed [4] This rate of separation is important, as a proper content of ether may be maintained in the blood to produce a desired effect, as, for example, the surgical stage of anesthesia Four factors acting in harmony, help to maintain an even anesthesia

1 The constant rate of evaporation of the ether from the oil

2 The distention of the colon, causing less ether to be absorbed than when partially distended

3 Cooling of the mixture and the intestine as the ether leaves the oil, which retards elimination and absorption

4 The difference between the absorptive power of the colon and the eliminative capacity of the lungs (Gwathmey)

Within five minutes after the injection of the mixture into the rectum, it is heated to body temperature, some ether leaves the oil in the form of gas, which is absorbed by the blood in the capillaries about the colon The ether is carried through the liver by the greater circulation to the heart, and from there it is pumped into the lungs, where some of it is excreted by the air passages while the remainder is reabsorbed, and carried on to the brain and central nervous system The odor of ether and paraldehyd can be detected on the breath in from three to five minutes after the administration of the preliminary dose The accumulation of mucus or saliva, seen often in inhalation anesthesia, is absent, there appears to be no irritation of the lungs, as only the ether required for narcosis passes through the respiratory tract, and the bronchial secretions which are increased by local irritation under inhalation methods, are absent

The respiration is normal, as a rule, and very seldom noisy or stertorous, if the anesthetist is watching the patient The eye reflex is usually retained, even though good muscular relaxation is present I have noticed analgesia in a number of cases, as also have others, and have conversed with the patient at different times during the operation, this is not to be expected very often The pulse is maintained at an even plane, if rapid, as in hyperthyroidism, it usually remains so, though we frequently get a slowing which is no doubt psychic In ordinary cases the pulse remains full and strong The blood pressure varies In cases of great nervous tension, such as exophthalmia, observation has shown that the pressure falls after the patient is asleep, and usually rises immediately on his regaining consciousness The diastolic pressure is usually low Pressure in ordinary cases does not vary much though the amount of surgical interference naturally has a decided effect This applies to hemorrhage, and undue manipulation of viscera

The safety of this method is shown by several factors, such as the rate of evaporation of ether from oil in accordance with well known physical laws The ether may be separated from the oil at any time by warming, but unless deliberately raised to a high point, it passes off slowly, especially at body temperature After administering the mixture it is impossible to withdraw oil and leave ether, or vice versa Each molecule of one is bound to a molecule of the other, and the union is broken only by evaporation It is impossible to have deep anesthesia at one minute, and light anesthesia at another, unless purposely accomplished by rebreathing, or made light by an air-way tube or a face free from covering

Sutton has shown that when the colon is fully distended, less ether is absorbed When we recall that the absorbing surface of the colon is much less than that of the lungs, we see that some distention of the colon is necessary to increase its absorbing surface, and we know that overpressure does not take place for there is very seldom distress after anesthesia such as diarrhea, bloody stools or tenesmus, that was usual with the Cunningham-Sutton method Again, when the ether leaves the oil as gas, the intestine is cooled during the process This retards elimination and absorption thus regulating the dose The temperature of the patient remains constant and the cold, clammy skin so often seen under inhalation anesthesia is absent in nearly all cases The gradual absorption of the ether by the colon no doubt acts as an element of safety Wallace made a study for one hour by sphygmographic tracing, of a number of animals under ether-oil anesthesia, during which the pulse and respiratory tracings never varied This fact has been well demonstrated in many hundreds of patients surgically anesthetized by this method in whom without any supplementary anesthetic, the pulse, respiration,

3 Gwathmey, J T American Year Book of Anesthesia and Analgesia 1915
4 Baskerville Am J Surg January 1916

reflexes and blood pressure all remained constant, except, as already mentioned, in hyperthyroidism

The value of olive oil has been shown by Graham, who proved beyond question that this oil is capable of restoring to the blood certain properties which are inhibited by the action of the ether, that is, those concerned with phagocytosis The injection of certain amounts of the oil into the rectum is followed, after three to six hours, by a restoration of phagocytic power, although ordinary depression lasts for some time The oil absorbs any ether vapor that may still remain in the intestine, and not only prevents protracted undesired effects, but also insures speedier restoration of the opsonic index, and satisfactory recovery

It is interesting to note that the experiments of Dr W H Park of New York showed that an ether in oil mixture killed the colon bacillus in one minute, thus giving another factor of safety in the possible prevention of infection Our experience has shown that the postoperative effects are better than with the routine inhalation methods of ether and chloroform, though there is no doubt about the great value of nitrous oxid and oxygen anesthesia

After ether-oil anesthesia there is less vomiting or nausea, and the patient is usually comfortable and can retain nourishment, and of greater importance is the fact that there is considerable analgesia for some time, often for two or three hours, which adds to the ease of the patient

Anociation as practiced by Crile can be carried out easily, and no doubt is very valuable in many conditions, especially exophthalmia and hyperthyroidism Ether-oil anesthesia is especially useful in head and neck operations, because the operator is not troubled by either cone or anesthetist It is also useful in hernias, especially as seen in patients with asthma, and in our work among coal workers, who have the common condition known as miners' asthma These patients sleep calmly throughout, with none of the choking and cyanosis seen under ether by inhalation The value of local anesthesia must not be forgotten in these conditions also

Patients with short thick necks are especially good subjects for colonic anesthesia The most valuable of all its uses is in those conditions of high nervous tension, such as hyperthyroidism, or in cases just on the border line of toxic goiter, and also when fear is a prominent factor, as seen in nervous women, and in men as well To be able to etherize a patient in bed, remove her to the operating room, perform the operation and return her to bed with little or no knowledge of what has been done, is surely worthy of consideration, and trial in proper cases

TECHNIC OF ADMINISTRATION

It is most important that the use of the mixture be in the hands of one who can begin its administration and have it under his care throughout and in all cases It should never be delegated to a different physician or nurse each time it is used The same care should be taken as in any other type of anesthesia Experience is the great factor, and in our earlier work we used much more anesthetic than at present After trying out various combinations and proportions, we settled down to the routine method to be described The patient should be under observation for twenty-four hours or more This does not apply to exophthalmic or hyperthyroid conditions, in which preliminary observation and treatment are imperative The evening before operation an enema of soapsuds (2 pints) is given A second enema of 1 or 2 pints of clear, tepid water is given early the next morning To illustrate Supposing the operation is set for 11 a m , then at 9 30, 2 drams of olive oil (warm), 3 drams of paraldehyd and 4 drams of ether, are given The patient should be kept as quiet as possible At 9 50, $\frac{1}{4}$ grain of morphin and $\frac{1}{150}$ grain of atropin are given hypodermically At 10 20, 3 or 4 ounces of ether and 2 ounces of olive oil (warm) are given The oil and the ether are put in a bottle and shaken thoroughly The patient should be on the left side with both knees flexed, the right acutely A rectal or colon tube with a funnel should be inserted not more than 6 inches, care being taken to have the mixture in the tube and all air expelled, before inserting The mouth and nose should be covered with several thicknesses of gauze The injection should be given slowly, *about one ounce a minute,* the funnel being held about 3 inches above the level of the patient The tube should be clamped and allowed to remain in the rectum so that the mixture may be withdrawn during operation if there should be any indication for doing so If there is any excitement, 15 or 20 drops of chloroform usually quiets the patient If the patient cannot retain the oil-ether mixture, one should not try to repeat, but abandon it The patient should be ready for operation in from twenty to thirty minutes from the time the last injection is given The reversed Trendelenburg position seems to aid in the maintaining of an even plane of anesthesia The jaw should be supported so that respiration will be unobstructed

In alcoholic subjects, $\frac{1}{100}$ grain of scopolamin (hyoscin) is added to the preliminary hypodermic injection of morphin When the operation is completed, the bowel should be well irrigated with tepid water until it returns clear The colon may be gently massaged from right to left to aid this One pint of water is then put in the bowel and left, or olive oil may be given in quantity of 4 ounces to prevent any possible irritation that may be feared, though in more than a thousand cases we have had only two instances of irritation, both being an annoying looseness, which speedily yielded to treatment

Hyperthyroidism or exophthalmia offers a most striking condition in which the value of this method is shown These patients, as is well known are usually high strung, nervous and apprehensive, while the danger itself is by no means small We have repeatedly operated, with little or no knowledge on the part of the patient, stealing the gland has indeed been easy The procedure with these patients is as follows Supposing operation is decided on for Saturday, then a week previous, we give each day an injection of 2 ounces of tap water, with a dram of ether in it This, the patient is told, is for its tonic effect The morning of operation she is given the regular dose of ether-oil and paraldehyd followed by hypodermic, and the full mixture, all given while she is in bed She usually goes to sleep very quietly, though at times requiring a few drops of chloroform, is taken to the operation room, the gland removed, or ligation performed, and when she awakens, she is in her bed with little knowledge of what has taken place, aside from knowing something has been done to her throat, but the fear is greatly lessened or gone

COMMENT

Surely this is well worth trying in such conditions, and when supplemented by Crile's nerve blocking, is an ideal means to get results in a very bad class of cases

Mr Wade[5] of London, anesthetist to the Queen's Hospital, says "There is no doubt that this is a very valuable method of anesthesia for many operations in plastic surgery"

Ether-oil colonic anesthesia is *contraindicated* in *conditions of rectal disease,* or when *pain is caused* by its introduction It is not recommended for routine use, as the time required for successful administration would not permit of this method especially when a number of operations were scheduled For regular clinic work we depend on ether by inhalation, reserving colonic anesthesia for the class of patients already mentioned When successfully used, it will not be given up by the surgeon who tries it Dr Arrowsmith of Brooklyn has shown the value of this method in bronchoscopy and in gastroscopy, in which the absence of excess mucus in the air passages is a most valuable factor, as is also the fact that there is a clear passage for the escape of ether vapor The value is undoubted in cases in which absorption must be minimized on account of some lung, heart or kidney lesion

Our experience with this method for children has been very small, and has not been satisfactory, owing chiefly to the lack of cooperation on the part of the child, and the expelling of the mixture

To sum up, we would advocate ether-oil colonic anesthesia in the type of cases mentioned, and emphasize the safety, comfort, control, efficieny and simplicity of the method Under efficiency, we can do no better than quote Gwathmey, whose conclusions are practically in accord with our own

The method insures prevention of shock narcosis is smooth and of uniform depth pulse and respiration remain near normal A complete relaxation of the muscular system is secured The stage of excitement is eliminated The patient inhales a warm moist vapor and the direct irritation of a concentrated vapor is overcome There is no eructation of gas, before or after, in 95 per cent of cases Hypersecretion of mucus and saliva is absent The patient s stomach, lungs and kidneys are spared The absence of the ether cone in surgery of the head and neck lessens the technical difficulties of the operation by giving continuous access to the field of operation

Postoperative nausea and gas pains are reduced to a minimum

State Hospital

ABSTRACT OF DISCUSSION

DR. JAMES T GWATHMEY, New York Certain fundamental principles should be emphasized When physiologically understood, ether-oil colonic anesthesia is one of the easiest methods to administer, requiring only a rectal tube with funnel attached and quiet for the patient It is one of the safest methods The margin between full surgical anesthesia and a toxic dose is greater than with any inhalation method It is one of the most pleasant methods for the patient, as attested by the fact that those who have tried other methods prefer the colonic A greater relaxation of the musculature exists than is usual with any inhalation anesthetic A smaller amount of ether per hour is required than by any other method The estimated amount is two ounces per hour which seldom varies It is regulated as easily as any inhalation method, by (*a*) covering the face with a towel to deepen the anesthesia (*b*) by placing an airway tube to lighten or (*c*) by unclamping the rectal tube and draining the residue and flushing thoroughly It can be terminated at any time, as far as the anesthetic is concerned, the patient continuing to sleep from the other drugs used While the rate of absorption is slightly different with each patient, dependent on the age temperature and general condition it is constant when established—an anesthesia deep at one time and light at another is physiologically impossible The brain is more completely protected against reflex stimuli than by any method of inhalation anesthesia, and this is proved by the patient crossing his legs, changing his position or conversing with the surgeon as in spinal analgesia So called analgesia with nitrous oxid-oxygen, where the patient is continually squirming and refusing to be comforted by the anesthetist but on awakening remembers nothing of the pain is not analgesia but amnesia The brain is not protected in so-called analgesia with nitrous oxid and oxygen The complete analgesia of the colonic method is dependent on the synergistic action of all the drugs concurrently given with the ether—an extra amount of ether will not have the same effect The quiet sleep and analgesic stage for a few hours after the anesthetic is terminated is an advantage to the patient, and should not be counted against the method

DR. ALEXANDER PRIMROSE, Toronto In the hospital at Sidcup, England Major Gillies found that rectal anesthesia by ether oil was entirely satisfactory In these cases requiring a prolonged technic for the repair of face and jaw wounds it was important to get the anesthetist out of the way of the operator

DR J SHELTON HORSLEY Richmond, Va When a cautery must be used in the mouth colonic anesthesia is ideal It would seem indicated in cases of exophthalmic goiter but here, in my hands the results have been unsatisfactory, probably because this disease causes some affection of the liver, as Dr Crile has shown If you pour all the ether through the portal circulation and concentrate it on the crippled liver there may be unfortunate results It is like giving ether by inhalation to a patient with seriously damaged lungs

DR GEORGE W CRILE, Cleveland Do you use local anesthesia in conjunction with local analgesia?

DR WALTER LATHROP Hazleton Pa Yes Our best success has been with the exophthalmic type of goiter We have had very few mortalities not more than we would have had with any other method because we know what hyperthyroidism means We get these patients in the best condition possible If we are going to operate a week from today on a woman highly strung nervous scared to death she is given a dram of ether and two ounces of tap water as a "tonic" This is repeated daily until the seventh day when she is given the regular dose of paraldehyd ether and oil followed by a hypodermic She wakes up in bed after the operation with little knowledge of what has been done

5 Wade Anesthetic Supplement Am J Surg July 1919

Early Diagnosis of Breast Cancer—It is wrong to teach students that axillary lymphatic enlargement is a sign of breast cancer and it is criminal to ask men to wait for its appearance before making a diagnosis Which of us would await the onset of gangrene before diagnosing strangulation in a hernia? Yet the enlarged lymph nodes of the cancerous breast are almost as fatal a complication in the long run as gangrene is in hernial strangulation Bloodgood s aphorism expresses this graphically when he tells us that a woman with a cancerous lump in her breast, but no cancerous glands in her axilla has four chances out of a possible five of a permanent cure by operation whereas a woman with a cancerous lump in her breast and cancerous glands in her axilla has not one chance in five! You will see then that to wait for the appearance of an enlargement of the axillary glands to make a diagnosis of cancer of the breast is to throw away 600 per cent of your pa ient s chances of an operative cure An earlier diagnosis is our only hope of obtaining better results—W Doolin *Med Press,* April 28, 1920

RELATION OF QUANTITATIVE METHODS TO THE ADVANCE OF MEDICAL SCIENCE*

EUGENE S KILGORE, M D
Assistant Clinical Professor of Medicine University of California Medical School
SAN FRANCISCO

The progress of science has been marked by the transition from purely qualitative observations to quantitative determinations In astronomy the possibility of measurements was perceived very early and carried out with comparatively a high degree of accuracy In physics and chemistry the phase of measurements came mainly with the modern development of precision instruments, and it has been largely through their use that these sciences have come up from the notions of alchemy and of fire and water as elements Measurements in the biologic sciences are still more recent, but are now being pursued with increasing attention They occupy a prominent place in a large part of recent biologic literature, and their importance has been so far emphasized as to give the name *Biometrica* to a leading research journal in this field

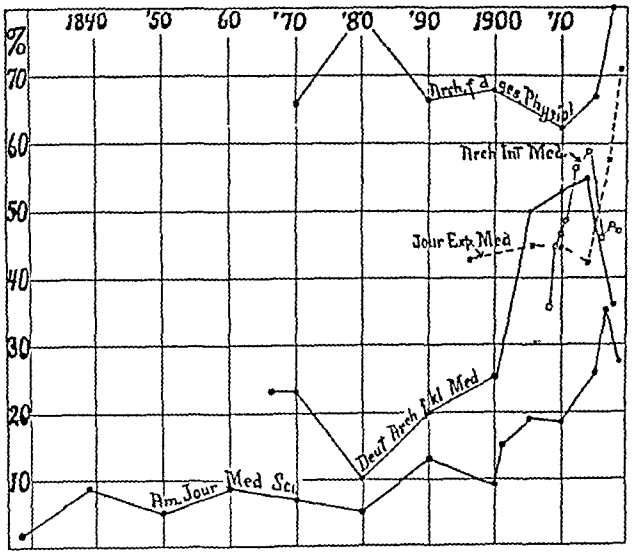

Chart 1.—Percentages of quantitative reports in various medical journals

That the medical sciences are following the same trend has frequently been noted I have examined the extent to which this is true by sorting, in several representative journals, the original contributions in two classes, which may be called quantitative and nonquantitative contributions Among the former were included only reports of investigations in which the idea of quantity was a main if not the sole objective of the investigators—mere statements of such quantities as weight, temperature or blood pressure were not used to classify an article as quantitative if they were but incidental to the main purpose of the description Statistical analyses of clinical or other material were counted as quantitative In going over the literature from this point of view, one is struck by the comparative vastness of opportunity for important research in the domain of measurements As the discovery of Columbus was delimited in succeeding years by thousands of surveyors, so the discoveries of Harvey, of Pasteur and of Bright have prompted myriads of researches on circulation dynamics, on virulence and immunity, and on kidney function

The results of the survey are shown graphically in Chart 1 It will be seen that of the contributions to the *Archiv fur die gesamte Physiologie* about three quarters have always been quantitative reports In the field of more strictly medical research occupied by the *Journal of Experimental Medicine,* the quantitative reports have been about 50 per cent of the whole number, and apparently are on the increase The same approximately is true for the *Archives of Internal Medicine* These represent the comparatively recent type of medical journal for original reports The *Deutsches Archiv fur klinische Medicin* and the *American Journal of the Medical Sciences* represent the older type of clinical journal, and they illustrate well the shift in emphasis toward quantitative endeavor which characterizes the more recent work The effect of the war is not yet clear, but there is a suggestion in both these curves of an interruption in their ascent or a positive decline

Among the quantitative reports encountered in these journals, a considerable number were so classified because they made use of statistical methods in analyzing qualitative data In many other cases the original data consisted of measurements of one sort or another to which statistical methods were applied in assembling and making deductions It is therefore apparent that statistical methods of research, while primarily designed for problems in economics, in recent years have found increasing application in medicine In other biologic sciences in which they have been employed more seriously they have become recognized as particularly applicable to the study of "characters" which vary on account of a large number of causes that are difficult or impossible to separate Medical problems are very largely of this class and, accordingly, it is no surprise to find medical literature, and especially clinical literature, abounding with statistical reports It is a remarkable fact, however, that almost without exception, even in the hands of workers in our foremost research and teaching institutions, medical statistical studies have confined themselves to the consideration of simple averages or associations, with little or no attention to the degree of probability supporting the "conclusions" drawn—without, in fact making any serious application of the theory of probabilities with which they are so intimately concerned Under these circumstances, it is of course natural that statistical methods themselves should be blamed for many abuses

It being possible in this paper to call attention to only a few of these methods, I shall do so by illustrations, and without presenting mathematical proofs[1]

1 *Inconsistency of Statistical Data*—If it were reported that among 100 cases of hypertension there were (A) fifty-two over 50 years of age, (B) thirty-one with albuminuria, and (C) forty-seven with decreased phenolsulphonephthalein elimination, and that of those over 50, fourteen had albuminuria (A B), and four decreased phenolsulphonephthalein excretion (A C), that albuminuria and decreased phenolsul-

* From the Department of Medicine University of California Medical School
* Read before the Section on Practice of Medicine at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

1 For an elementary exposition of the theory of probabilities the reader is referred to Yule, G U An Introduction to the Theory of Statistics Griffin & Co 1912 for a guide to the use of formulas Davenport C B Statistical Methods New York John Wiley & Sons 1914

phonephthalein (B C) were associated nine times, and in the group over 50 years (A B C) twice, there would be nothing obviously wrong with the figures And yet, by simple arithmetic,[2] it can be shown that they are impossible

2 *Association of Attributes* — Attributes may be associated positively (e g, cases with positive Wassermann reactions and aneurysm), negatively (e g, presence of adenoids and excellence of intelligence of schoolchildren), or they may be independent (e g, blue eyes and gastric ulcer)

The Criterion of Independence If two attributes, such as astigmatism (attribute A) and adenoids (attribute B) are independent, then the proportion of A's multiplied by the proportion of B's will tend to equal the proportion of A B's (individuals having both conditions) Thus, if among 1,024 schoolchildren, 384 had astigmatism and 144 adenoids, we should expect, if these are independent, that about $\frac{384 \times 144}{1\,024} = 54$ would show both abnormalities

A "coefficient of association" may readily be calculated to express numerically the degree of positivity or negativity in an association, from +1 (complete positive association) to 0 (independence) or −1 (complete negative association) But the value of deductions as to associations of attributes expressed by such a coefficient or otherwise will naturally depend on the numbers of observations made, and accordingly the amount of variation to be expected from chance alone This expectancy may also be shown quantitatively, as will be shown in the discussion of variables

3 *Manifold Classification* —This may be illustrated by the accompanying table showing the number of times certain gastric acidity findings are supposed to have occurred in association with the diagnosis given

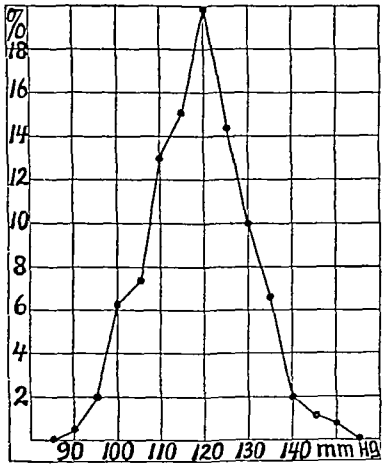

Chart 2 —Example of a frequency polygon showing the distribution of systolic blood pressure measurements in a group of 314 young men

Not only may the relative frequencies of diagnoses in relation to acidity findings and vice versa be seen from such a table, but, by calculating a contingency coefficient, it may be shown whether or not on the whole these conditions are related to the acidity findings, and if so whether the relation is very close or the reverse, that is, the general value of acid measurements could be stated mathematically and this might be compared with the general value of other diagnostic procedures

4 *Frequency Distribution* —As distinguished from the simple attributes of the foregoing examples, the following case of a frequency distribution illustrates some of the special methods applicable to variables If the blood pressure of a group of young men is measured, the results may be expressed in a table showing the number of measurements in the "class intervals" 100 to 104 mm of mercury, 105 to 109, etc, and the same may be shown graphically in a "frequency polygon" such as Chart 2 If the observations are numerous enough and the class intervals small enough, such a polygon may closely approximate the ideal "frequency curve" for the series In medical literature there usually accompanies such studies a statement of the arithmetical mean or common average, and often of the "range" or the highest and lowest in the series, but very rarely indeed is serious attention paid to other characteristics of the frequency distribution, such as the "median" (or mid-value), the "mode" (or most frequent value, i e, the "peak" of the curve), the question of "complexity" of the curve, or the amount of "dispersion" present The last item is particularly important and is not covered adequately by a statement of the range, which depends on the chance variation of extreme values of the variable A good measure of dispersion must take into account the scattering of values among all the members of the series Of several that do this, the "standard deviation" is most commonly used by statisticians [3]

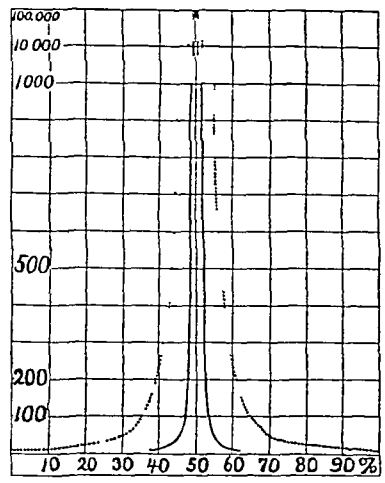

Chart 3 —Precision of percentage lymphocyte count

5 *Simple Sampling of Attributes* —This finds an example in the ordinary differential count of leukocytes Our interest here, from the statistical point of view, is in the "precision" or accuracy of the observed proportions of the different types of cells It can be shown that this varies as the square root of the number of observations on which the proportion is based, that is, the percentages based on a count of 400 cells are not four times but only twice as dependable as those obtained by counting 100 cells

GASTRIC ACIDITY AND DIAGNOSES

	Hyperacidity	Acid Normal	Hypo Acidity	Totals
Gastric cancer	20	56	200	276
Peptic ulcer	310	90	4	404
Gallbladder disease etc	200	165	65	430
Totals	530	311	269	1 110

Again, if in a given case the percentage of lymphocytes in one count of 100 cells was found to be 47 per cent and later in a similar count 53 per cent, it may be important to inquire whether or not the difference of 6 per cent is due to an actual change in the composition of the patient's blood—in other words, whether or not the difference is readily chargeable to "fluctuation of simple sampling" or whether probably "significant" Most clinicians would regard this difference as probably indicating a change

2 Thus 100 — 52 — 31 — 47 + 14 + 4 + 9 — 2 = — 5 (Yule)

3 The standard deviation is the square root of the average of the squares of the deviations of the series from the mean squaring

To examine this point, let us suppose that in this case the actual percentage of lymphocytes as determined by a count of millions of cells examined on the same day was 50 per cent It is evident that if this large number were counted by groups of 100 cells each, the percentages obtained from these separate groups would for the most part differ more or less from the general average of 50 per cent They could then be treated as a series of variables and their range and standard deviations could be determined as indicated above Or, without using such an experimental method, the standard deviation (in this case 5 per cent) could be obtained directly from a formula [4]

Now it can be shown experimentally as well as mathematically that a series of variables such as this will be scattered over a "range" approximately three times the standard deviation both above and below the general average In our example, some of the lymphocyte counts will be as low as $50-(3\times5)=35$ per cent , and some as high as $50+(3\times5)=65$ per cent , also, within the limits of the "probable error" (about two-thirds the standard deviation, hence in this case from 47 to 53 per cent) the chances are even that in our illustration a given count of 100 cells will yield a lymphocyte percentage within or without these limits It is therefore apparent that the observed difference of 6 per cent between the counts mentioned is quite without significance

Chart 3 shows, in relation to the number of cells counted, the precision of the percentage lymphocyte count in the case we have considered The solid line shows the "probable error," i e , the limits within which there is an even chance for an individual count to fall The dotted line shows the range, i e , the limit which will include about 99 per cent of the observations Occasionally results will even fall outside these limits through the operation of chance alone

The lesson of these examples of the blood pressure study and the lymphocyte count, it will be seen, have a general application to studies involving averages, percentages and other variables The average metabolic rate, or weight, agglutination titer, or blood nitrogen in one group of individuals as contrasted with another, the mortality, or the percentage of cures following different methods of treatment may and frequently do present differences which writers refer to as 'very striking" or "highly suggestive," and which simple calculations show to mean nothing whatsoever The illustration we have used has been dwelt on because it brings out the one pitfall of statistics commonly overlooked by medical workers—that associated with failure to make sufficient allowance for the operation of chance in sampling In forming inferences from averages, great care is needed to exclude other causes of differences than the one to be investigated, but this necessity is more obvious than the necessity of considering in connection with each average its probable error or other measure of precision

Although the mathematical training necessary to use such simple aids and safeguards in statistical work is comparatively little, it is too much to expect any sweeping change in the practices of the present generation of writers But for the future the defect can be remedied by readjustment of the premedical curriculum The change would not require more time in the premedical course, and would not necessarily curtail the usual instruction in physics, chemistry, biology and language, although it would undoubtedly be justified at this price Two or three hours a week for one semester would provide a good elementary knowledge of the theory of probabilities, and most medical students have spent enough time in mathematics to have included in it this subject without detriment to their general mathematical training For the purposes of general culture and mental discipline it would equal higher algebra, conic sections or trigonometry, which many of them study, and for their practical purposes it would far surpass these subjects Although calculus is useful, the elementary course in theory of probabilities would not necessarily require as prerequisite anything more than high school algebra In most universities the cooperation of the mathematics department would be necessary to rearrange the courses open to medical students, in fact, in many departments of mathematics it would be necessary to organize the course in theory of probabilities, as this subject at present is commonly left to the department of economics

4 $\sigma=\sqrt{npq}$ where n = the number of cells counted in each sample p the chances for an individual cell encountered to be a lymphocyte and q the chances for it to be other than a lymphocyte

SUMMARY

A survey of medical literature shows that medicine, following the trend of other sciences, is seeking its advance increasingly through the use of quantitative methods of research The multiplicity of variables inherent in the laboratory, as well as the purely clinical material, requires the constant use of statistical methods of analysis and interpretation Medical writers generally have relied purely on intuition in these interpretations—a practice that leads very frequently to gross misstatements of results, and which has thereby brought unmerited discredit to the use of statistical methods in medicine The elementary theory of probabilities which deals scientifically with these methods is comparatively a simple branch of mathematics, is of great practical significance, and should be required in the premedical curriculum

ABSTRACT OF DISCUSSION

DR HENRY A CHRISTIAN, Boston There is no question that there is a false security felt in figures With insufficient knowledge, we attempt to utilize figures as a basis for drawing conclusions, and we make many mistakes in doing that Dr Kilgore pointed out some of the sources of these errors Among others are the quite common error made by medical men in drawing conclusions in statistical form, from a very small group of cases, or to figure out the percentage of the occurrence of some symptoms, or some preceding disease in the history of the patient, or some finding in the patient, and conclude that it has a causal relation on account of its frequency of occurrence Perhaps, because we find that 30 per cent of our patients have bad teeth, we conclude that the bad teeth are the cause or one of the causes of that condition We do not stop to secure the figures relative to the occurrence of just those same things in persons who are otherwise well, or who have entirely different diseases If we are going to play with figures we should know the rules and laws of the statistician On the other hand, it is well to remember that the statisticians, knowing the laws of the game as far as statistics are concerned, fall into error, because often they draw their conclusions in a very accurate way from the statistics, but the data from which they make the statistics contain many inaccuracies For example, you will find statistical literature showing the relative frequency of death with pneumonia, and death without pneumonia, in cases of influenza That is not of very much use because in most of the cases, the death report is made by a man who did not know whether the patient died with or without pneumonia He was too busy examining the

lungs, or he did not realize how few signs many patients with influenza had, when the necropsy showed a very extensive pneumonia

DR E S KILGORE, San Francisco Dr Christian's point against the professional statisticians who attack medical problems is well taken Medical problems obviously require medical training for their intelligent study But it is also true that statistical problems require a knowledge of statistical methods for their intelligent handling In some cases both requirements have been met by the collaboration of the medical man with the statistician But the point I wish to emphasize is that the applications of the theory of probabilities in medicine are very numerous, so numerous that, at least, a rudimentary knowledge of the subject is essential for medical investigators, and even for those who would read intelligently and critically the medical literature

MISLEADING SYMPTOMS AND ROENTGEN-RAY FINDINGS IN SUSPECTED MASTOID ABSCESS *

RICHMOND McKINNEY, M D
Professor of Otolaryngology University of Tennessee College of Medicine
MEMPHIS, TENN

There is no especial literature pertaining to the subject that I am to present, for it is purely a clinical one, and such deductions as may be reached are wholly derived from clinical experience

When to operate in suspected mastoid abscess is largely an individual question, to be determined by the symptoms shown in each case, but we have all learned that there are certain cardinal principles which govern us in our consideration of the indications in the individual case However, experience teaches us that these cardinal principles must be duly and carefully weighed in each instance, for in many cases the exception proves the rule in suspected mastoid abscess, and our operative findings not infrequently are in dissonance with the subjective and objective symptoms

A septic temperature course, painful mastoid to pressure, a leukocytosis and a history of purulent middle-ear discharge of a week or ten days' duration would be regarded as a syndrome clearly indicating a suppurative mastoiditis, demanding operation Bearing on this are the history and operative findings in Case 1

CASE 1.—Sylvia B, colored aged 37, ten days before coming to the hospital developed sore throat, with chilly sensations, and shortly afterward her nose began bleeding and both ears pained a great deal, followed by a serosanguinolent discharge from her ears A swelling, painful on pressure, developed back of each ear

Examination of the ears made at the hospital revealed both canals full of pus There was marked swelling and tenderness over both antrums and mastoid tips The temperature was 104 4 in the afternoon The blood count was 11 200 leukocytes and 78 per cent polymorphonuclears

The history and symptoms pointed conclusively to double mastoid abscess, so the following morning, the temperature at the time being 102, the right mastoid was first explored, not a drop of pus or even a soft cell being found, clear to the antrum, which also was free of pus The left mastoid was then opened, with the same result as the right The temperature went to 104 in the afternoon of that day and then progressively declined the patient being discharged in normal condition nine days after the operation

What prettier picture of mastoid abscess could be asked? It was so positive clinically that we did not even wait for roentgen-ray pictures of the mastoids, and with these symptoms, negative roentgen-ray findings would not altogether have convinced us that there was not pus in the mastoid cells Both mastoids were congested, and perhaps would have broken down in a short while, so the operation may have been conservative in this sense But the fact remains that with freely draining middle-ears, this case was running a high, septic temperature course, and presented what usually are regarded as positive mastoid symptoms

The question that would here arise is, Would I have been justified, in the presence of these typical symptoms, in delaying operative interference? There can be no fixed rule as to when to operate in such cases, for we all know from actual experience how rapidly some develop, and how quickly a meningitis or sinusitis can set up when the pus absorption is so great In the case just related, both subjective and objective symptoms not only justified, but to me, demanded operation

We are all familiar with the type of abscess found in young children, when pus has broken through the antral wall externally producing a fluctuating mass back of the ear So Case 2 may have been regarded, if we had not carried our operative investigation deeper than customary

CASE 2.—Sterling M white, aged 12, was brought to the hospital with a history of earache in the right ear, beginning three weeks before Something like a 'boil' according to the father, developed behind the right ear, with a great deal of pain and increasing swelling The child's father stated that the boy had experienced similar attacks previously, and some time before the same ear had swelled and burst externally, back of the ear

Examination revealed a fluctuating mass, about the size of a small hen's egg over the right mastoid process The membrana tympani was congested but there was no pus in the canal The temperature was 100, in the afternoon, the blood count leukocytes 11 200, polymorphonuclears, 80 per cent Roentgenoscopy revealed the mastoid normal

Under ether the mass was opened with the usual mastoid incision After removal of a large quantity of pus the entire mastoid process was bared of periosteum, and carefully investigated for a sinus None being found, the antrum was uncovered but no pus encountered The boy left the hospital in a few days, entirely recovered

There was in this case evidently a burrowing of pus from the middle ear beneath the periosteum of the external auditory canal, without involvement of the bone, but it is remarkable that the corresponding membrana tympani was not ruptured Perhaps this was one of the type of cases that we sometimes see reported as "mastoiditis without middle-ear inflammation"

Along somewhat similar lines is Case 3

CASE 3.—Charlie J white aged 34 came to the hospital with a history of pain beginning in the right ear five weeks previously There had been a slight discharge from the ear, but none recently Four weeks before he began having pain back of this ear with swelling and for this reason, the pain continuing, he came to the hospital

Considerable swelling was found over the right mastoid, and it was intensely painful on pressure There was no discharge from this ear The temperature was not running high but would make quick drops to below normal The blood showed 11 200 leukocytes and 84 per cent. polymorphonuclears Roentgen-ray examination revealed a normal mastoid

The usual mastoid incision was made and a large amount of thick pus removed The bone apparently was healthy, but

* Read before the Section on Laryngology Otology and Rhinology at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

the antrum was entered, without pus being found Convalescence was uninterrupted, with the exception of several marked exacerbations of temperature, with sudden drops to subnormal, coming on the third, sixth, seventh and eighth days after operation, due probably to some retention, as there were no symptoms of intracranial complication, and from the tenth day following operation there was no further fever

Here was another case of middle-ear abscess which had burrowed beneath the periosteum, without bone involvement, and could, to the operator's exaltation, be called a "blind" mastoid abscess, but the surgeon would have to be indeed "blind," in more respects than one, so to denominate this condition

In this connection I should like to say that I am very skeptical of numerous reported cases of mastoiditis without previous middle-ear suppuration I doubt whether this ever occurs, though in this conclusion I may be quite wrong Still, it is somewhat difficult to conceive of a suppuration in the mastoid cells without a previously existing suppurative condition at the gateway to these cells—the middle ear

In reviewing my entire experience in mastoid surgery, I cannot recall an instance of suppurative mastoiditis in which either from the history or clinical evidence, a previously existing middle-ear inflammation was not traceable To me it is a good deal like reported cases of primary laryngeal tuberculosis—I have heard of such cases, but have never seen one, this condition in my experience always being secondary

A case of more than ordinary interest is this

CASE 4—C S O, man white aged 22 consulted me July 28 last year with this history He had been subject to "risings" in the left ear all his life He had four attacks of this kind while in the army in France Six days before an intensely painful abscess developed in this ear Since then the ear had been discharging thick yellowish pus He had been having high fever and the entire left side of his head had been quite painful In fact, his suffering was so intense that he was being kept constantly under the influence of morphin He had lost 16 pounds since the beginning of this attack

On examination, the external auditory canal was found full of thick, yellowish pus with drooping of the posterosuperior canal lining There was intense pain on pressure over the mastoid antrum and tip The patient's temperature was 100 4 at 3 p m A roentgenogram revealed a cloudy mastoid apparently beginning to break down Operation was refused, but the symptoms continuing on the afternoon of the 31st, mastoidectomy was performed Much to our surprise while the mastoid was hemorrhagic not a drop of pus was encountered none being found even in the antrum However, recovery was prompt following the operation

Here everything was positive, including the roentgen-ray findings, yet operation showed how erroneous was this all But doubtless this was another borderline case, and would have gone to suppuration later The operation was conservative, in that it brought relief

There is no question in my mind of the value of roentgenograms in suspected mastoid abscess In most instances, well-taken roentgenograms give positive evidence that is invaluable in aiding the surgeon in determining whether or not operation is necessary, although these pictures sometimes may prove misleading, as in the case just cited But no otologist should neglect to have such pictures made whenever possible, not only for their diagnostic worth, but also as operative guides However, the absence of positive roentgen-ray findings should not lull us into a sense of security which may be false, and cause us to fail to give the patient the benefit of opportune surgery Clinical symptoms must in the final analysis be our most dependable guide, even though at times we err to the extent of performing what may appear to have been an unnecessary operation

Here let me briefly relate the details of a case which is almost amusing from a diagnostic standpoint, but had its very serious aspect to the patient

CASE 5—Mrs B, aged 30 consulted me, Oct 10, 1919, with reference to the condition of one of her ears, which six days before developed an abscess which burst and discharged for three days She had been suffering a great deal with this ear even after it began discharging She was much alarmed, because some six weeks before having then an abscess in each ear, she had consulted a specialist in a nearby town and after making roentgenograms of both mastoids, he told her that she had an abscess in each mastoid, was in imminent danger of her life and must urgently have both mastoids opened and drained

There was no pus in either ear when I saw this patient, and no mastoid symptoms I had pictures made of the mastoids, and they showed absolutely normal mastoids

To return to the symptomatology, the first of these cases which I have outlined presented a typical and classical syndrome of suppurative mastoiditis It is true that in this case the roentgen-ray findings were negative as to mastoid abscess, but in the presence of such positive clinical symptoms, it would be an extremely conservative attitude that would consent to refraining from operation

In the next two cases, while there did not exist at the time seen an aural discharge, both gave positive evidence of mastoid suppuration, with probable necrosis through the outer table, and the operative revelation of entire absence of mastoid involvement was most astonishing

The fourth case lacked nothing by way of positive evidence, but utterly failed on operation to bear out these findings, or to account for the exaggerated symptoms of an acute suppurative mastoiditis

While none of these cases proved to be what was operated for, that is, a suppurative mastoiditis, still, recovery apparently was hastened by operation, and even with this experience before me, I expect in future to have similar cases which will be handled in the same manner, owing to the fact that even a careful study of such cases, before advising operation, is not always going to eliminate for me the possibility of just such operative findings as I have outlined in the cases described

When we consider the classic textbook indications for operation in mastoid abscess, we can find enough of these in any of the cases reported by me to justify operation, and yet in the light of the experience of any of us, I doubt whether there are not instances in which the classic indications are not borne out by operative findings I am aware of the fact that some claim that, in conjunction with other symptoms, the drooping of the posterosuperior lining of the external auditory canal is always an indication for opening the mastoid, but I am not inclined to stress this symptom too much Case 4 presented this markedly, and I have failed to find this drooping in some cases in which there was extensive suppuration in the mastoid cells, as was operatively demonstrated So it is with other symptoms which are regarded as very positive indications, and which may prove just as misleading These, however, are the exceptions to the rule, and in the final analysis, I think that, after duly weighing all considerations in a given case, it is far safer and better for the patient that the surgeon should abide by the

cardinal principles laid down as indications for operation in these cases, and that it is far better occasionally to open an innocent mastoid than to delay in the presence of the danger, always present, of intracranial complications, which so rapidly may supervene, and result in a fatality that could have been avoided by a mastoid exenteration

Bank of Commerce Building

ABSTRACT OF DISCUSSION

DR FRANCIS P EMERSON, Boston The roentgen ray is as an adjunct in diagnosis, confirmatory of the clinical picture We have often checked up our operative findings with the roentgen-ray diagnosis of what was present in the mastoid, and our experience has been that if you rely on the roentgen-ray findings alone you will open a great many mastoids unnecessarily Another point to be emphasized in connection with mastoiditis is that in probably every acute middle ear inflammation congestion of the mastoid is present There are very few acute mastoids that should be opened before the lapse of a week or ten days from the onset of the middle ear disease In few acute mastoid cases will you lose the patient from not operating soon enough On the other hand, in many cases, especially of the pneumatic type, in which cells extend up over the zygoma and far back over the sinus, if you open the mastoid too early, a long and tedious convalescence follows In the presence of infected bone if you open the mastoid before there is a leukocytic walling off, you are never certain of being outside of the infected area That happens in many cases of mastoiditis where, in our anxiety, we open the mastoid too early If we wait until the process has limited itself, the patient will have a very quick convalescence In a fulminating case, in which the inflammation jumps from one area to another, with no tendency to limit itself, an operation will seldom save the patient Time and again, I have seen a mastoid opened on the basis of the roentgen-ray findings, opened in the congestive stage, with the result that a second operation had to be performed by some one else

DR CULLEN F WELTY, San Francisco An antrum of Highmore that was once infected will throw a shadow that cannot be differentiated from an active infection Doubtless, this is also true of the mastoid if it has been infected I agree with Dr McKinney as to the indications for operative intervention because by waiting the patient may die I believe in early operation Take away all the cells and there is no reaction, the temperature drops to normal and remains normal If temperature or pain persist, you have not taken away all of the cells Always bear in mind the cerebral complications that have existed with the other symptoms prior to operation Cerebral manifestations do not come on so quickly

DR G H MUNDT, Chicago The average acute mastoid case is safe until there is a breakdown of the intracellular septums It is not a matter of having a mastoid full of pus We should have two roentgenograms for comparison The roentgenogram is the most valuable single aid in determining whether or not to open the mastoid

DR WILLIAM B CHAMBERLIN Cleveland The differential diagnosis between acute mastoiditis and external otitis is not easy I have seen patients in the Politzer Clinic waiting for five days for a differential diagnosis to be made Dr McKinney did not, in several of these cases speak of the appearance of the tympanic membrane It is not always easy in external otitis to obtain a sufficient view of the tympanic membrane, and I wonder if some of these cases might not have been an extension from an external otitis rather than an extension along the external canal wall The roentgenogram may be exceedingly misleading anatomically Safety lies in not gaging operative intervention by the roentgen ray but in operating in every mastoid case as if the lateral sinus was as close to the exterior as possible

DR E LEE MYERS St Louis I agree with Dr McKinney It has been my experience since the first epidemic of influenza that too much attention cannot be paid to symptoms In children there may not be any redness of the drum membrane, and yet at operation all the cells are found necrotic I have had two cases of wryneck, one in a child 6 years of age, in which the wryneck was the only symptom There was no redness of the drum membrane, no running ear It proved to be a case of cerebellar extradural abscess Another patient had a perfectly normal ear, as far as acuteness is concerned The roentgen ray showed nothing in the mastoid or antrum It proved to be a fistula of the mastoid squama an inch and a half away from the antrum The fistula was as large as the end of my thumb The dura was protruding

DR RICHMOND MCKINNEY, Memphis, Tenn I realize that there is a possibility of mistaking a large boil for a mastoid abscess, but that was very carefully borne in mind All my patients gave a history of previous middle ear trouble In none of the cases reported was there occlusion of the external auditory canal, and the congested membrana tympani could clearly be seen

THE TREATMENT OF CHRONIC INDIGESTION IN CHILDHOOD*

JOHN LOVETT MORSE, A.M., M.D.
Professor of Pediatrics Medical School of Harvard University
BOSTON

Normally the digestive powers are equal to the work demanded of them, that is, the digestion of the food The equilibrium of the digestion may be disturbed either by a decrease in the powers of digestion or by an increase in the work to be done in digestion The decrease in the powers of digestion may be due to the action of diseases other than those of the digestive tract, to overfatigue, either physical or mental, or to diseases of the digestive tract The increase in the work to be done in digestion may be due either to too much digestible food or to indigestible food

The treatment in the first place evidently consists, therefore, in the exclusion or treatment of diseases other than those of the digestive tract and the removal or remedying of all causes of overfatigue, whether it be physical or mental It is surprising how often the source of a chronic disturbance of digestion will be found outside the digestive tract Chronic disease of the tonsils or the accessory sinuses is a very frequent cause of indigestion An unsuspected pyelitis is also not an infrequent cause Success in the treatment of chronic disturbances of digestion due to other diseases evidently cannot be hoped for, no matter how careful the regulation of the diet, until these diseases have been remedied Overfatigue is an even more common cause of chronic disturbances of digestion in childhood than are diseases outside the digestive tract The whole difficulty in many instances is due to overplay, overstudy, overexcitement or too late hours The removal of these causes will almost at once result in the disappearance of the indigestion Until these causes are removed, however, no improvement, or very little, can be expected, even with the most rigid attention to the details of feeding

Incidentally, it is important in all disturbances of digestion, no matter what the cause, to regulate exactly the intervals between feedings, to enforce regularity in feeding, and to forbid the taking of any food between meals It is extremely important to make sure that the child chews its food properly and never washes it down

* Read before the Section on Diseases of Children at the Seventy-First Annual Session of the American Medical Association, New Orleans April 1920

with liquid before it is properly masticated Regulation of these simple matters is, of itself, often enough to cure the milder disturbances of digestion in childhood

Primary disease of the digestive tract is very uncommon in childhood If there is disease of the digestive tract, it is almost invariably secondary to disturbances originating in the contents of the tract as the result of the ingestion of improper food or as the result of bacterial fermentation Treatment in the next place consists, therefore, in regulation of the diet by regulation of the amount of food and by the elimination of indigestible food The application of these general rules as to the regulation of the diet is all that is necessary in many instances, and certainly in the majority of the milder cases of chronic indigestion in childhood

In other cases, however, and certainly in most of the more serious disturbances of digestion, the conditions are more complicated There is an intolerance, more or less marked, for one or perhaps two of the individual food elements This intolerance is usually the result of overfeeding with this element in the past In the severer cases, intolerance for one or more of the food elements is almost always associated with fermentation in the intestinal contents as the result of abnormal bacterial activity This fermentation may take place in any of the food elements, fat, carbohydrates or protein Chronic indigestion in childhood may, therefore, be divided into indigestion with intolerance for fat, indigestion with intolerance for sugar, indigestion with intolerance for starch, indigestion with intolerance for protein, and indigestion with fermentation The borderline between simple indigestion with intolerance for one or more of the individual food elements and indigestion with fermentation is necessarily somewhat indistinct, because there is always fermentation going on normally in the intestinal contents The line between normal fermentation, fermentation with simple indigestion, and indigestion with excessive fermentation must evidently be very indefinite

SYMPTOMS

All types of chronic indigestion in childhood have certain general symptoms in common, such as loss of weight and other manifestations of disturbed nutrition Among these are dryness of the skin and hair, cold extremities, pallor, irritability, peevishness and disturbed sleep Other symptoms, which vary according to the type of indigestion, are diarrhea, constipation and the alternation of diarrhea and constipation The abdomen may be distended, normal in size or sunken, there may or may not be vomiting, fever of varying degrees may or may not be present None of these symptoms, are however, definite enough of themselves to justify a positive diagnosis as to the type of indigestion

DIAGNOSIS

While something may be told from the condition of the bowels, the odor of the breath, the condition of the tongue, the presence or absence of gas, nausea and vomiting, and the history in general, the diagnosis must be made mainly, however, on the results of the examination of the stools, as the different types of indigestion have characteristic stools The macroscopic examination of the stools is often sufficient to justify a positive diagnosis as to the type of indigestion present It should never be depended on alone, however, but should be verified by a microscopic examination, because the microscopic examination will sometimes show that the conclusions drawn from the macroscopic examination were not justified The microscopic examination of the stools should, therefore, always be made This is not a difficult matter and requires but a few minutes

A small portion of the stool is spread on a slide and stained with either Lugol's or Gram's solution Starch granules stain blue or violet Another portion is spread on a slide and stained with a saturated alcoholic solution of sudan III The neutral fat drops and fatty acid crystals stain red Soap crystals do not stain with sudan III A drop of glacial acetic acid is then allowed to run under the cover glass The specimen is then heated until it simmers This changes the soap into fatty acids, which then stain If it is desired to determine whether the fat is in the form of neutral fat or fatty acids, another specimen is stained with carbolfuchsin This does not stain neutral fat, but stains fatty acids a brilliant red and soaps a dull red [1]

The bacteriologic examination of the stools is not usually necessary, but in certain cases is absolutely essential, as a positive diagnosis is impossible without it

THE STOOLS IN INDIGESTION

The stools vary decidedly in the different types of indigestion

Fat Indigestion—The stools are usually large, semisolid, gray, acid in reaction, and often contain a considerable amount of mucus They are sometimes dry, hard and gray or white More often they are loose, frothy, gray and extremely acid The odor is that of butyric acid, and they contain considerable amounts of mucus Sometimes the fat is in the form of small, soft curds, or the stools appear oily, as in babies Microscopically, the fat is present in various forms, rarely as neutral fat, more often as fatty acids or soap

Sugar Indigestion—The stools are loose, yellow, sometimes green, frothy and acid in reaction The odor is that of acetic or lactic acid The stools are very irritating to the skin, and often contain mucus Microscopically, little abnormal is seen, except that sometimes, as the result of the diarrhea, they show unabsorbed fat and undigested particles of food which have been hurried through the intestine

Starch Indigestion—The stools are loose, yellow-brown, sometimes green, often frothy, and acid in reaction The odor is acid, usually being that of acetic or lactic acid, but sometimes, if there has been a change in the starch to fat, that of butyric acid If very acid, the stools are irritating to the buttocks, but usually are not They occasionally contain mucus and almost invariably considerable amounts of starch, either unchanged or partially converted into dextrin

Protein Indigestion—The stools are loose, brownish, and alkaline in reaction The odor is foul or musty They usually do not contain mucus

Indigestion with Fermentation—The characteristics of the stools are the same as in the other types of indigestion, with the addition of those due to the fermentation They are likely to be frothy and to contain more mucus The acidity or alkalinity of the reaction is increased, according to the type of fermentation present, and the odor is more acid or putrefactive

BACTERIOLOGY

In general, the bacteriologic examination of the stools is not of great importance in diagnosis

1 Further details are given by Morse J L and Talbot F B Diseases of Nutrition and Infant Feeding, New York, the Macmillan Company, 1920 p 94

Usually, no additional information is obtained from it The intestinal flora is, of course, either fermentative or putrefactive, that is, one which forms acids or alkalis from the intestinal contents The type of the intestinal flora can always be determined from the reaction of the stool In the acid stool of carbohydrate indigestion, however, the presence or absence of organisms of the gas bacillus group is of considerable importance in indicating the form of treatment The determination of the presence or absence of the gas bacillus by the fermentation test is not difficult, and can be carried out by any one in his office without special training [2] In protein indigestion there is an excess of putrefactive organisms Porter and his co-workers [3] have recently developed a method for the recognition of this type It is very possible that organisms of the butyric acid group or *Bacillus acidophilus* may be of importance There are, however, no easy methods for recognizing these organisms and no specific treatment, if they are present

TREATMENT

There is no place for the so-called digestants in the treatment of chronic indigestion in childhood There is probably never an insufficiency of either hydrochloric acid or pepsin and, as pancreatin is destroyed in the stomach, it cannot possibly be of any use The general methods of treatment have already been mentioned Further treatment, therefore, consists primarily in regulation of the diet to fit the digestive capacity of the individual child The element or elements of which it cannot take care must be cut down to the point where it can take care of them This point can be determined only by the examination of the stools The deficiency in calories, brought about by the cutting down of the amount of one or more of the food elements, must be made up by increasing the amount of the others The amount of the element that is causing the trouble must be increased as fast as the increasing tolerance will allow It is not enough in severe cases of chronic indigestion, due to intolerance of one or more of the food elements, to give general directions as to the diet The diet must be laid out explicitly, and the number of grams of the offending food element allowable daily must be definitely stated The number of calories which the child needs must also be indicated A list showing the caloric value and the content in grams of the various food elements in the foods allowed must be given to the parents and its use explained In my experience, almost all parents are intelligent enough to use these tables I have had no difficulty in getting their interest and cooperation

In the cases in which there are marked clinical evidences of fermentation, bacteria undoubtedly play an important part in the production of the symptoms They unquestionably also play a part in the cases in which the evidences of fermentation are less marked, because bacterial fermentation is always going on in the contents of the gastro-intestinal tract under both normal and diseased conditions What proportion of the symptoms in a given case is due to bacterial fermentation and what proportion to disturbance of the chemical processes of digestion is, however, almost impossible to determine It is impossible, moreover, to know whether the trouble was originally due to bacteria or to disturbance of the chemical processes of digestion In general, however, it is probable that the difficulty was not originally due to bacteria as it is impossible to implant permanently any organisms in the intestine by giving them in the food Fortunately, it is not important to know which is primary, because the two factors are finally active in every case

Whether primary or not, however, abnormal bacterial activity must be stopped It is impossible permanently to change the intestinal bacterial flora by giving bacteria by the mouth, although the flora may be temporarily somewhat modified, if the bacteria are given continuously The intestinal flora can be changed by changing the composition of the food, that is, the flora may be changed from the acidophilic to the putrefactive by changing the composition of the food, and vice versa Cutting down the proportion of the carbohydrates and increasing that of the protein in the food changes the flora from fermentative to putrefactive, and cutting down the proportion of protein and raising that of the carbohydrates changes it from putrefactive to fermentative This can be proved by bacteriologic examination of the stools, but is shown equally well by the change in the reaction of the stools, the stools being acid when the bacterial flora is mainly fermentative, and alkaline when it is mainly putrefactive Organisms growing on fat have relatively little to do with fermentation in the intestinal tract, but the products of their activity increase the acidity of the stools Treatment by regulation of the diet on the indications furnished by the examination of the stools thus not only aids the weakened digestive powers but also changes the bacterial flora

When the organisms of the gas bacillus group are the cause of the fermentation in the intestinal contents, something may also be done to limit their activity by the administration of organisms that produce lactic acid The best type for this purpose is probably *Bacillus bulgaricus* It is more effective when given in the form of buttermilk than in tablets or cultures, because it is numbers that count, and there are infinitely more organisms in buttermilk than in any tablets or little tubes of cultures Furthermore, the buttermilk contains considerable amounts of lactic acid, which is of itself inimical to the growth of the gas bacillus and putrefactive organisms The lactic acid forming organisms are also sometimes of benefit in the treatment of putrefactive conditions It must be remembered, however, that the lactic acid organisms cannot change the bacterial flora permanently This can be done only by so changing the diet as to change the character of the culture medium in the intestine It is doubtful whether the growth of other pathogenic organisms can be influenced by the administration of any other organisms in the food

There is no place for drugs, except for the temporary relief of symptoms, in the treatment of chronic indigestion in childhood Cure can be brought about only by regulation of the life and diet In severe cases the most minute attention to every detail is absolutely essential In these cases recovery is a matter of many months, and often of years, while relapses are frequent Recovery is, however, almost always possible, provided the treatment is carefu[illegible] and [illegible]t [illegible] a sufficiently long ti[illegible]

ABSTRACT OF DISCUSSION

DR LEWIS WEBB HILL, Boston I have seen many of these patients treated by Dr Morse His results are equaled by few, partly because he has had a great deal of experience, but mostly because he is willing to take infinite pains That is the most important thing to remember in dealing with these chronic feeding cases, to take time with them, to pay the closest attention to details and to see the child often Even then you will often not get nearly as good results as you would like to get The relation of the intestinal bacteria to the food in the intestine must be considered Escherich, in 1886, first brought forward the very important fact that the types of intestinal bacteria were dependent almost entirely on the food supply, and that if you changed the character of the food supply, the kinds of bacteria in the bowel could be changed accordingly He distinguished between two broad groups of intestinal bacteria, the putrefactive, which live on protein food and the fermentative which live on carbohydrate food If the intestine is infected with fermentative, carbohydrate splitting bacteria, withdraw the carbohydrate food on which they live and substitute protein food, in order to do away with the type of bacterium that is causing the trouble If the intestine is infected with putrefactive protein splitting bacteria withdraw the protein food and substitute carbohydrate food, in order to change that type around This conception is most important in infant feeding not only in cases of chronic indigestion in older children, but in the case of babies as well There is absolutely no use in dealing with these cases to try to temporize One should figure out very accurately what the child is going to have, and give the mother an ironclad diet list All directions should be written I use a card about five by eight inches, with the meal times written on it breakfast luncheon dinner and supper, and then I put down under each one of those headings exactly what the child is going to have for each meal That helps a great deal The mother can tack it up in the kitchen or pantry, and follow it from day to day When the diet is changed a new card can be given Never give dietary directions by word of mouth for such cases as these, always write out the directions Trust nothing to the judgment of the mother

DR C G GRULEE, Chicago Dr Morse has made an ironclad statement, that you cannot introduce bacteria into the bowel by giving them by mouth That statement should be questioned I do not know how you are going to account for a certain phenomenon unless you admit that bacteria when introduced by mouth do show evidences of growth in the intestine Typhoid is caused by the introduction orally of the typhoid bacillus and certain types of dysentery are caused by the introduction by mouth of certain types of the dysentery bacillus I suppose Dr Morse meant to say that by the introduction of the lactic acid bacillus by mouth we could not obtain any therapeutic results in the intestine My experience has been rather contrary to that It is very hard to say in a given case to what results are due because you will probably use several therapeutic agents, but there is no scientific reason why the lactic acid bacilli introduced by mouth cannot be taken up in the intestine Dr Morse may say that the gastric juice is bactericidal in action It probably is, under normal conditions, and under abnormal conditions it probably is not The latest bacteriologic results, as obtained by the duodenal tube, and examination of the gastric contents, show that there is a very definite relation between the bacteria found in the stomach and in the duodenum, with the various types of nutritional disturbance

DR L T LE WALD New York I endorse everything Dr Morse said My work in studying children has been along the line of the roentgen-ray diagnosis in cases of indigestion which do not yield to ordinary methods of treatment Unless one takes into account some of the congenital anomalies of the gastro-intestinal tract treatment of what is considered a digestive disturbance will fail to relieve There may exist a definite obstructive lesion, that can only be dealt with by knowing the exact nature of the mechanical obstruction In a case of persistent vomiting we found a congenital hernia of the diaphragm, with the stomach in the chest cavity, and part of the time some of the stomach would protrude into the abdominal cavity, and produce a partial obstruction, and at other times it would slip entirely up into the chest cavity, and the child would go on without any vomiting for a period of several weeks or months That condition of recurrent digestive disturbance was immediately explained by the roentgen-ray examination, and was relieved by an anastomosis between the stomach and the small bowel, the only case on record in which the condition has been successfully relieved by a palliative operation of this sort A case of congenital syphilis of the stomach, with a very marked narrowing of the entire stomach lumen, would never have been recognized in any other way

DR ISAAC A ABT Chicago I agree with everything Dr Morse said I was particularly impressed by the fact that he recognizes that indigestion may be produced by constitutional disturbance I doubt whether there is such a condition as indigestion pure and simple I believe that indigestion is but one step in the general metabolic disturbance If you are dealing with a baby who is suffering from an excess of starch, he first possibly has indigestion but very soon he has some more profound constitutional disturbance He has an injury produced by starch that may show itself either as an atrophy, or possibly with a general hydremia, so that I doubt very much whether one should stress entirely the indigestion without considering the nutritional side the general metabolic disturbance It is not such a complicated matter to cure or to remedy these food disturbances It is simply a matter of finding out what the difficulty is, and diminishing the amount of food ingested, or altering the character of the food entirely Examination of the stools in my experience is not the most important element in diagnosis A little fat may be found in a perfectly normal stool, or a little starch even, without producing any pathologic symptoms

DR JOHN LOVETT MORSE, Boston If I had read the whole of that part of my paper dealing with bacteriology, I do not think that Dr Grulee would have criticized I do not think that his arguments apply I was talking about bacteria in the intestinal contents Typhoid fever is a systemic infection and in infectious diarrhea the bacteria invade the intestinal wall I am still prepared to defend my statement that it is impossible permanently to implant any bacteria in the intestine They will stay only as long as they are given unless the diet is changed If the diet is changed, it is not necessary to give them As to the examination of the stools If the findings in the stools are interpreted correctly, they are often of great assistance If the examiner thinks that a few fat globules mean fat intolerance or a few starch granules intolerance for starch, he will be misled The child the diet the number of stools and the life must also be considered That is, brains are necessary here, as elsewhere, in medicine

---

Infant Welfare and the General Practitioner—There is no reason why the average practitioner who is always an obstetrician and pediatrician as well, should not conduct a well-baby clinic in his private work as an integral part of his practice There is no reason why he should deny the new-born child that measure of medical supervision which to a greater or less degree he accords the mother during the nine months preceding the birth of the infant The goal of good obstetrics should be not only the delivery of the living child but that the child should continue to possess the attribute of living Prenatal care by the average practitioner, even if many times indifferent and inefficient is recognized by him as an inherent right of the expectant mother Equally rightful is the prerogative of the infant during its precarious first year to have its share of medical supervision The socially-minded individual is largely so through instinct Like poets, and to be more concrete like the successful public health nurse they are born and but rarely made Yet the dormant and potential social instinct may be awakened into a dynamic force through stimulation and cultivation—J S Wall *Am Child Hyg A Tr* Nov 11-13, 1919

MANAGEMENT OF ACUTE APPENDICITIS DEVELOPING IN LATTER WEEKS OF PREGNANCY

REPORT OF CASE TREATED BY CESAREAN SECTION AND APPENDECTOMY *

NORBORNE PAGE COCKE, M D
AND
JAMES M MASON, M D
BIRMINGHAM, ALA

For the purpose of discussing the various questions which arise in the management of acute appendicitis occurring at or about the termination of pregnancy, the following case, developing within the last three weeks of pregnancy, treated by cesarean section and appendectomy with drainage, is reported

REPORT OF CASE

Mrs F W, aged 25, primigravida married two and one-half years, was first seen in October, 1919, after having passed through six months of pregnancy uneventfully Her last period began on April 21, 1919 and labor was expected between Jan 25 and 28 1920 The past history was unimportant except that the patient had always suffered from slight indigestion, but never from any pain or other symptom referable to the appendix Physical examination and pelvic measurements showed her to be normal in every way Oct 29, 1919 she developed headache, nausea, 'heartburn" vertigo and blurring of vision The urine contained a small quantity of albumin and a moderate number of hyaline and granular casts The systolic blood pressure was 115 There were slight pains in the lower part of the abdomen She was kept in bed on milk diet and was subjected to free purgation All symptoms cleared up rapidly, and on the tenth day the urine was free from albumin and casts The systolic blood pressure registered 100 The attack was considered to have been one of toxemia of renal origin

January 4 patient was awakened about 1 a m with nausea and vomiting, she was seen at 4 a m The pulse and temperature were normal, she complained of slight pains over the lower abdomen, uterine contractions could be seen and felt There was no vaginal discharge She was given ⅛ grain of morphin sulphate and 1/200 grain of scopolamin hydrobromid hypodermically, and soda water by mouth

At 9 a m, vomiting was persistent and severe, the temperature and pulse were normal, no tenderness was elicited over the abdomen, but the patient complained of intermittent cramping pains Milk of magnesia, one-half ounce, was given, and this was followed by a soapsuds enema with only fair results The systolic blood pressure was 105, the urine showed a few hyaline casts but no albumin, the leukocyte count was 21,000 The vomiting continued throughout the day, and by 9 p m the temperature was 99 2 and the pulse, 110 The cramping pains were still present

January 5 at 9 a m, all symptoms had improved except the vomiting The vomitus contained bright red blood and intense burning was complained of along the course of the esophagus In the evening some tenderness was noted in the right lower quadrant of the abdomen and the leukocyte count was 22 000 Vaginal examination revealed the head well down in the pelvis, with the os thick and admitting only one finger

The continuation of vomiting with a high leukocyte count and the absence of definite onset of labor together with a tendency to locate pain in the right iliac fossa raised the question of appendicitis

On the morning of January 6, the temperature was 99 and the pulse, 90 There was no abdominal pain or tenderness The vomiting had continued, however and the leukocyte count was 21,500 The urine was still free from albumin, it contained only a few casts and no pus or blood

At 3 p m a consultation was held After considering the history and after careful examination with findings about the same as noted above, we made this analysis of the situation

1 Although the patient had suffered from toxemia of renal origin two months before the present urinary findings did not justify such a diagnosis at this time

2 The persistent vomiting, with high leukocyte count, and with a tendency to refer pain and tenderness to the right iliac fossa was very suggestive of appendicitis even in the absence of material elevation of temperature or increase in pulse

3 The patient's general condition, with incessant vomiting, demanded the termination of the pregnancy

4 We decided on cesarean section to be followed by examination of the appendix with its removal if found diseased

At 6 p m January 6 sixty-six hours after onset, under gas-oxygen anesthesia the uterus was delivered and carefully packed off from the abdominal cavity The fetus was extracted the uterine wound closed, and the uterus returned to the abdomen and still further protected by packs The abdominal incision was retracted and the appendix located well down in the pelvis It was acutely inflamed, almost gangrenous covered with lymph but free from adhesions The appendix was removed a large cigaret drain was carefully placed through a stab wound in the right iliac fossa, and the laparotomy wound was closed

The patient made an uneventful recovery

IMPORTANCE OF PROMPT OPERATION

The frightful mortality of neglected appendicitis is recognized by every one, and the advisability of prompt operation on the development of an acute attack in the nonpregnant patient needs no discussion at this day

The higher mortality which has been attributed to acute appendicitis during pregnancy is not to be charged to the appendicitis or to the pregnancy so much as to the failure to recognize the disease promptly and to treat it along well established surgical lines

The failure to recognize the disease in the latter months of pregnancy may be due to difficulty in diagnosis, which is brought about by the enlargement of the uterus, with attendant changes in the relations of the intra-abdominal organs

The delay in prompt operation is most often due to the obstetrician's hesitancy in undertaking any serious operation which may be followed by abortion or premature delivery, and, to a very great extent, to the attitude of those obstetric teachers, who, until recently, have held that while operation is indicated in all cases occurring in early pregnancy, only in perforative or gangrenous cases should operation be performed during the last four months

No teaching more dangerous to the pregnant woman with appendicitis could be held, and we heartily approve the position of De Lee,[1] who states in his latest work that "appendicitis during pregnancy should always indicate immediate operation, and that even in cases of doubt, operation is the safer course," of Kelly [2] that "because of the well recognized clinical severity of any attack of appendicitis associated with suppuration during pregnancy, prompt interference is demanded as soon as a diagnosis is clearly made," and of Hirst,[3] who urges prompt operation and points out that "if an attack occurs late in pregnancy, in con-

sequence of intense congestion and increased intra-abdominal pressure, it is likely to be very severe, with early virulent peritonitis" Findley,[4] in a paper before this section in 1912, quoted the statistics of Wagner, who gives the mortality in nonoperative severe cases complicating pregnancy as 77 per cent, as contrasted with 67 per cent in cases of all grades of severity in which operation is performed within the first forty-eight hours, and expressed the belief that reduction in mortality would no doubt occur if these patients were operated on within the first twenty-four hours

John B Murphy, in discussing Findley's paper emphasized two facts First, when the condition was diagnosed early and remedied early the mortality was almost nil, second, when the condition was diagnosed late the endeavor to remedy was also late, the mortality was colossal He pertinently asked "If we can diagnose the condition early, what is the excuse for waiting?"

In the earlier months of pregnancy, appendicitis is not infrequent, its diagnosis offers no special difficulties, and operative technic does not differ from that employed with the nonpregnant Abortion occurs very infrequently, and there is little likelihood of its happening with the patients operated on early, without drainage, and with the minimum amount of intra-abdominal manipulation

Reported cases of acute appendicitis developing at or very near the end of pregnancy or with the onset or in the course of labor are rare, and the difficulties of diagnosis may be great

CASES IN THE LITERATURE

In reviewing the literature as found in the abstracts of THE JOURNAL since 1912, only four such cases are noted, and only two of these are abstracted or reported in full

In Wallace's case[5] at full term pregnancy, the attack began on Saturday night and was thought to be the onset of labor, on Sunday afternoon appendicitis was diagnosed, on Monday at 1 30 p m, about forty hours after onset, the perforated appendix was removed and drainage was instituted On Tuesday at noon, twenty-two hours after the operation, labor set in and was completed at 12 30 Uneventful recovery took place

In Grattan's case,[6] in which the expected date of confinement was July 18, the onset of the attack occured at 1 a m, July 15, with epigastric distress, at 7 a m, July 17, abdominal pain in the right iliac fossa caused suspicion of appendicitis, also at the same time definite dilation of the cervix, with characteristic intermittent girdle pains indicated the onset of labor Operation was performed, 12 30 a m, July 18, about seventy-two hours after onset, a gangrenous appendix was removed, with drainage of the abdomen Labor pains came on half an hour after the regaining of consciousness, and labor was completed at 10 a m, the 18th The mother recovered after a very stormy convalescence, but the baby died

PROBLEMS THAT ARISE

When appendicitis develops at or near the end of pregnancy, several serious problems arise (1) that of diagnosis, (2) the question of operation, (3) whether or not pregnancy shall be terminated, (4) the question Is the better plan to empty the uterus before removing the appendix, or to remove the appendix first? (5) What method shall be employed in terminating pregnancy?

Diagnosis—Some time must inevitably be lost in deciding that any pain present is not due to the onset of labor alone, but may be due to some cause outside the uterus By careful examination, one must exclude hematogenous infection of the kidney, pyelitis, ureteral obstruction, gallbladder disease, and inflammatory affections of the appendages Repeated observations must be made of pulse, temperature and leukocytes Any tendency whatever to refer the pain to the right iliac fossa, or the eliciting of any tenderness or rigidity in this region, must be given special weight in view of the fact that these signs are frequently obscured by the increased size of the uterus

Operation—From what has gone before, we have made our position clear that operation is indicated when a diagnosis has been clearly made In some instances, operation will, of necessity, be exploratory in character and may have to be undertaken on the ground that severe, persistent abdominal pain, not relieved by the usual simpler remedies, demands operative investigation, bearing in mind the opinion of De Lee, already quoted, that in case of doubt operation is the safer course

Shall Pregnancy Be Terminated?—At this late period, the life of the child is not endangered by terminating pregnancy, and we believe that this should be done

Neither Cragin[7] nor Williams[8] favors the emptying of the uterus from above or below in dealing with the appendix

Hirst[3] thus states his position

> If there is any reason to suspect suppuration the median incision is required in operating after the fourth month and the uterus should be lifted out of the abdominal cavity to detect possible areas of suppuration deep in Douglas' pouch or on the left side If it is necessary to deliver the uterus from the abdomen after the seventh month it should be emptied by cesarean section before it is returned If drainage is required, the uterus should usually be amputated

As to whether the uterus should be emptied first or the appendix removed, it seems to us better to terminate labor first and remove the appendix immediately thereafter All writers agree that the removal of an appendix in the presence of the full term uterus is usually very difficult Furthermore, if the placing of the drains is necessary, the subsequent change in intra-abdominal relations brought about by uterine contractions, and by the diminution in the size of the uterus after delivery, may so disturb the operative field as to cause the spread of infection to all parts of the abdomen, while the maintenance of a quiescent condition would allow the formation of protective adhesions with subsidence in intraperitoneal inflammation With the uterus empty and contracted, the appendix may be located and removed with greater ease, and there will be but little danger from interference with the peritoneal toilet after the operation is completed

Method by Which Pregnancy Shall Be Terminated—No slow or uncertain method should be employed While a slowly induced labor is in progress, suppura-

tion and peritonitis may be progressing much more rapidity If the patient is a multipara and the obstetrician is sure that he can accomplish delivery promptly by accouchement force, this may be considered If the patient is a primipara, or if there is any doubt about immediate delivery in the multipara, cesarean section, with appendectomy, should be performed

CONCLUSION

We are entirely opposed to the teaching that operation in the latter months of pregnancy should be reserved for perforative or suppurative cases

The pregnant woman at this period of pregnancy should be given the same chance of recovery that is offered the patient who develops appendicitis in the earlier months, namely, an early diagnosis and prompt removal of the appendix, not after but before perforation, gangrene or peritonitis has developed

Jefferson County Bank Building

ABSTRACT OF DISCUSSION

DR ARTHUR H CURTIS Chicago I agree with Dr Mason that every actively diseased appendix must be removed irrespective of the stage of pregnancy Not only the acute appendix, but every appendix should be removed, because one never can tell when serious complications may arise As to the advisability of performing a cesarean section on these patients If the appendix is accessible, in the absence of distinct contraindications for cesarean section, I would be inclined to leave the uterus without manipulation I see no reason why if we close the abdomen thoroughly and carefully, labor should not go on in a normal way If we perform cesarean section we are apt to have trouble from unsatisfactory closure of the uterine or abdominal incision In such cases it would be a pretty good plan for the doctor to consider local anesthesia If ever there is need for local anesthesia, it is in such cases as these If we decide not to take out the fetus and if the uterus is left alone, we should be extremely careful in the closure of the abdominal wound Under such circumstances it is best to use strong tension sutures

DR FRANCIS LE S REDER St Louis It is well to give instructions to the woman who expects to become pregnant to subject herself to the most thorough examination before conception occurs If there are any evidences of former attacks of appendicitis, it is better to remove the appendix in the interim than to allow her to go on and take this risk Up to the fourth month of pregnancy the appendix can be removed with comparative safety no matter what its condition From the fourth month to the seventh month there is some danger From the seventh month on, the situation is a very complicated one and calls for the exercise of good judgment on the part of the attending physician in determining the treatment It has been my experience that appendicitis at this time in a pregnant woman is not of the same virulence as when it occurs prior to that time Although I have urged operation in a number of such cases, it was declined and these women went on to full term without any untoward consequences If it is extremely dangerous to this woman s life to allow the condition to go on what should be our method of procedure? I am inclined not to be hasty, to watch and wait as long as the patient remains within the limits of safety as far as your surgical judgment will dictate no surgical intervention becomes necessary If the case goes on to suppuration, and the pus can be palpated in the culdesac of Douglas, puncture through the rectum and evacuation of the pus, will sometimes suffice and not disturb the pregnant uterus I have had two successful cases treated in that way Ventral hernia is a secondary matter The safety of the woman must be considered primarily The hernia can be repaired later when the woman is in a safe condition for such repair

DR DAVID ROSS, Indianapolis Whether to operate for appendicitis during pregnancy is a matter of individual judgment However, what impressed me most in the paper was the suggestion to do a cesarean section in cases of rupture of the appendix Some years ago the late Dr Beckman answered the question 'When is it safe to do a multiple operation?' by saying that he could tell better when it was safe not to do one He advised never to operate in the presence of an infection or even when infection was suspected I certainly would not submit any woman to a cesarean section in the presence of a ruptured appendix

DR JAMES M MASON Birmingham Ala One-half the textbooks on obstetrics advise that when appendicitis occurs early in pregnancy the appendix should be removed the other cases should be left alone unless suppuration occurs My position is—no matter what the stage of the pregnancy, if appendicitis develops the pregnant woman is in as dangerous a condition as the nonpregnant woman would be No one can tell which appendix is going to rupture and which is not The accepted surgical decision is that patients with acute appendicitis should be operated on as early as possible Murphy said we can diagnose the cases early and we should operate early At the present day cesarean section is exceedingly simple and safe If you get a case of acute appendicitis in a pregnant woman and want to terminate the pregnancy that way it is a simple matter to open the abdomen close the uterine wound remove the appendix and if there is no suppuration close the appendiceal wound Late in pregnancy a few hours before labor is going to come on it is very much safer to do as Hirst says, open the abdomen remove the appendix amputate the uterus with every chance of the patient getting well with free abdominal drainage If you leave the uterus intact and do an appendectomy with drainage there is great risk of labor coming on two or three days afterward and to have a localized peritonitis where the contractions of the uterus may break up adhesions If you do a transperitoneal cesarean section, there is no reason why an extraperitoneal section cannot be done and appendectomy carried out As for the use of local anesthesia it has a great place in cesarean section but gas oxygen especially if the woman is suffering from nausea is the best anesthetic to use Concerning the virulence of the infection, the cases I have seen early in pregnancy were subjected to operation before they were far advanced However Murphy, Kelly Hirst and many others have said that if acute appendicitis develops late in pregnancy we may look for the rapid spread of virulent appendicitis I believe that if appendicitis occurs in the last month of pregnancy termination of labor and removal of the appendix is indicated

CONTROL METHODS IN THE TREATMENT OF DIABETES MELLITUS*

SOLOMON STROUSE M D
CHICAGO

This discussion presents the treatment of diabetes mellitus from a point of view not usually employed in consideration of the subject Diabetes mellitus is a much misunderstood disease, but the difficulties of treatment are often greatly exaggerated Difficulties have arisen mainly for two reasons First, the course of the untreated or poorly treated disease is confounded with the results of treatment, second, metabolic investigations have been confused with practical therapy Modern improved methods of treatment have increased the length of life of the diabetic and have cleared the clinical picture of the disease as treated under improved conditions The improved methods mainly have been applications of the metabolic investigations of laboratory and ward, but successfully to treat an individual case does not necessarily imply knowledge of these investigations if their appli-

* From the Medical Clinic Michael Reese Hospital
* Read before the Chicago Medical Society May 5 1920

cation is understood A patient with diphtheria may recover even though the physician who administers antitoxin never heard of Behring or knew that George Washington died of diphtheria

One reason why the treatment of diabetes has been difficult is the apparently inherent difficulty in conceiving of dietetics as a practical procedure on a scientific basis Diabetes is a functional disease of the pancreas primarily involving carbohydrate metabolism and ultimately extending to the metabolism of fat and protein and treatment depends on the degree of functional impairment A natural analogy to cardiac conditions is immediately seen In aortic insufficiency, for instance, there is no cause for treatment until there is an actual functional disturbance of the heart as evidenced by signs of decompensation, either early exertion dyspnea or a final complete break, perhaps involving all the organs of the body No one would attempt to treat a patient with an aortic diastolic murmur who has no signs of decompensation in the same way as he would treat the same patient two or three years later with a break

The only essential difference in therapeutic principle between diabetes mellitus and aortic insufficiency is that diabetic therapy is practically confined to food, and diet is traditionally more difficult to understand than is digitalis Just as there are methods of control in the handling of cardiac cases, so there are similar, if not identical, methods of control in the treatment of diabetic patients methods of control which are simple and logical, which change the treatment of the disease from a hit and miss affair with uncertain results to a scientific procedure of almost sure results in most instances I shall discuss these methods of control and show by case reports how improved therapeutic results can be obtained by the practical application of some surprisingly simple procedures

IMPORTANCE OF THE HISTORY

Even at the risk of repeating facts known to all, or even of laying undue emphasis on what may seem apparent, experience leads me to say that the first and most important method of control lies in a careful history and physical examination In this respect diabetes differs in no way from other diseases of internal medicine, and yet time and again I have seen treatment of the diabetic undertaken by the physician who had made no effort to ascertain any facts in his history, which from the very nature of things must have influenced his treatment had they been known For example, analysis of case records shows that diabetes in the young is usually the severest type of the disease, but that when the young diabetic has a family history dotted with diabetic relatives his chances are improved Further analysis shows that the later in life the disease starts the milder it is likely to be, and a still more important fact can be brought out from knowledge of the length of time a patient has been sick, the nature of his symptoms, and the kind of treatment he has undergone To emphasize these points, I will cite two cases

CASE 1—A man, aged 22, was seen in February Sugar was discovered accidentally by his father, a physician who noted a markedly increased appetite and increased thirst when the boy came home from college for a vacation The specimen showed a specific gravity of 1 050 an excretion of about 6 liters containing 8 per cent sugar and a trace of acetone The blood sugar was 0 28 per cent Everything pointed to a severe case, but his history showed, first a family history of diabetes, and secondly, a short duration of his own symptoms On the basis of these two facts I volunteered the information that treatment would not be difficult and, indeed, it took only three days to get this boy sugar free and to keep him so

CASE 2—Contrast with this a woman seen several years ago, who on the way from New York developed erysipelas When I saw her she was quite sick, with high temperature, fast pulse and marked toxic symptoms The urine contained more sugar, more albumin, more acetone and more diacetic acid than I had seen in a long time The woman was too sick to give much history, and the natural interpretation of the case would have been that some of her urinary abnormalities had been caused or increased by her erysipelas However, to quote her husband, "she'd had all those things for years and had remained in apparent perfect health despite this abnormal urine" Practical judgment based almost entirely on history then indicated the therapeutic procedure, which was definitely to make no radical changes in the woman's method of living She recovered However, had we not taken the history into consideration, and had we instituted treatment on the procedure indicated by the urinary findings alone, it seems to me we would have spoiled any chances for recovery this woman may have had

PHYSICAL STATUS OF THE PATIENT

In recent years when men have spoken and written of this and that kind of "cure" for diabetes, it has been my experience that dangerous practices have resulted from the indiscriminate use of any particular method for all patients with diabetes It is no more logical to give every diabetic a set of pink and blue pills than it is to give every diabetic the same diet list When starvation first became fashionable other things were neglected, and in the hands of men less skilled than the advocates of the starvation method many a patient with exophthalmic goiter, pulmonary tuberculosis, nephritis or obesity was made definitely worse No treatment of diabetes should ever be started unless everything possible is known about the physical status of the patient The individual with a big reserve of fat offers an entirely different therapeutic problem than the thin, highly nervous woman with tachycardia, or the older person with arteriosclerosis and albuminuria The records of two patients will illustrate how the physical status indicates the proper procedure

CASE 3—A man, aged 50 who had diabetes of five years' standing, had within the last few months lost an undue amount of weight and was coughing Physical examination revealed a rather large area of pulmonary tuberculosis in the right lung He was put in the hospital and his diet was never allowed to go beyond his maintenance level (Mosenthal) He was kept at complete rest and very gradual methods were employed to reduce the glycosuria It took a long time but within four weeks the pulmonary condition was quiescent, the urine was normal, and his general physical condition excellent He left the hospital in better shape than he had been in for years But several months later, in his own Canadian town, he transgressed his diet, and sugar reappeared in his urine To quote the patient's words, the doctor did not examine him but starved him to death The expected happened He became sugar free, but his cough and pulmonary findings increased He lost weight, and when I saw him a month later he was a wreck of his former self

Another case illustrates the value of the physical examination

CASE 4—A stout, highly nervous woman, aged 40 with diabetes of ten years' standing, with albuminuria and acetonuria asked about five years ago that I put her under the starvation treatment The result was a quick and dangerous acidosis, to overcome which glycosuria was again produced, and the patient was in no better condition than before treatment was started A few months ago the same patient was

subjected to an intense nervous shock and decided to enter the hospital for a period of complete rest Because of her excess weight the only food change made was a complete elimination of fat, with the result that she became sugar free, acetone free and albumin free, for the first time in ten years This was unquestionably due as much to the complete mental and physical relaxation of the high tension patient as to the removal of fat from her food

OTHER ELEMENTS TO BE CONSIDERED

If these two factors in treatment, namely, history and physical examination, are clearly understood and their importance not neglected, the rest of the treatment of the diabetic is a matter of careful correlation of clinical condition, food intake, and the results of some simple laboratory findings The identification of the reducing substance as glucose is necessarily the first step in the laboratory work The amount of the reducing substance is even less important than certainty regarding its nature The presence or absence of signs of acid intoxication then follows, and the tests for this are easy clinical matters The sodium nitroprussid and ferric chlorid urinary tests, with or without ammonia determination, give information of the greatest value But supplementary evidence of acidosis can be obtained by use of the Marriott apparatus for testing alveolar air This test is clinically accurate, and is simpler to perform than a stain for tubercle bacilli or even than an accurate white count

As a matter of fact, the treatment of diabetes needs no more elaborate laboratory study than is here outlined As I have already mentioned, we must distinguish between the scientific study of the metabolic disturbance in the disease diabetes and the actual treatment of the individual patient with diabetes mellitus The former requires well equipped laboratories, well trained technicians, and men interested in and anxious to pursue such a study But in practice such a study is actually far removed from the absolute needs of the patient It is true that the advance of knowledge concerning the disease depends on such intensive investigations, but it is not necessarily true that the course of treatment of the average diabetic need be influenced by the lack of opportunity for this intensive work

Nothing has been said concerning blood chemistry, but the study of blood sugar and of other constituents of the blood in diabetes has formed a chapter of the greatest interest and certainly has furnished information of the greatest value Hyperglycemia is always present in a true diabetic when he is passing sugar, and a study of the blood sugar will show that in the course of treatment blood sugar changes are likely to precede urinary changes and in this respect furnish information of actual practical therapeutic value The same thing may be said of a study of the retention products causing acidosis in the diabetic And the blood sugar study has become so simplified of late that it can be carried on in a comparatively easy way in a well equipped office

Although it is not my purpose to extend this discussion into the details of management of the individual diabetic, I will abstract two cases in which therapy was improved by ascertaining relative values

CASE 5.—A lad aged 15, living out of town, who had been under observation for two years and was exceedingly intelligent, found that a sudden drop in his tolerance had occurred which he was unable to explain He sent his diet list and twenty-four hour urine The urine contained sugar, but no acetone bodies Analysis of the diet compared to his tolerance diet when he left the hospital two years before showed considerable excess of fat Within forty-eight hours after entering the hospital the patient became sugar free on exactly the same diet which he had had except that fat was considerably reduced His blood sugar also became normal and he left the hospital in a short time with considerably increased tolerance This case illustrated the necessity of analyzing food intake

CASE 6.—A woman aged 61 with diabetes was operated on for acute appendicitis Statistics show that there is nothing more dangerous to the life of the diabetic than an acute appendicitis The fear of the dangers caused the physicians to give rather large doses of carbohydrates and of alkali in the hope both of avoiding acidosis and of treating it if it occurred The patient developed a pelvic abscess, and had a considerable glycosuria, but no acidosis, and a very marked gastro intestinal upset When I saw her it was perfectly apparent from her history that her diabetes was mild, the urine showed no acetone bodies and the blood sugar indicated that her body was pretty well saturated with carbohydrate the alveolar air determination was normal, and she was vomiting all the food given her The line of treatment was pretty definitely indicated For a period of twenty-four hours nothing was given by mouth except ice pellets the bowels were emptied by an enema, and then she asked for food The urine still showed some sugar greatly reduced however and there was still no acidosis Then her diet was gradually built up but never high enough to produce glycosuria The patient made a complete recovery and left the hospital to all intents and purposes a normal woman with a fairly liberal diet

If I have made myself clear so far, it should be a comparatively simple matter to plan a set of principles for guidance in the treatment of the individual diabetic It will be evident that the first and perhaps most urgent need of proper therapy is individualization of the patient, individualization based on a combination of the data obtained from the methods of control already outlined The patient with a mild case of diabetes will immediately classify himself as one who on an excessive amount of carbohydrate intake passes sugar without acetone bodies and without marked historical or systemic changes The severe case will likewise fall into its class from actual evidence, such as age at onset, rapid course, loss of weight, perhaps difficulty of being rendered sugar free, and clinical and laboratory signs of acidosis The second principle is to get the patient sugar free without producing or increasing an already existent acidosis In the mild case this is done simply enough by attention to carbohydrates, which, gradually reduced, will almost invariably result in an aglycosuric urine In the severe, or even in the doubtful cases, in the presence of acidosis or threatened acidosis, the cautious physician will leave the carbohydrates alone and devote his attention to the fats It is, indeed, surprising how often elimination of fats in the diet results not only in immediate reduction of acidosis, but also in the diminution or even disappearance of glycosuria It is true that some of the more severe cases, already rendered free from signs of acidosis, require the complete absence of food before sugar disappears Any patient, no matter how severe his case, can and should be made aglycosuric And it is only by recognizing the truth of this that it is possible to fulfil the third requirement in treatment, namely, increase in the patient's food tolerance It is a rule of almost absolute certainty that as a diet is reduced, so is it built up

Only one more matter need be discussed, the control of which is as necessary for successful therapeutics of the diabetic as is anything I have thus far discussed the matter of intelligent cooperation by the

patient or by some member of the patient's family If we wish to make any permanent impress on the diabetic's life, we cannot do it by a two or three weeks' stay in an institution, no matter how scientific our efforts or how brilliant our results The patient must be told what is being done for him, and he must understand what is being told There is no use in talking in the language of the laboratory to a patient who understands only the language of the kitchen We must either teach him the new language or translate our Greek into understandable English

CONCLUSIONS

This bird's eye study of the diabetic problem justifies these conclusions

1 The diabetic, like any other patient, must be considered as an individual

2 The history, physical examination and laboratory data are equally important in establishing a basis for treatment

3 Treatment consists of rendering a patient free from sugar and acetone bodies and increasing his tolerance

4 The patient's cooperation is essential to any permanent results

5 Under such a plan of treatment the lives of some diabetics will be saved, of many will be prolonged, and of most will be freed from distressing complications

104 South Michigan Avenue

RELATION OF ACQUIRED FOOD DISLIKES OF CHILDHOOD TO DISEASES OF MIDDLE LIFE*

C HILTON RICE, JR, M D
MONTGOMERY, ALA

What I am to present is not a hypothesis formulated from a study of case histories, nor is it a set of statistical data gathered to substantiate a preconceived theory It is merely a conclusion that recently unfolded itself in my mind as an illuminating interpretation of general observations of the effect of food on life, first as a general practitioner, who was much baffled by the metabolic disorders of middle life, and later as a pediatrician who observed the tendency of many children to form positive dislikes for certain of the essential foods

The very probable relationship between the food dislikes acquired in childhood and the pathology of middle life, while not capable of immediate scientific demonstration, should, I believe, be borne constantly in mind by both the pediatrician and the internist The general evidence which appears to establish such a relationship is what I desire to present

That which is of great importance in the rational interpretation of the clinical phenomena of nutrition is the background against which such phenomena are viewed Therefore, I shall first sketch the background, then set up the general evidence of observation, and then bring them into focus from a final conclusion

Whatever be the nature of life, for practical scientific purposes the whole of it can be expressed in terms of matter and energy Huxley viewed a living organism as a whirlpool through which there flowed a never-ending stream of matter and energy Certain it is that the flesh of us, created out of the stuff of which our environment is made, is no more than a stabilized system of colloidal matter within which glows the protoplasmic fire of life Visualized against the deep, broad background of biologic chemistry, the human organism becomes revealed as a fearful complexity of interrelated cellular systems, of continuous atomic and molecular activities and energy transformations, of actions, reactions and interactions, between known and unknown catalytic agents, hormones, enzymes, etc

With a speed and orderliness that defy laboratory imitation, the life processes go on so long as the inflow of raw material is unbroken Broadly speaking, to this inflow of raw material, of air, water and food, we give the name nutrition And we pediatricians are nutrition experts, we stand at the headwaters of life, as it were, and observe the quality and quantity of raw material that begins its flow into the new-born We know the effect of food on life We know it better than the internist can ever know it, for we face the simple problem From birth to adolescence we watch the immature human organism mold itself to its food We are not confused by a multiplicity of etiologic factors, as is the internist The baby reflects his diet A balanced diet means a balanced baby, an unbalanced diet, an unbalanced baby

We particularly are familiar with the pathologic condition that comes from the lack of essential food elements And here is a point I wish to stress We know that this pathologic condition is not always the *immediate* effect of a deficient diet Put 100 babies on an exclusive diet of sweetened condensed milk and visualize the result A few will thrive and reach the age of 11 or 12 months before showing signs of malnutrition, others will reach the age of 9 or 10 months in fair health and then show signs of rickets, others will become rachitic as early as the third month, after a few months, one or two may develop scurvy, others will do famously for several months and die suddenly from an acute sugar intoxication, and all along the line from the third month on, a large percentage will sink into a hopeless state of marasmus from persistent vomiting or fermentative diarrhea

These children sicken and perish, not from what they eat, but from the constant lack of essential food elements and the absence of those mysterious "chemical messengers" which are so vitally important in the laboratory of life The effect of these deficiencies is, in most cases, gradual and cumulative, weeks or months elapsing before the infant machine shows serious crippling or a sudden explosion, as in acute sugar intoxication

We know, too, that it is not uncommon to encounter a feeding case that has been malfed to the point at which permanent damage seems to have been done to its chemical machinery, and though the needed food elements are supplied, the capacity for their digestion and assimilation are but partly restored and the child remains a weakling

From observation of the dietary habits of adults and children in general, three facts stand out prominently

1 Almost without exception, the adults and children who possess the red blood and vigor of health are those who eat a variety of foods They may eat

* Read before the Section on Diseases of Children at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

irregularly and consume much of what is commonly called "trash," but their appetites for the essential foods are unimpaired Rarely do I encounter such a healthy adult or child who dislikes milk, eggs, fresh meats or green vegetables The more I have inquired as to the diets of these healthy persons, the more I have noted the almost constant presence of one class of food, the green vegetables Judged from its almost constant seasonal presence in the diets of healthy Southerners, the green vegetable ranks high among the essential foods, probably above milk after the fifth year Certainly, a diet that excludes both green vegetables and milk comes dangerously close to being deficient, if fresh meats are also excluded, I believe that such a diet will lead to serious metabolic disorders if persisted in over long periods of time

2 A great many children, perhaps the majority, appear to be able to while away the between meal hours with ice cream cones and all-day-suckers without impairing their appetites for the essential foods With such children we pediatricians have little to do except to have them pointed out to us as numerous and glaring exceptions to our rigid dietary rules However, we have a great deal to do with the large percentage of children who do not fall into this favored class

In its first year the well fed, rapidly developing baby gets no nourishment except from the breast or bottle His diet is well balanced and he shows all the enviable characteristics of physical and mental equilibrium In the second year he comes into possession of language, of his locomotive mechanism and of the strong desire to taste everything in his immediate environment Then comes the anxious question, What may the baby eat? If parental discipline is strong, all may be well, but if the entire household bows down in idolatrous obedience to every whim of his adventurous palate, the baby comes more and more to satisfy his hunger with those foods that taste best, and so his dietary habits are formed, ranging from mild dislikes for essential foods to alarming perversions

Many times I have seen scrawny, anemic, irritable little children slap aside the life giving foods and cry for candy, pickles, catsup or coffee They possess a craving for these things to the exclusion of all others

Perhaps the commonest type of feeding cases I see is that of children from 4 years up who live almost exclusively on carbohydrates All present varying degrees of the same clinical picture, lassitude, irritableness, secondary anemia and constipation—in short, chronic intestinal indigestion I know in some cases, and have been informed by the parents in others, that the majority of such children were in perfect health in the first and second years of life, with normal appetites and normal digestion But somehow they gradually had turned more and more to the palatable sweets and starches, and developed a mild or positive dislike for milk, eggs, fresh meats or green vegetables

The treatment of these cases is simple enough We need not remove the starches and sweets from their diet Regular feedings and the addition of that which is lacking is all that is necessary to restore health But we know too well the difficulties encountered in a good percentage of such cases, that nothing short of complete and permanent removal from home environment and influences will effect a cure And we know that some of these patients do well for a time, or as long as maternal discipline obtains, and then gradually lapse into their old habits of diet

Most of these carbohydrate children do not suffer any serious impairment of health during childhood Owing to the flexibility and adaptability of youth, they pass into adolescence in fair shape, slightly anemic, perhaps, inclined to be constipated and vaguely conscious of the presence of abdominal viscera that now and again fail to function in their accustomed, automatic harmony

3 A surprising number of sufferers from the diseases of middle life confess to food dislikes that date back to childhood I refer only to those functional and organic disturbances which have no bacterial etiology and which clearly are brought about by some fault in the body metabolism I have questioned many of these "chronics" who haunt the physicians' offices, likewise many adults of unhealthy appearance It is a difficult matter to learn exactly what an adult eats, but comparatively easy to determine his dislikes By getting at their food dislikes I have found that the great majority of those middle aged sufferers I have questioned have lived for years on deficient diets They have always liked the carbohydrates, but eat sparingly or not at all of milk, eggs, fresh meats and green vegetables Many who say they like vegetables refer to potatoes, and those who say they like meat refer only to ham and bacon

CONCLUSION

We are familiar with such pathologic entities as rickets, scurvy, pellagra and beriberi, which result from deficient diets over varying periods of time, but we do not I believe, recognize often enough that the deficient diet is the underlying foundation of more varied and mysterious ills of man than any single causal agent in the whole range of pathology, that of all etiologic factors it is the most difficult to recognize in its masked and remote manifestations, in its gradual, cumulative action on organs and tissues over long periods of time I believe that in the acquired food dislikes of the child, in its early start on an unbalanced diet, in the long continued total or partial absence of essential food elements we see the explanation of many of the metabolic disorders of middle life

I believe it to be highly probable that not a few cases of such middle life affections as hypertension, chronic Bright's disease, visceral ptosis, gastric and duodenal ulcers, etc, are but the remote, graver manifestations of that blighting etiologic factor, the symptoms of which we pediatricians are quick to recognize in their incipiency—the deficient diet Certainly we see quite a few older children who present mild or pronounced symptoms of malnutrition from no other reason than that they have acquired dislikes for essential foods Some of these children cannot be made or trained to eat properly, and pass out of our care If they do not in later life develop serious metabolic disorders, by all the laws of life they ought to

So convinced am I of the ultimate harm that is foreshadowed in the food dislikes of childhood that I have come to view the future welfare of these patients with something of the grave concern with which I look on a valvular heart lesion or a scarlet fever nephritis, for the tendency of such children is to relapse into old habits of diet The carbohydrate diet does not contain the potential elements essential to longevity, nor is the human machine

making its normal life cycle on an unbalanced fuel Just as certain as the child passes into adolescence on a deficient diet and with the first faint blight of malnutrition on him, just that certain will he some day face the internist to learn the rigid conditions under which he may hope to eke out the remnant of a salt-free and joy-free existence

ABSTRACT OF DISCUSSION

DR WILLIAM WALTON BUTTERWORTH, New Orleans Dr Rice presents a new viewpoint concerning some of the disturbances of nutrition While it may be difficult for him to prove his assertions, there is much in his paper to command attention Take rickets, for example While it may not be brought about necessarily by an insufficient amount of food, improper food certainly has something to do with it The results are seen not only early in life, but likewise in later life Then, again, pellagra is believed to be due to certain deficiencies of food, or the active principles which are necessary to proper development Not only is it of slow onset but it may be prolonged in its effect Changes of metabolism may not be very striking at first, but they make such lasting impressions on the organism that permanent results are seen later in life

DR FRITZ B TALBOT, Boston There is no doubt that many of the diseases of adult life find their origin in childhood I have noticed that in a certain group of children there are food dislikes on a good, well balanced diet In my experience, those food dislikes come in certain types of families They come in the type of family in which there is a history of asthma eczema and hay-fever, and sometimes urticaria In those families, of course, we know that we often have idiosyncrasies due to anaphylaxis And we have always to bear in mind, in considering food dislikes, the fact that it may be due to anaphylaxis Do not put a person down as a fool who says that he cannot eat eggs, until you have proved that he is not anaphylactic to eggs

DR MAY G WILSON, New York In 1916 I made a dietetic study in the public schools of New York The results of my study corroborate some of Dr Rice's statements I found that green vegetables other than potatoes, tomatoes and lettuce were absent from the diet In the grades just higher than the kindergarden milk was being left out and tea was being substituted Then still higher condiments were being used The acquired dislike of essential foods is noted as we pass from the kindergarden to the higher grades

DR O M GILBERT, Boulder, Colo It is the almost universal experience when I attempt to outline the diet for my tuberculosis patients to be told that the patient does not like milk or eggs I have become impressed with the fact that this dislike of certain foods must have some bearing on the nutritional factors which predispose to tuberculosis It is true that a few patients have a tendency to an anaphylactic reaction against milk or eggs but with the average person it is only a matter of taking time and using patience and perserverance, to become accustomed to them I have come to disregard almost the likelihood of anaphylaxis, and to insist on the patient gradually adjusting himself to the proper diet Irving Fisher showed the bad effects of excess of protein diet in people past middle life, but to my mind it is well to have the factor of safety, so to speak, on the side of the proteins in the formative period of life And I cannot help but feel that this lack of a proper protein element in our diet is by no means a negligible factor, in the production of this metabolic condition, which predisposes to the development of conditions not only like pellagra, but of tuberculosis

DR C HILTON RICE, JR, Montgomery, Ala The conclusion I presented came to my mind only too recently for me to have kept statistics on it, but I have always had a curiosity as to what people eat, particularly the healthy child and the healthy adult One of the most common diets of children in Alabama, particularly in the rural districts, is bread and syrup The people of the West and North do not see that If it is not bread and syrup, it is too much eating of cakes and candy and ice cream cones between meals, much of the ice cream we get is a mixture of cornstarch and vanilla The eating of sweets between meals destroys the appetite for all food, except sweets and starches These children will eat rice and cereal foods, but they do not like green vegetables They do not like fresh meats Very often they do not like eggs, and in many cases they will not drink milk They have no idiosyncrasies for these foods, because they previously had taken them without harm Mothers and fathers have some fear that the child may have inherited indigestion They say that they never liked green vegetables, that they have not been drinking milk since they were children Some will not even eat butter or anything that comes from the cow I believe that we can look forward and see the effect of food dislikes of childhood, and their relationship to the metabolic diseases of middle life, better than can the internist, who seeks, from fragmentary data, to visualize the past history of his case If he would look back to us, to explain the etiologic factors, we, as pediatricians, could tell him that a certain percentage of children leave us on deficient diet, for no other reason than they never were trained to eat properly—if they don't have trouble, they ought to have it

PLASTIC SURGERY OF THE FACE

TS RECENT DEVELOPMENT AND ITS RELATION TO CIVILIAN PRACTICE *

M F ARBUCKLE, M D
EAST ST LOUIS, ILL

As is well known plastic surgery about the face, especially rhinoplasty,[1] has been practiced for hundreds of years It is my intention in this paper, not to discuss any given operation at length, but to bring to your notice the advancement of this branch of surgery within the last few years, and to suggest that it be more often employed in civilian practice than has been the custom heretofore

The disabilities under consideration may be classified, first, as physical and, second, as mental, the first are actually functional, the disability in the second type of cases is the result of the person's mental attitude toward his disfigurement, and often restricts the activities of an individual sufficiently to reduce his worth to the community to a serious degree We may consider these cases together, we have therefore for consideration such disabilities as are caused by tumors about the face, the removal of which entails much loss of tissue, deformities caused by syphilis, disfiguring scars which usually, by contraction, interfere with proper function of the eyelids, lips, alae nasi, etc, and the loss of eyebrows or part of the nose or ear or of the mucosa and soft parts of the eye-socket, with consequent inability to wear an artificial eye, or of the buccal mucosa, with adhesions and inability to open the mouth properly, or to wear a plate if needed

It was my fortune, while in service, to be detailed to the Queen's Hospital for Facial Injuries at Sidcup, England, where this branch of surgery has been very highly developed and is practiced with, I think, unusual success I have detailed this work with which I am familiar in the British camps, but America is by no means behind in it, as witnessed by the splendid work of Ferris Smith, Blair, Beck, Coughlin, Ingersoll, Arrowsmith, Carter and many others in this country

* Read before the Section on Laryngology Otology and Rhinology at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

1 Keegan D F Rhinoplastic Operations London Balliere Tindall & Cox 1900

This success depends on many factors, prominent among which are abundant material of which the surgeon is in actual control until the work is finished, complete staff and equipment, and close collaboration between the surgical and dental and other departments At Sidcup I learned that it is possible to maneuver skin, fat, muscle, cartilage and bone into new locations at will, with assurance of success in the great majority of instances It is often necessary to do this work in stages Surgical training of the most comprehensive kind is required, also are needed imagination and tenacity of purpose, with ability to draw, pattern and mold, and often much courage to carry out a proposed plan of operation Complete records, such as history, physical examination, photographs and plaster casts, before the operative procedure and before each succeeding operation, and at all times the strictest attention to details, are essential

In supplying tissue to remedy a defect it is of primary importance that a defect be not caused in the region from which the tissue is taken, and that proper environment be afforded the graft while it is becoming established in its new position

In flap grafting, the method of making flaps known as the tubed-pedicle flap [2] overcomes many of the difficulties formerly encountered, such as interference with blood supply and infection, with loss of tissue It also renders it easier to shift flaps without disfigurement In this method two incisions, about 3 inches apart, are made, the intervening skin is dissected up and inverted, the edges are stitched together and allowed to heal, thus forming a tube, the denuded area is covered by approximation beneath the tube, after any necessary undercutting has been done The ends are left undisturbed, the proximal one is located so as to contain the most abundant blood supply available, e g, the superficial temporal artery, and to allow the distal one to reach to its proposed site If branches leading off from the blood supply are blocked, this of course increases the volume of blood passing through the flap After ten to fourteen days the circulation through the tube and flap will have been well established Then the distal end, holding the flap, cut to a pattern made of tinfoil or other suitable material (in exact size and shape of the area to be covered) is dissected up Bleeding should be controlled The flap is now shifted to the desired location

Close coaptation of the entire surface and edges must be had in order to prevent separation by clot and infection and loss of tissue, the edges are best approximated by horsehair stitches placed at close intervals and left from four to eight days As stitches are placed, it is occasionally found necessary either to loosen one or place it in another position, as is indicated by blanching of the skin Surface approximation with this kind of flap usually is good, on account of the fact that the area covered generally is more or less convex

When circulation is well established between the grafted skin and its new lodging place, the pedicle is either utilized to fill in further defect by lifting the former proximal end and turning it around, or else it is severed and returned to its former position

When the tubed-pedicle is utilized as a flap or returned, an incision is made along the line of union of the free edge, and the tube is flattened out In order to prevent contraction of the flap where a covering has been made for a cavity such as the nose, it is necessary that lining be afforded This is done either by reflecting skin edges or by Thiersch grafts Careful massage and local application of heat sometimes is indicated for a few hours after operation Needling also is at times helpful in relieving venous congestion

It is sometimes more advantageous to use a free graft of whole skin, known as the "Wolff graft' Here the graft is cut by pattern to fit, and is sewed carefully into place, covered by tinfoil, and held in apposition for a few hours by a cast of dental molding-compound made immediately beforehand This method frequently is used in covering an area on the forehead where a large flap has been turned down, and closure by approximation alone is not feasible It is also of use in covering small isolated areas in places, such as the tip of the nose

In supplying epithelium to cavities such, for example, as the mouth, the eye socket, eyelids, or the interior of the nose, the Esser [3] operation, modified and much improved by Gillies, Waldron and Pickerell, is the operation of choice The area to be covered is freshened by removal of scar, which usually is present, and by undercutting sufficient to allow the parts to assume the desired position, an exact cast of the raw area is made and allowed to cool in position, it is then covered by Thiersch grafts, the outer surfaces next to the cast, and the cast thus covered is reinserted and held in position from five to eight days Then it can be removed by dividing the stitches which support it, when it will often "pop out," leaving a perfectly lined cavity In order to prevent further contraction of the cavity, it is advisable that a cast of hard rubber be worn for a few weeks This is, of course, to be removed frequently for cleansing, in mouth cases

In some instances it is quite difficult to hold these casts in the desired position about the mouth and nose A well fitting and carefully designed dental appliance cemented to the upper teeth and having an adjustable arm, which is flexible, over which the cast is made, will often overcome this difficulty These must be fully tried out before the operation Free suppuration occurs with these grafts, but they flourish in the presence of pus, and practically always "take"

In replacing eyebrows, care must be taken not to injure the hair follicles They are best taken from the mastoid, and usually show growth in eight to twelve weeks

Frequently it is necessary to replace bone as, for example, in the nose, forehead, cheeks or jaw

Methods of bone-grafting will not be discussed in this paper further than to say that in this type of cases the advance has been great, particularly in jaw injuries The osteoperiosteal graft is of great importance, and probably is available in more instances than any other, particularly when there is great loss of tissue and difficulty in finding anchorage The crest of the ilium is particularly serviceable in ununited fractures of the jaw where there is not great loss of tissue, and where there are good edges to unite with

Cartilage implantation is of great help where loss of bony support has occurred, as in the nose or in the skull, with only soft parts left to cover the dura, or in loss of the malar eminence or margin of the orbit or a part of the auricular cartilage These can be done almost at will

2 Devised by Major H D Gillies R. A M C (J Nat Dental A January 1920)

3 Esser J F Ann Surg 65 297 (March)

Rib cartilage is shaped as desired and inserted either at once or buried in the chest wall, and later on taken out and shaped and put into the desired position

Fat and muscle grafts also are frequently made use of in filling out depressions

The end-results in these cases are so uniformly successful and so very gratifying to both patient and surgeon that I wish to urge the more frequent employment of this line of treatment in these cases

ABSTRACT OF DISCUSSION

DR WILLIAM T COUGHLIN, St Louis When I operate on syphilitics I fear lest things will go wrong, and the accidents are suppuration and sloughing I insist on a course of antisyphilitic treatment before any plastic surgery is attempted on these persons The "mental disability" is worth consideration It is most marked in civilian patients Because there are few in the hospital, they do not see others of like condition I was astonished in war work to see the change in the patients after admission Brought in much depressed, as though it was all over with them, when admitted to the ward with the other patients their attitude changed and they became cheerful Control of a case throughout by one surgeon is important and desirable To attempt to do this without the assistance of our dental colleagues is absurd but the surgeon must direct

The "special" surgeon should have a wide surgical training, and I am glad of the effort being made to have otorhinolaryngology include the head and neck I find it difficult to have patients cooperate They do not want so many operations They want to get through quickly and one cannot get the best results with that kind of work The 'tubed pedicle" is one of the best of flaps Accumulation of blood under the Wolf graft works against its success The Esser inlay is one of the best things the plastic surgeon has gotten out of the war

DR GEORGE M DORRANCE, Philadelphia At the beginning of the war men did not read as they should, if they had they would have known more about transplanting and grafting and would have avoided many mistakes There is practically nothing new in implant surgery In the Crimean War and in the Franco-Prussian War, excellent work was done I do not like the osteoperiosteal graft The best graft of all is the one with a pedicle attached to the subcutaneous or muscular tissues The idea of using cartilage for deformity of the forehead is not correct Fraser used the outer table of the skull and obtained very good results

DR AUSTIN A HAYDEN, Chicago One of the most important steps in the preparation of these patients is to procure very carefully made pictures of the condition present before the operation This can best be done by the man who is going to operate, because photographers invariably try to hide the deformity, which defeats the object of the picture Asepsis is very important Iodin should be used freely inside of the nose and over a considerable area of the face, before an intranasal operation is attempted I have done an intranasal operation It is much harder to get the patient to consent to an operation in which an external incision is to be made

DR FERRIS SMITH, Grand Rapids, Mich I was greatly surprised to hear Dr Dorrance say that there is nothing new about rhinoplasty He has not read much or he would not make that statement The rhinoplasty that was done a thousand years ago was the Indian type of operation, which was performed to cover up the defect, but there was no lining and no support Then they tried a covering with support but no lining, and finally Nelaton combined the three essentials The technic of Gilles, which grew out of his service in the war, certainly is the only method which makes a certain *rhinoplasty possible*

DR MILLARD F ARBUCKLE East St Louis, Ill In selecting the time for operation in cases with suppuration it is important to remember that considerable time is required for the scar tissue to become sterile

THE CATALASE CONTENT OF THE BLOOD IN DIFFERENT TYPES OF ANEMIA*

E B KRUMBHAAR, M D
AND
JOHN H MUSSER, JR, M D
PHILADELPHIA

In spite of the contradictory state of our knowledge of the catalase content of the blood under various clinical and experimental conditions, and the wide variations that have been found in different individuals of the same species,[1] we were led to make a comparative study of the catalase content of normal and anemic bloods by the statement of Van Thienen[2] that in pernicious anemia the catalase index of the blood was extraordinarily high Although Stehle's experiments demonstrate that the catalase content of the blood fluctuates under given conditions parallel with the hemoglobin content, nevertheless an index obtained by dividing the catalase content by the hemoglobin or red blood cell count would still be significant if it constantly showed changes in the same direction in this or that disease We, therefore have endeavored to control Van Thienen's observations by comparing such an index of the blood of pernicious anemia cases with that of other anemias and of nonanemic individuals A further control of the enumeration of the red blood cells in the actual sample from oxalated blood was also made in most cases As the index thus obtained was in the main proportional to that furnished by the clinical erythrocyte count and the variation never sufficient to affect the conclusion drawn, these figures have not been included in this report

The method of estimating the amount of catalase was exactly similar to that described by Stehle The samples of blood were necessarily collected at a distance from the laboratory, so that a delay up to an hour was unavoidable, but control tests proved that standing did not cause an appreciable change in the catalase content The slight increase that was sometimes found after standing several hours we considered to be probably due to the greater concentration of the sample The blood was obtained as far as possible at the same time of day, a given number of drops (twenty) from the ear or vein mixed with two drops of 10 per cent potassium oxalate, and well shaken before samples were taken We could detect no noteworthy differences in venous or capillary blood Two samples were taken of each blood and readings of the amount of oxygen liberated made after five, ten and fifteen minutes Of these readings, which were closely proportional, only the fifteen minute reading has been given, as coming nearest to the correct estimation This we have found to represent about 75 per cent of the total oxygen liberated, and minimizes errors introduced by changes in temperature, acidity, etc In a few cases in which an obvious fault in technic spoiled one of the samples, a single reading was taken In the others as the variation averaged less than 5 per cent, the average of the two readings is given

* From the John Herr Musser Department of Research Medicine, University of Pennsylvania School of Medicine

1 Burge W E and collaborators Am J Physiol **50** 165 (Oct) 1919 and numerous papers in the same journal since 1916 Stehle R L J Biol Chem **39** 403 (Sept) 1919 Winternitz M C Henry G R and McPhedran F The Determination of the Catalytic Activity of the Blood as a Clinical Diagnostic Method Arch Int Med **7** 624 (May) 1911

2 Van Thienen G J Nederlandsch Tijd chr v Geneesk **1** 2006 (June 7) 1919

After most of this work was done there appeared Bodansky's [3] demonstration that the volume of oxygen liberated depends on the hydrogen ion concentration of the peroxid, which may vary up to 35 per cent in different samples of the same make We were fortunate in having used only three different samples of peroxid, all of the same make, and made several estimations on each type of case with the same sample Our conclusions therefore, are not affected by the lack of control of this factor, although we have several times confirmed his observation that more oxygen is liberated from peroxid of p_H 7 than of lower hydrogen ion concentration The catalase index was obtained by dividing the number of cubic centimeters of oxygen liberated at the end of fifteen minutes by the red cell count expressed in millions Records of temperature and barometric pressure were kept, but the correction involved (which was always found to vary by less than 4 per cent) was so small, compared to the individual variations, that the original readings have been retained

RELATION OF CATALASE CONTENT OF BLOOD TO RED BLOOD CELL COUNT

Average	164 1	5 013 000	32 7

Two items are at once apparent in the accompanying table first that the anemic blood liberated much less oxygen than the normal, and second, that the wide variations found by other workers were also present in our series Both the actual amount of oxygen liberated and the resulting indexes varied less in the nonanemic than in the anemic individuals, but the averages obtained from all three groups were surprisingly close

It is stated by Wells [4] that removal of various organs—among which is included the spleen—temporarily diminishes the catalase contents of the blood In a few tests on splenectomized monkeys we have found this to be the case but are inclined to attribute it to the transient anemia that follows splenectomy In a case of hemolytic jaundice on the other hand, when the blood picture improved greatly after splenectomy, the catalase content also increased so that there was very little resultant change in the catalase index In dogs, the catalase content of the blood is relatively low, but after they had been made plethoric by repeated transfusions, it was considerably increased

3 Bodansky M A Note on the Determination of Catalase in Blood J Biol Chem **40** 127 (Nov) 1919
4 Wells H G Chemical Pathology Ed 2 p 69

CONCLUSIONS

Under the conditions observed by us, the catalase content of the blood varies according to the concentration of red blood cells and this ratio is not materially affected by splenectomy or by the various types of anemia studied

GAUCHER'S DISEASE

REPORT OF A CASE

S W SAPPINGTON, M D
PHILADELPHIA

According to Mandlebaum, up to 1916 there were nineteen instances of Gaucher's disease in the literature in which the diagnosis had been determined by histologic examination Since then, cases established on a similar basis have been reported by Evans, Reuben, Mandlebaum (two) and Carr and Moorhead This makes a total of twenty-four authentic cases,[1] to which the present report adds another

REPORT OF CASE

History.—J B aged 50, a Polish Jew a shoemaker, lived alone and had no relations or friends in this country, and very little could be learned of his previous history From the reports of the neighbors though somewhat "queer" he was apparently in good health and attended to his business regularly The day of his death he acted quite eccentrically, and without reason struck at one of his customers and chased her from the shop So violent were his actions that a policeman hurriedly called shot twice at the man each shot taking effect The patient was taken by the police patrol to the Hahnemann Hospital where an examination revealed the two bullet wounds One of these entered about the seventh rib on the right side causing a hematoma, but not penetrating farther the bullet being plainly palpable The other bullet entered in the left iliac region but no exit was found On admission the patient was conscious and able to tell his name and age and answer other questions He rapidly lapsed into unconsciousness however, and died in an hour and a half

Necropsy.—This was performed twenty-five hours after death by the coroner's physician, Dr W S Wadsworth, whose

notes state that the subject was of medium size and the body was in good condition, with fair muscular development and a moderate amount of fat The necropsy was performed primarily to ascertain the fatal effect of the bullets, and hence the notes on the organs are only casual The stomach and intestine were penetrated, and the lower edge of the spleen was cut by the bullet The liver exhibited what looked like a moderate chronic hepatitis The retroperitoneal glands were moderately enlarged The condition of the spleen was so peculiar that Dr Wadsworth kindly offered it to me for further gross and microscopic examination Death was unquestionably to be attributed to the bullet wound

The spleen was brought at once to the laboratory and found to weigh 825 gm and measure 23 by 12 7 by 5 cm The organ in general was quite soft, in some spots almost mushy, but scattered all through it were firm nodules more apparent to the palpating finger than to the eye The feel of these nodules might be compared to that of the numerous secondary tumors felt in malignant growth of the lung On section the firmer areas were not plainly discernible The general color of the sectioned spleen was that of a normal organ but close inspection revealed that the nodules were of a deeper brownish red than the surrounding parts The size of these firmer masses varied from 0 5 to 1 5 cm in diameter

Microscopic examination disclosed the characteristic picture of Gaucher's disease Rather marked thickening of the arteries and an abundance of pigment were also noted The nodular portions of the spleen correspond to those areas in which the dilated sinuses were prominent To eliminate any doubt as to the authenticity of the case sections were submitted to Dr F S Mandlebaum for an opinion His observations are as follows

"The sections of spleen from your case show the typical lesion of Gaucher's disease The dilated sinuses the arrangement of the large cells with the peculiar type of cytoplasm and small nuclei, often multiple, the pigment—all these are most characteristic features It might appear at a glance that those portions of the spleen in which the sinuses are not very prominent were devoid of large cells but with the high power the cells are readily seem among the pulp cells The follicles are rather well preserved but throughout the section the arteries show marked changes I assume from this that your case is that of an adult also because the pigment is quite prominent In young individuals the pigment as a rule is scant or absent in the spleen"

COMMENT

Clinically the meager knowledge of this case permits but few comments In the matter of age, this patient of 50 is the oldest case of Gaucher's on record Carr and Moorhead's [1] patient was 46 and Marchand's [1] the next in order, was 44 years of age As the disease is supposed to begin in infancy or early life and last many years, it might be expected that the older the patient, the greater would be the size of the spleen This was apparently realized in Brill, Mandlebaum and Libman's [1] case, the patient dying at 42, the disease lasting twenty-one years and the spleen weighing 8,100 gm Carr and Moorhead's [1] case also had a duration of thirty-seven years, and the spleen weighed 4,990 gm But Marchand's [1] patient, in whom the disease was supposed to have a duration of twenty years, had a spleen weighing only 2,720 gm And Schlagenhaufer's case had a record of thirty-eight years' duration, the patient dying at 43 with tuberculosis, and the spleen weighing 3,510 gm In the present case, the spleen, as far as can be ascertained, is the smallest of the Gaucher type occurring in adults, indicating that the disease began late in life or was extremely slow in development

The familial aspect of this disease has rightly been emphasized, but in none of the original reports available or in any of the summaries from the literature has there been found mention of racial predilection Yet, correctly or incorrectly, the perusal of case reports has given the collective impression that the disease is more common in Jews In the case herewith cited, the patient was a Jew This comment is therefore intended to be interrogative in character

The histology of Gaucher's disease has been described with great detail and exactness by Marchand,[1] Schlagenhaufer,[1] Risel,[2] Mandlebaum [3] and Mandlebaum and Downey [3] To the usual microscopic studies have lately been added observations on the microchemical reactions for lipoids Anitschkow [4] demonstrated large cells containing lipoids in animals experimentally fed on fats and lipoids, and in these cases the lesions resembled those of Gaucher's disease so closely that Aschoff [5] referred to the condition as "pseudo-Gaucher" Schultze,[6] Lutz [7] and Williams and Dresbach [8] also reported cases of diabetes with lipoidemia featured by large cells containing lipoids The resemblance to Gaucher's disease in these cases was noted In the two cases of Knox, Wahl and Schmeisser,[9] reported as examples of Gaucher's disease, the authors demonstrated a lipoid substance in the large cells of the first case Mandlebaum and Downey,[10] in a criticism of Knox, Wahl and Schmeisser's paper, point out the histologic identity of these cases with those of Anitschkow, Schultze and Lutz, and the further resemblance in lipoid content They conclude that the foregoing cases are not true examples of Gaucher's disease and believe that in genuine Gaucher's disease fat or lipoid bodies cannot be demonstrated in the large cells by microchemical means

In the present case sections of the formaldehyd-fixed spleen were stained with osmic acid, scarlet R, sudan III, Nile blue and by Ciaccio's method With osmic acid Nile blue and Ciaccio's method, results were negative Scarlet R and sudan III were used in the simple alcoholic solution, in Herxheimer's alkaline solution and also in his solution in alcohol and acetone The results with simple alcoholic solutions were negative, and those with the alkaline solutions were negative or unsatisfactory In employing scarlet R and sudan III dissolved in alcohol and acetone, the staining sections were exposed in open dishes contrary to the usual directions, and the fluid allowed to evaporate more or less In this way, it was noted that the large cells in the sinuses, as well as those in the pulp, took on a decided pink or red This color was never the deep red assumed by control fat sections, but in the spleen the color of the large cells contrasted distinctly with the pallor of the follicles and other cellular portions of the section They were easily the deepest stained parts of the specimen This was not due to precipitate for the cells assumed a diffuse pink or red color and not a granular or dotted appearance The significance of this reaction is not clear, but attention is called to Bullard's [11] remarks

Bell [12] believed that neutral fat is readily stained with simple alcoholic solutions of scharlach R but many faintly refractive liposomes which consist wholly or in part of lipoids are stained only by Herxheimer's method Later

Bell" states that there is no good evidence that Herxheimer's stain will show fats which are qualitatively different from those brought out by the simple alcoholic stains He, however, thinks that his faintly refractive liposomes contain some substance other than fat, possibly an albuminolipoid, and are usually left unstained by simple alcoholic solutions of scharlach R, while they may be stained with more or less intensity by Herxheimer's method

The Herxheimer method referred to by Bell is the alkaline alcoholic solution Mandlebaum[14] notes that while the peculiar substance in the cells of Gaucher's disease has never reacted to any microchemical method for lipoids, it is in all probability of complex protein nature in combination with lipoids

SUMMARY

The case of Gaucher's disease herewith reported is the twenty-fifth on record in which the diagnosis has been established by histologic examination The patient was 50 years of age, the oldest recorded Some positive staining reactions were obtained with concentrated Herxheimer's solutions of scarlet R and sudan III The significance of these results, however, is not clear

Clinical Notes, Suggestions, and New Instruments

ANESTHETIC FRAME

MYER N MOSKOVICH M D ST PAUL

The drop method of administering an anesthetic is superior to any other at present in use After the surgical point of anesthesia has been reached, only a small amount of the

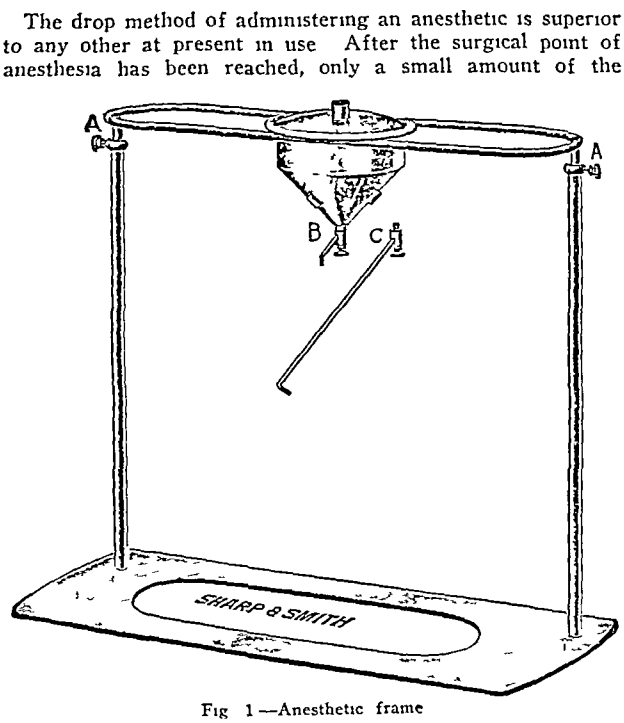

Fig 1—Anesthetic frame

anesthetic is required to keep the patient under and it is equal to that expired by the patient plus that given off by his tissues The variation in different individuals is within the range of difference between a slow and a fast continuous drop of the anesthetic It is difficult, however, to give such an anesthetic without interruption by the essential duties to watch the eyes, properly support the jaws take and record pulse and respirations, and do any number of other things arising during the course of its administration It was the desire to have an even and uninterrupted anesthetic given which prompted me to devise the apparatus here described

Figure 1 represents an anesthetic frame It is 15 inches in height when closed 18 inches in width, and weighs 5½ pounds The screws at *A* permit the height to be increased

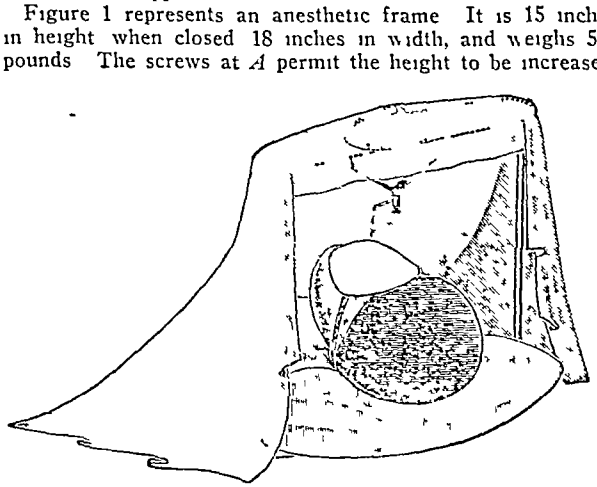

Fig 2—Apparatus in use

The can holds 12 ounces of the anesthetic, and may be rotated about or moved from side to side The short nozzle *B* is used in operations in which a sterile anesthetic is not required while the longer nozzle *C* is substituted in all operations about the head, neck and shoulders, thus administering the anesthetic at a point 8 inches from the patient's head, at which distance the operator works without being handicapped by the presence of the frame The small thumb screw at the lowermost part of each nozzle is used to adjust the flow from a slow to a fast drop or a continuous stream

Figure 2 crudely shows the apparatus in use and the manner in which the sheet from the patient's body is drawn over the frame to act as a means of separation between the operator's field and that of the anesthetist The patient's head rests on a pillow which fits between the rods of the frame and helps to keep the apparatus from sliding when the Trendelenburg position is used

The patient is first anesthetized in the usual manner When the third stage of anesthesia has been reached the frame is placed in position and the thumb screw regulated to permit the desired flow An Esmarch mask is used to receive the anesthetic and the gauze or flannel which envelops it is capable of diffusing the anesthetic as fast as it drops, a point which I proved to my own satisfaction and also to the satisfaction of those who have watched the frame in use

ADVANTAGES

1 The apparatus aids in the administration of a uniform drop method anesthetic without interruption

2 It permits the use of one or both hands when required

3 It acts as a shield in separating the operator from the anesthetist

4 It may be used to replace the so called sterile anesthetic, which in reality does not exist

5 Ether or chloroform may be used

6 The frame is of convenient size simple in construction uncomplicated in its manipulation, attractive in appearance, and inexpensive

Sodium Fluorid as Insecticide—The best insecticide against the roaches is sodium fluorid powder mixed half and half with flour or starch and sprinkled lightly about their haunts If the powder is used pure it is not very efficacious as the roaches will not always eat it particularly if it is heavily sprinkled as its poisonous effect on the insect is produced by its being ingested—*U S Nav M Bull* January 1920

LIMITATIONS OF KNOWLEDGE IN THE MANAGEMENT OF NEPHRITIS

It is a wholesome experience in medicine from time to time to pause long enough to take stock of our knowledge in various departments of practice, and to ascertain whether we are walking in the light of sound information or merely groping aimlessly in the darkness of ignorance Now and then some thoughtful clinician, who is unwilling to apply drugs regarding the action of which he has only traditional or conjectural evidence to guide him, is met with the charge of therapeutic nihilism In this day and generation, however, it is high time to understand that skepticism is not necessarily identical with either ignorance or pessimism Scientific education has taught medical men, like others, to demand the truth above all else Guesswork can never be a real panacea For this reason we welcome the frankly critical review by Christian[1] which was recently published in THE JOURNAL on the subject of treatment in chronic nephritis

The subject is one of such widespread interest and significance in the daily life of every physician that the gaps in our knowledge deserve to be made clear and prominent Without essaying to review the details of Christian's contentions, we may point out in his words that, except for the removal of recognized foci of infection and as prompt and efficient treatment as is possible of all acute infections, we at present can do virtually nothing for the prevention of nephritis Preventive treatment in a practical sense is almost nil for chronic nephritis, and will remain so until we learn more of the etiology and particularly of the factors that influence the progressive development of renal lesions The use of new words, such as nephropathy or nephrosis, does not advance our knowledge beyond addition to the vocabulary

It is currently believed that in chronic nephritis the kidney is more or less incompetent and must therefore be spared from "overwork" Since water, salts and nitrogenous catabolites represent the compounds which the kidneys help to eliminate, effort is often made to diminish the occasion for getting rid of these products The intake of these, or of their precursors in the case of nitrogenous waste products, is restricted Although it is realized that undue reduction in the water output may damage the renal cells owing to the excessive concentration of the resulting urine, few efforts have been made to ascertain what constitutes an optimal or desirable water intake in nephritis Practice today proceeds in individual cases on a basis of hypothesis rather than fact, yet, as Christian has remarked, until appropriate studies have been made, much of the value of a prescribed water intake in influencing the course of nephritis must remain guesswork The "flushing out" of the "system" or the kidneys with water, whatever this may mean, represents the converse unfounded therapeutic project that one still hears spoken of at the bedside

"Sparing" the kidneys by restricting the protein intake likewise is not without possibilities of detriment if it is continued to an extreme degree or over long periods The advantages of reducing kidney function by decreasing the excretory work to be done has been heralded by the advocates of the low protein diet There is, however, no proof that a kidney necessarily suffers by the work to which it is adapted any more than does a muscle Functional performance tends in many instances to improve rather than deteriorate the structures concerned By use a muscle grows stronger, more efficient, and less easily fatigued Inaction is detrimental What is "physiologic rest" for the kidney? And what will be the effect, on the organism as a whole, of prolonged deprivation of indispensable protein? Janney[2] has sounded a possible warning by asserting that nephritics may even attain an unfavorable condition because of low protein intake for a long period Those patients are frequently rather weak and obese because the average man will make up promptly in fats and carbohydrates for what he is prevented from taking in the way of protein food The occurrence of obesity must be avoided in nephritis The obese nephritic is usually weak and neurasthenic

To the foregoing features of uncertainty may be added the limitations of knowledge with respect to nephritic edema and its management It is not always easy to dissociate the renal from the extrarenal factors The once valued diuretic drugs are known to be actually harmful in some cases in that they only add to the kidney irritation without facilitating elimination Debilitating sweats and catharsis help little at best And when we approach the subject of the hypothetic toxins, the vagueness of the literature is a monument to the substitution of fancy for fact We need more facts

2 Janney N W in discussion on article by Christian J A M A 74 1618 (June 12) 1920

VITAL STAINING

The current scientific literature includes numerous references to phenomena that are designated as "vital staining"—an expression which we believe to have been promoted, if not actually introduced by Ehrlich In its original implication it was supposed to apply to certain living cells that were distinguishable from others by the capacity of being stained with special dyes introduced into the body Methylene blue was among the first of such compounds to be studied Numerous other "vital stains" have since been investigated It was Ehrlich's belief that the localization of these dyes in definite structures is due to chemical combinations within the tissues The capacity of a cell to undergo vital staining was thus interpreted as a reaction between special groups in the protoplasm and the selected dye The hypothesis was formulated to fit Ehrlich's "side chain theory," which has played a prominent part in the development of the science of immunology

A review of the history of vital staining shows that the phenomenon has played a part in the explanations of the permeability of cells in general Certain uninjured cells are readily penetrated and "stained" by such dyes as neutral red, methylene blue, toluidin blue, thionin and saffranin Other dyes like nigrosin and anilin blue tested under comparable conditions do not penetrate the cells Wells [1] has pointed out that Overton tested the solubility of dyes which are not vital stains and found them insoluble in oils, fats and fatty acids, but the dyes staining living cells were readily soluble in lecithin, cholesterol, "protagon" and cerebrin, the so-called cell lipoids Furthermore, if crumbs of lecithin, "protagon" or cerebrin were placed in very dilute watery solutions of these dyes, they were found to absorb from the water the vital stains, but not the others, which indicates that stains that penetrate living cells are more soluble in lipoids than they are in water

The theory of the essential lipoid solubility of all dyes that penetrate cells must be abandoned because of numerous contradictions with experimental facts As the result of an elaborate study of vital stains and staining, Schulemann [2] has found it necessary to discard the other previously mentioned hypothesis also According to him, the occurrence or nonoccurrence of vital staining with any dyes depends essentially on the physicochemical properties of the latter Those dyes that are not readily diffusible penetrate cells with slowness, and when once they find their way into these structures they disappear from them only slowly Readily diffusible compounds, on the other hand, easily stain cells, and the dye disappears again with readiness Vital staining thus becomes in the main a question of penetration by diffusion—not a problem of specific chemical affinity with some component of the protoplasm The behavior of dyes in relation to cells is a result of the physicochemical properties of the substance investigated, rather than of their chemical structure The deposition of dyes in granular form within tissues seems to depend on physicochemical conditions that induce flocculation

The distribution and deposition of dyes as they are observed in so-called vital staining is of scientific interest because these phenomena, which can be followed by the colors that are involved, apparently duplicate the movements of many other noncolored substances, including products of metabolism, within the tissues If it is true, as Schulemann asserts, that the vital stainings are the exhibitions of the expected distribution of chemical substances having appropriate diffusion and solubility characters, it may be assumed that nonvisible compounds like the amino-acids, carbohydrates and other normally occurring metabolic intermediary products of comparable diffusibility, etc, can find their way into the same structures by the same pathways from the blood This is likewise true of the movements of drugs in the body Suitable dyes may be expected to teach the paths, places and limits of penetration which may ultimately help to disclose where and how important biologic reactions take place Vital staining has already been employed to distinguish normal from abnormal cells by their unlike permeability to the products selected to discover them Perhaps the appropriate pathways of drugs will similarly be discovered

1 Wells H G Chemical Pathology Philadelphia W B Saunders Company 1918 p 50

INTERRELATIONS OF ATROPHY AND HYPERTROPHY IN THE LIVER

Under abnormal conditions, portions of the liver may be the seat of either atrophy or hypertrophy An increase in the mass of one or more lobes has been observed to follow local disturbances that interfere with the portal supply to other parts of the same organ This increment in hepatic parenchyma may be regarded as a compensatory hypertrophy, analogous to the overgrowth which other parenchymatous structures undergo when added burdens of functioning are thrown on them The possibility of an atrophy in one lobe dependent essentially on a simultaneously developing hypertrophy elsewhere seems, on the other hand not to have been appreciated in the study of the pathology of the liver The prevailing view has been that severe atrophic liver changes do not occur after interference with branches of the portal circulation in man or the laboratory animals unless the blood pressure is abnormally low in the hepatic artery or the vena cava as the result of a disturbed circulation When atrophy does occur, it has been thought to be due to some more severe degeneration of tissue

Rous and Larimore[1] have recently recorded the occurrence of atrophy in liver tissue conditional on compensatory changes in other parts of the organ The occlusion of portal branches to a part of the liver of the rabbit leads to a progressive and ultimately complete atrophy of the parenchyma in the region deprived of portal blood, and to hypertrophy of the rest of the hepatic tissue which receives such blood in excess Three fourths of the liver may thus be reduced to a fibrous tag within two months, while the remaining fourth attains the bulk of the entire original organ The atrophy is simple, unaccompanied by obvious degenerative changes or by any connective tissue replacement More important, it is conditional in nature, failing to progress when the bile duct from the proliferating tissue is ligated and its hypertrophy checked in this way

There are numerous indications, as Rous and Larimore point out, that in man also an atrophy conditional on hypertrophy elsewhere may occur after interference with parts of the portal circulation They suggest that the advanced local atrophy sometimes occurring in livers containing an echinococcus cyst, a gumma, slow growing tumor, or other limited process may well be the result of pressure on portal radicles In such instances there is present elsewhere in the organ an abundance of parenchyma capable of compensatory proliferation Likewise, it is suggested that local portal obstruction may be a prime cause for the extreme atrophy and hypertrophy sometimes seen in syphilitic livers, whereby great hepatic distortion results

How is a destruction of liver tissue dependent on compensatory hypertrophy to be explained? Various possibilities have suggested themselves When the portal blood stream is obstructed, the liver tissue is dependent on arterial blood alone It is conceivable that the latter may be unsuitable for hepatic cells, but such unfitness would apply even when other liver cells were not undergoing hypertrophy on which the atrophy is evidently conditioned Possibly the lack of the particular digestion products carried by the portal stream alters the functional state of the hampered cells Perhaps, indeed, a special "food" is needed for the liver tissue which it cannot secure from the general circulation when once the unimpeded hepatic residue has hypertrophied to the point of being able to utilize all that is brought to it by the remaining portal stream These are, indeed, mere physiologic speculations If a "functional atrophy" of the liver truly exists, however, we must agree with Rous and Larimore that its completeness indicates that the liver has no essential activity, at least none on which its maintenance depends, which is not intimately associated with substances derived from the organs drained by the portal system It is a significant experimental observation that the bile secreted from a liver mass far advanced in atrophy and competing with a large bulk of parenchyma receiving the entire portal stream is almost colorless and devoid of characteristic bile salts Glycogen, on the other hand may be present in the atrophic cells in approximately the same amount and distribution as in the hypertrophic liver tissue of the same animal "Conditional atrophy" may not only explain such chemical anomalies, Rous and Larimore venture to believe that it may perhaps also be responsible for alterations in the shape of the normal liver that have been indefinitely attributed heretofore to pressure from the surrounding organs

1 Rous Peyton and Larimore Louise D Relation of the Portal Blood to Liver Maintenance a Demonstration of Liver Atrophy Conditional on Compensation J Exper Med 31 609 (May) 1920

THE MEASURE OF PHYSICAL FITNESS

If the attainment of what is sometimes termed "athletic condition" is a factor in physical fitness and human efficiency, it becomes important to learn the criteria Relative freedom from fatigue, effective muscular training, good health and similar expressions indicative of preparedness for bodily activity offer at best a vague implication regarding the physiologic basis for competent performance by the individual What is involved in physical fitness? How can it be attained and how is it affected by exercise or training? If these questions can be analyzed in a purely objective way free from the personal or individual bias of the examiner or the subject concerned, a distinct step in advance toward a real physiology of exercise will have been taken

A recent writer[1] has concluded that the chief elements in athletic condition are a strong heart muscle, a highly efficient coronary circulation, and good peripheral vasomotor control He hazards the further guess that there may be even deeper factors, such as a vigorous metabolism involving the ability to generate energy rapidly without undue accumulation of harmful end-products Obviously, the possession of these faculties will enhance the ability to meet new muscular tasks with success and to adjust promptly to severe muscular effort There have been numerous suggestions in the past for estimating these features of fitness For example, it has been noted that the heart rate serves as an indication of condition, since it is relatively low in the active, well trained person, and that it is increased less on exertion in the athletic person and returns more promptly to its normal rate than it does in the case of the sedentary, inactive individual A slow horizontal and a slow vertical postural pulse, with a small difference between the two, are also usually now regarded as signs of "excellent health" Changes in blood pressure have also been referred to as indicative of the same features[2]

1 Manual of Medical Research Laboratory War Department Air Service Division of Military Aeronautics Washington D C 1918 p 85

2 Crampton Proc Soc Exper Biol & Med 12 119 1915 Sewall Am J M Sc 158 786 1919

The question of physical condition has been especially important in the disposal of men in the service of the army Reviewing the difficulties that beset the responsible officer, Schneider[3] has lately pointed out in THE JOURNAL that so far as the pulse rate criteria are concerned, in forming a judgment as to the physical condition of a man it is best to consider together the postural rate, the increase on standing and after exercise, and the time required for the rate to return to the normal after exercise Those who are concerned in physical training as an aid to healthful living will be interested in Schneider's account of the scoring scheme introduced in the medical inspection of the air service to take cognizance of six factors that represent cardiovascular changes or conditions In a mathematical way it recognizes, with a minimum of "personal bias," to quote Schneider, that fatigue or derangement may be evidenced in the high heart rate during reclining, during standing, in the number of beats the heart rate increases when the standing and reclining postures are compared, in the accleration of the pulse rate after exercise in the time taken by the pulse to return to normal, and, lastly, in the rise or fall in the systolic blood pressure on standing A low score not only helps to eliminate the less fit but also acts as a stimulus to the person who needs to exercise in such a way that "his heart will have to work harder, the coronary vessels deliver a full volume of blood, the vasomotors be practiced in their work, the respiration deepened, and metabolism kept going at an increased rate"[1] Apparently we now have a more satisfactory test of cardiovascular fitness

GENERAL WILLIAM CRAWFORD GORGAS

A man sometimes becomes a tradition or a symbol Before his death, Gen William Crawford Gorgas had become a symbol of hygiene an idol to whom all the nations of the world appealed when threatened by deadly plague or perilous infection The tradition, in this case, was based on a record of successful accomplishments yellow fever driven from Havana, Panama —the "White Man's Grave"—made one of the most healthful places in the world, investigations on pneumonia in Africa, and an American army under his protection, with one of the lowest mortality records heretofore achieved It is not necessary to repeat here how these sanitary triumphs were developed Much has been written on the subject, and no doubt the future will produce competent histories and appreciations, but it is interesting to consider the record in relation to Gorgas, the man His personality was not that of the indomitable leader whose word is law and who brooks no interference He was a man of soft word and kind thought, seeking counsel and gathering around himself associates whom he trusted and who put their trust in him He made many friends through his ever gracious manner He greeted all with a smile of welcome, ever ready to hear both sides of any case which might come before him in the many positions of leadership which he held He commanded the love and respect of all with whom he came in contact It was this that made it possible for Dr Gorgas to accomplish the great works that have made his name a household word in every civilized land "In the conquest of science over disease" said Welch, on one of the many occasions in which the medical profession honored General Gorgas, "in the saving of untold thousands of human lives and human treasure, in the protection of our shores from the once ever-threatening scourge of yellow fever, in the reclamation to civilization of tropical lands—in results such as these are to be found the monuments of our laureate, his victories of peace"

BEHAVIOR OF UNCOOKED STARCH IN THE DIGESTIVE TRACT

When uncooked starch is subjected to the action of human saliva in the biochemical laboratory, it is converted slowly and incompletely at best into soluble products The student has been taught that the starch grains must be ruptured and their contents "liberated" to insure good amylolytic digestion The membranes enveloping the starch grains have been regarded as relatively impervious to digestive juices and the enzymes which they contain, hence the importance of cooking starch to render it readily digestible It has been reported, in harmony with this point of view, that no starch appears in the feces after a meal of well cooked wheat or rye bread, rice or potatoes, or even legumes prepared in the form of puree Legumes not in this form—for example, string beans eaten as salad—may resist the action of the digestive juices so that the starch contents of the cell are untouched, and the vegetable cells appear in the feces These facts explain the appearance of bread in the feces if the bread is badly baked, or if such a "heavy" bread as pumpernickel is eaten The imperfectly heated bread contains starch granules whose coverings are impermeable to the digestive juices, as are also many of those in the unbolted rye of pumpernickel[1] Despite these traditional teachings, it appears from recent investigations conducted in the Office of Home Economics of the U S Department of Agriculture[2] that current statements categorically claiming that starch in the "raw" state is to man an almost indigestible substance must be revised The proof of the pudding is the eating Langworthy and Deuel[2] have fed to men fairly large quantities of raw starches in the form of frozen puddings resembling ice cream in taste and texture The starch granules were neither swollen nor broken, yet ingested quantities exceeding 200 gm a day disappeared from the gastro-intestinal tract Raw corn and wheat starches were found to be

2 Langworthy C F and Deuel H J Digestibility of Raw Corn Potato and Wheat Starche J Biol Chem 42 27 (May) 1920

completely assimilated, and no trace of them could be found in the feces. Experiments on raw potato starch gave values for its digestibility varying from 62.3 to 95.2 per cent., the average was 78 per cent. The digestibility of the other constituents of the diet was not affected to any great extent by the large amounts of raw starch ingested. Why the ingestion of potato starch caused disagreeable physiologic disturbances not noted in the other experiments with raw corn and wheat starches remains to be ascertained. Whatever the explanation of this undoubted capacity for the utilization of at least some uncooked starches in the digestive tract of man may be, the newly demonstrated facts place the potency of the alimentary apparatus of man in a new and favorable light.

Fiske Prize Awarded—Announcement was made by the president of the Fiske fund that the prize of $200 offered for the best essay on the subject Surgical Lessons from the Great War' has been awarded to Dr Allen G Rice, Springfield, Mass Under the terms of the Fiske Fund a prize of $200 annually is awarded for the best essay on a subject selected by the trustees The subject for next year is Compulsory Health Insurance" The contest is open to all physicians and details regarding it may be obtained by addressing Dr Halsey DeWolf Providence, secretary of the fund

SOUTH CAROLINA

Medical College Building Sold—The state sinking fund commission has sold the old South Carolina College building, Charleston, to Montague Triest for $12,000

Clinic Day—Clinic day was celebrated in Columbia, June 8, when more than 150 surgeons from all over the state were the guests of the Columbia Medical Society The day was devoted to clinics, and in the evening a banquet was given with addresses

Venereal Disease Clinics—A free clinic for the treatment of venereal disease is to be established in Union Local support to the extent of $4,000 has been secured, and the state board of health has agreed to furnish $2 000 This will be sufficient to carry on the work for one year

Personal—Dr Elizabeth S Van Duyne resident physician and professor of physiology and hygiene at Converse College, Spartanburg, has resigned to accept a similar position at Goucher College, Baltimore——Mrs Frances M Montgomery formerly superintendent of the Chick Springs Sanatorium and Steedly Clinic at Chick Springs will be connected with the University Sanatorium, which is just being completed at Anderson

Commencement—The annual commencement exercises of the Medical College of South Carolina were held at Charleston June 3, when degrees were conferred on a class of fourteen These faculty changes were announced Dr J P Richardson has been appointed instructor in clinical pathology, Dr J J LaRoche instructor in medicine, Dr M W Beach, instructor in pediatrics Dr H P Jenkins Jr assistant in obstetrics and medicine, Dr H S Mustard, instructor in pediatrics The college cup Dr William Rhett assistant in medicine and the Blease medal awarded the honor graduate in medicine and the Blease medal were won by Dr Harry E Levit

WISCONSIN

Fire in Sanatorium.—Damage to the extent of more than $2 000 was done by fire to the Mount Washington Tuberculosis Sanatorium Eau Claire June 19 The patients were removed without casualty

New District Officers—At the annual meeting of the Ninth Councilor District Medical Society, held in Stevens Point, May 14, Dr Victor A Mason Marshfield was elected president and Dr Joseph F Smith, Wausau, was reelected secretary-treasurer

Plaster Specialist Sentenced—The supreme court of the state has sustained the decision of the lower court which sentenced Dr" Till, the so-called 'plaster specialist' of Barron County to the county jail for six months The decision was on the ground that the defendant had had a fair trial and was properly convicted

New Clinic for Ashland—The new clinic building in Ashland recently built by Dr John M Dodd is two stories and basement in height and will contain ten complete sets of offices Dr John M Dodd has been elected president of the clinic, Dr Adellon P Andrus vice president, Dr Clyde J Smiles, secretary, and Miss E Peterson treasurer

Bedside Clinics for Physicians—A series of clinics in internal medicine with ward rounds extending over two weeks is offered for physicians at the Milwaukee County Hospital Wauwatosa, by Dr Louis M Warfield The classes are limited to six physicians Courses begin July 12, July 26 August 9 and August 23 No fee is charged Applications should be made to the superintendent, Milwaukee County Hospital, Wauwatosa Wis

Staffs Selected—The directors of the Madison General Hospital on May 19 selected a temporary staff The surgical staff will consist of Dr Thomas W Tormey, chief of staff and Drs Frederick A Davis Corydon G Dwight Louis R Head, Reginald H Jackson Walter H Sheldon and Arthur G Sullivan The medical staff will consist of Drs Hugh P Greeley Cornelius A Harper Harry M Kay, William T Lindsay, Julius C Sommers and Robert Van Valzah

Will Give Complete Medical Course—Legislation recently enacted in Wisconsin provides for the offering of a complete four-year medical course by the University of Wisconsin Medical School It is reported that the teaching of the third year will be offered in the fall of 1923 and that of the fourth year in the fall of 1924 The legislation provides also for the establishing of a state hospital at Madison A university infirmary and the Bradley Memorial Hospital have already been established on the university campus

CANADA

Professional Fees in Montreal—The Montreal Medico-Chirurgical Society has ruled that physicians hereafter shall make charges for telephone advice and prescriptions There will also be an advance in day and night fees in the near future

Center for Vital Statistics—Ottawa is now headquarters for vital statistics for Canada There will be tabulated returns from the dominion Formerly, this was done by each province All provinces will take advantage of the new method

Mental Defectives in Toronto Schools—Three hundred and twenty-five pupils have been found in eleven schools of Toronto with an intelligence quotient of less than 80 per cent Out of 122 defectives below 70 per cent, 100 are possessed of characteristic stigmas of degeneration Dr Charles K Clarke, who made the investigations recommends that the board of education segregate low grade defective children in two or more special classes, centrally located

GENERAL

Eye and Ear Men to Meet—The fifteenth semiannual meeting of the Sioux Valley Eye and Ear Academy will be held at the Hotel Fontenelle Omaha, July 14 under the presidency of Dr James E Reeder, Sioux City, Iowa

Railway Surgeons Elect Officers—At the annual meeting of the Central of Georgia Railway Surgeons' Association held in Savannah, June 3 and 4, the following officers were elected president, Dr George W Williamson, Hartford, Ala, vice presidents, Drs Benjamin L Bridges, Ellaville, Ga, and R Earl Evans, Gordon Ga, and secretary-treasurer, Dr Craig Barrow, Savannah, Ga

Specialists Hold Annual Meeting—At the annual meeting of the American Laryngological Rhinological and Otological Society held in Boston, June 2-4 the following officers were elected president Dr Lee Wallace Dean Iowa City, vice presidents Drs Harmon Smith, New York, Joseph C Beck Chicago, Joseph B Greene, Asheville, N C William V Mullin, Colorado Springs Colo, and Hill Hastings, Los Angeles, secretary, William H Haskin, New York, and treasurer, Dr Ewing W Day, Pittsburgh

Bequests and Donations—The following bequests and donations have recently been announced

Woman's and Mount Sinai hospitals New York and Middlesex N J Hospital each $5 000 by the will of Henry J Duveen New York

Vermilion County Hospital Clinton Ind a donation of $10 000 to supplement $100 000 voted by the county by Mr H M Ferguson Clinton president of the county board

Cornell University $500 000 for the endowment of research professorships and to provide facilities for scientific work a donation by August Heckscher of New York

Grant Hospital Chicago $5 000 by the will of Harry Rubens

American Hospital Neuilly donations of 250 000 francs by George Edward Kessler St Louis and 100 000 francs by Louis D Beaumont of the Aero Club of America

Gifts to Universities and Colleges—The following appropriations have been made to medical schools in the United States by the trustees of the General Education Board

Washington University Medical School St Louis for endowment $1 250,000 for additional laboratory facilities and equipment $70 000

Yale University Medical School New Haven Conn toward a total of $3 000 000 for endowment $1 000 000

Harvard Medical School Boston for improved facilities in obstetrics $300 000 for development of teaching in psychiatry $350 000

Johns Hopkins Medical School Baltimore for development of a new department of pathology (toward a total of $600 000) $40 000

The trustees of the Rockefeller Foundation have also voted the following appropriations

Dalhousie University Medical School Halifax for buildings and equipment $400 000 and for endowment $100 000

Medical Research Foundation of Elizabeth Queen of the Belgians Brussels for general purposes of medical research 1 000 000 francs

College Not Recognized—At its meeting, held June 18 at Atlanta, the National Eclectic Medical Association adopted the following resolution

WHEREAS The Regular State Medical Board of Arkansas has recently sent a resolution to every examining board in the United States calling attention to the fact that the Arkansas Eclectic Medical Board of Examiners persists in examining and licensing graduates of a nondescript medical college of Kansas City Mo primarily it may be to embarrass that college but secondarily it may be an attempt to reflect on Eclectics in general and this national body in particular

Resolved That the secretary of this Arkansas regular board be notified that the aforesaid institution is *not* recognized as an eclectic college by this body

This college is reported as not recognized in Missouri its home state, nor is it probable that it would be recognized by the regular medical boards in the adjoining states It has been reported that the college called itself eclectic in order that its graduates might appear before the Arkansas Eclectic Board of Medical Examiners and by that makeshift secure licenses

LATIN AMERICA

Plague in Mexico—One more death from bubonic plague and one new case were reported at Vera Cruz on July 4

Reorganization of the School of Medicine of Bolivia—The government of Bolivia has recently reorganized the School of Medicine of La Paz and provided funds for the school laboratories

Sanitary Information Office Organized in Chile—There has been recently organized in the department of public health of Chile a branch of the International Sanitary Commission of American Republics

Chilean Medical Delegates—A recent law adopted in Chile provides for the appointment of a medical commission which will come to the United States to study the methods followed in the antivenereal campaign

Biologic Products of Bolivia—The Instituto Nacional de Bacteriologia of Bolivia provides free to citizens of that country the following products antityphoid vaccine antianthrax serum antistaphylococcic vaccine antipneumococcic vaccine diphtheria antitoxin and tuberculin During the second part of the year 1919 75 000 ampules were distributed

Yellow Fever in Salvador—An epidemic of yellow fever was reported June 24 in the northwestern part of Salvador near the Guatemalan frontier The advices state that forty-nine cases have been discovered and that seventeen of these patients have died——Yellow fever was reported June 21, at Sonsonate in the southwestern part of Salvador

Vaccination at El Salvador—During the year 1919, 143 579 persons were either vaccinated or revaccinated at El Salvador The virus was furnished by the vaccine institute of that country——During the years 1916-1919 the uncinariasis department of El Salvador examined 84 136 persons 41 915 of whom were found infected and 12 118 of whom were cured

Cuban Delegate in the United States—Dr Fernando de Plazaola chief of the division of quarantine of the department of sanitation of Cuba has been studying in New Orleans the methods employed to control their previous plague outbreak——The department of sanitation of Cuba has designated Miss Martina Guevara chief of the public health nurses, to study nursing methods in the United States

FOREIGN

Plague in Java—The *Nederlandsch Tijdschrift* states that there were 798 cases of plague reported in Java during the month of April, with 797 deaths In March there were 936 fatal cases

Hospital Fund—The American Hospital at Neuilly, France has thus far received 2 750 000 francs toward the fund of 7 000 000 francs which is being collected for the purpose of enlarging the institution

Births Exceed Deaths in Spain—During 1919 according to vital statistics published by the *Official Gazette* there were 585 352 births in Spain and 482 030 deaths The birth rate was 28.25 per thousand and the death rate, 23 26

Monument to Dr Reymond—A monument was recently erected at Montbrison France in memory of the men from the region who lost their lives in the war and in particular of Dr E Reymond senator from the Loire district and military aviator

Bubonic Plague—June 26 bubonic plague was reported from Catania Sicily by the American consul there Several cases have occurred with two deaths——Assistant Surgeon Carl Michel U S P H S is in charge of the work against bubonic plague at Vera Cruz

Prize to Pende—Dr Nicola Pende professor of pathology at University of Palermo was recently awarded the Pallin-Valier prize by the Venice Reale Istituto for his works on the organs of internal secretion This prize is conferred for the best medical works published in the preceding period

Flechsig's Fiftieth Professional Anniversary—The first volume of Prof P E Flechsig's 'Anatomy of the Human Brain and Spinal Cord on a Myelogenetic Basis appeared May 23 the date of his fiftieth professional anniversary He has been professor of psychiatry at Leipzig since 1877 and chief of the clinic for nervous and mental disease

Postgraduate Work in London.—Physicians seeking graduate medical work in London may obtain [illegible] regard to the opportunities in that

Postgraduate Medical Association, 1 Wimpole Street, London, W 1, England Better information will be secured if, in writing, the particular kind of work desired is mentioned

Tokens of the Gratitude of France—Several American names are in the list recently published of those to whom the French government has awarded the Medaille de la reconnaissance française Among them are Drs Wyatt and Baribault, and the women physicians Drs Finley, Chills, Klotz, Doherty and Fraser, nearly all connected with the hospital at Luzancy

Monument to Living Pediatrician—Our Spanish exchanges give an account of the statue of Dr Gomez Ferrer recently unveiled at Valencia The resolution to erect the monument was adopted at the Asamblea Medica Regional held at Valencia in 1918, as a testimony of the gratitude of the mothers of Valencia to the incumbent of the chair of children's diseases at the University of Valencia, and leader in plans for welfare work for children

Medical Students and Chemical Experiments—The *Deutsche medizinische Wochenschrift* relates that in an explosion in the chemical laboratory at Munster seven students were killed, including two medical students The editor comments that this sustains his appeal for separate lectures for the medical students 'Why ' he asks should medical students have anything to do with experiments with explosives as was the case in this lamentable occurrence?"

Exhibition for Dental Hygiene—A traveling museum to educate the public in the care of the teeth has been organized in the Netherlands, and was on exhibition at Rotterdam for ten days It was organized by the national dental association with the aid of the Green Cross Society The aim of the display is said to be to educate not only the public in the care of the teeth and the dangers of neglect, but to inform the authorities as well so that they will appreciate the necessity for concerted efforts to save the teeth of the rising generation Examination of 20 000 schoolchildren in one Holland city showed carious teeth in 80 per cent Women volunteers explain the exhibits to visitors

The Crisis in Contract Practice in Germany—The *Munchener medizinische Wochenschrift* of May 28 relates that at noon May 25 all the contracts with the sickness insurance companies having expired, physicians all over the country were released from all contract obligations and the Leipziger Verband the solid front of the organized profession has ordered that from that hour the krankenkassen insured are to be treated by the physicians as private patients with cash payment at once for each service rendered The fee to be asked is 8 marks for each office call and 12 marks for each visit, with specified higher rate for extra services No certificates for the patients are to be made out but prescriptions are to be written on the physician's own blanks and marked 'No renewal" The *Wochenschrift* adds, These orders of the Leipziger Verband are to be unconditionally obeyed On the strict and invariable compliance with them depends the outcome of the conflict into which the profession in Germany has now entered Let no one think of his private advantage! The welfare of the whole is in the last line also what is best for the individual ' As THE JOURNAL has already mentioned, at the recent conference between the representatives of the organized profession and of the krankenkassen when the former stated the tentative terms on which the contracts would be renewed, the representatives of the krankenkassen got up and left the room The last mail brings word that a partial agreement has finally been reached between the parties, which is regarded as essential progress toward the desired 'free choice of physicians ' The krankenkassen have also agreed to found institutions to promote social hygiene The question of remuneration is still unsettled and had to be left to a third impartial committee

Deaths in Other Countries

Dr **Demons**, formerly professor of surgery at the University of Bordeaux——Dr **T Barrois**, professor of parasitology at the University of Lille——Dr **R Kretz**, privat-docent of pathologic anatomy at the University of Vienna and author of seventy-five articles on this and allied subjects——Dr **T Debaisieux**, former professor of surgery at the University of Louvain at one time president of the Belgian Academy of Medicine and of the Belgian Surgical Association, aged 73 His son succeeded him in the chair of surgery——Dr **K Franz**, chairman for ten years of the quackery committee of the German Aerztevereinsbund——Dr **F Schatz**, former professor of gynecology and obstetrics at the University of Rostock aged 78

Government Services

General Hospitals Named in Memory of Distinguished Medical Officers

The War Department has inaugurated the policy of naming its general hospitals in memory of deceased medical officers of the Army who have made distinguished records in the service For many years it has been the policy to identify Army hospitals by numbers and particular location of the Army camps or forts

This new policy is one which will appeal to the sentiment and traditions of the Medical Corps of the Army and will identify the medical profession more conspicuously in military affairs than heretofore

In accordance with this new policy the War Department has issued General Order No 40 which provides as follows

General Hospital No 41, Staten Island, N Y, is announced and will be known as the 'Hoff General Hospital, Staten Island, N Y," in honor of Col John Van Rensselaer Hoff, M C, U S Army (born 1848, died 1920), who throughout his entire military career devoted unremitting effort to the efficient organization and administration of the medical department and was the pioneer in the organization and development of the enlisted branch thereof, formerly known as the Hospital Corps

General Hospital No 28, Fort Sheridan, Ill, is announced and will be known as the 'Lovell General Hospital, Fort Sheridan, Ill," in honor of Surg-Gen Joseph Lovell, U S Army (born 1788 died 1836), who served as Surgeon-General of the Army from 1818 to 1836 (The first formal organization of a Medical Department for the Army was prescribed by Congress in 1818 and by virtue of that Act he was appointed Surgeon-General from Hospital Surgeon, being the first officer to bear that title)

General Hospital No 6, Fort McPherson, Ga, is announced and will be known as the 'Lawson General Hospital, Atlanta, Ga ' in honor of Surg-Gen Thomas Lawson, U S Army (born 1795, died 1861), who served as Surgeon-General of the Army from 1836 to 1861 (Awarded brevet rank of brigadier-general in 1848 for meritorious conduct in the Mexican War)

General Hospital No 19, at Oteen N C, is announced and will be known as the "O Reilly General Hospital, Oteen, N C,' in honor of Brig-Gen Robert Maitland O'Reilly, U S Army (born 1845, died 1912), who served as Surgeon-General of the Army from 1902 to 1909 and under whose administration the Medical Reserve Corps of the Army was established

General Hospital No 21, at Denver, is announced and will be known as the 'Fitzsimons General Hospital, Denver," in honor of First Lieut William Thomas Fitzsimons, Medical Officers' Reserve Corps, U S Army (born 1889, died 1917), a skilled surgeon and the first officer of the U S Army killed in the World War He met his death at Dannes-Camiers, France, Sept 4, 1917, in an air raid by the enemy while serving with Base Hospital No 5, U S Army The name also fittingly commemorates the eminent services rendered by the civil medical profession of America as members of the Medical Corps of the Army during the World War

The new hospital to be constructed on the military reservation at El Paso, Texas for which funds have already been appropriated, is announced and will be known as the 'William Beaumont General Hospital, El Paso, Texas," in honor of Major William Beaumont, Surgeon, U S Army (born 1785 died 1853) who during his service as a medical officer of the Army conducted epoch-making investigations of the physiology of digestion, and as a result of his researches became the leading physiologist of the country and the first to make an important and enduring contribution to that science

The Department Hospital, Honolulu, Hawaii, is announced and will be known as the Tripler General Hospital, Honolulu, Hawaii,' in honor of Major Charles Stewart Tripler, Surgeon, U S Army (born 1806, died 1866) who served as a Medical Director of the Army of the Potomac during the Civil War, and as a distinguished author published in 1858 his celebrated manual on the examination of recruits (Awarded brevet rank of Brigadier-General in 1865 for faithful and meritorious service during the Civil War)

The Department Hospital Manila, P I, is announced and will be known as the 'Sternberg General Hospital, Manila, P I," in honor of Brig-Gen George Miller Sternberg, U S

Army (born 1838, died 1915), eminent bacteriologist and sanitarian, who served as Surgeon-General of the Army from 1893 to 1902, and founded the Army Medical School (Awarded brevet ranks of captain and major in 1865 for faithful and meritorious service during the Civil War)

The Walter Reed General Hospital, Washington, D C, will retain its present name

The Army and Navy General Hospital, Hot Springs, Ark, will retain its present name

The Letterman General Hospital, Presidio of San Francisco Calif, will retain its present name

Plague and Smallpox

The department of public health is still much concerned about the eradication of plague from the port of Vera Cruz Some sporadic cases are still occurring From April 19, when the first case was observed to June 18, there were reported thirty-nine cases with twenty-three deaths, which is a high mortality rate The campaign is being carried on with all energy, employing all the available scientific resources There is already at hand a large supply of imported antiplague serum, and prophylactic vaccinations have been made on a large scale, utilizing vaccine received from the United States and also that prepared at the Instituto Bacteriologico Nacional No time has been lost in carrying out deratization measures as well as the isolation of plague patients and suspected cases Occasionally, the authorities have had to contend with the ignorance of some families who refuse to allow their members to be sent to the pesthouse, and even with the criminal connivance of a German physician who concealed a patient and was therefore arrested Railroad communication has been reestablished from Mexico City to Vera Cruz although quarantine of passengers is enforced and merchandise disinfected Mention was made of a case of plague at Tampico, but after investigation it was found that the supposed patient had died of adenophlegmon of the axilla, following an infected wound of the hand

Many cases of smallpox have been reported in the state of Oaxaca

A New Department Planned

The Department of Public Instruction and Fine Arts, which was established in the last years of General Diaz s government, was suppressed during Señor Carranza s term of office Since 1917, the only national center of culture has therefore been the National University Its new rector, Lic Vasconcelos, has explained his intention of asking the government to reestablish the department In his opinion the department of public instruction must be a federal institution This plan, if carried out, will among other things result in correcting or abolishing several of the state medical schools, which are very far from being ideal

Child Welfare Congress Postponed

It was the intention to hold in this city the Congreso Mexicano del Niño in September As in that month there will be held the postponed presidential elections the board of directors of the congress has decided to postpone it until January, 1921 This is all the wiser, since Ing Palavicini, the president of the organizing board, has left for Europe as extraordinary ambassador of the Mexican government to Belgium, France, England, Italy and Spain

BELGIUM

(From Our Regular Correspondent)

May 30 1920

Death of Bersaques

By the death of Dr Charles de Bersaques, one of the most active members of the Societe de medecine de Gand Flanders loses one of its most eminent surgeons Dr Bersaques was a very capable operator and had attained an enviable position at the Hopital de la Biloque He wrote several important works especially on congenital club-foot and surgery of the large intestine

The Effects of War on Children

M Dubois presented before the Academie royale de Belgique certain data regarding the weight and height of Liege children between the ages of 6 and 17 years, in 1918 These data are based on observations of children who presented themselves at the canteens for debilitated children, and they include curves of the weight and height of boys and girls arranged in groups according to their state of health

It appears from these findings that the classical figures of Quetelet are too low to apply to the present average population of our towns that the children who escaped impairment of health up to 1918 were affected during that year and that at that period of the war the debilitated children were much below the average weight and height of normal children although they did not present any determinable symptoms of disease

At a subsequent meeting of the Academie M Duthoit reported the physical condition and development of children in 1915-1919 He was attached to the schools patronized by Her Majesty the Queen and paid careful attention to the development of 600 children between the ages of 2 and 6 who were in care of these institutions He showed the importance of a careful medical inspection of schoolchildren, and pointed out that tuberculosis was not highly prevalent among these children, but that rickets was found in 25 per cent of the young children while the older children were, in general quite robust M Duthoit called attention to the fact that in the Yser region infants are generally healthy and sound from birth and that the high mortality in the first year must be attributed to the almost total abandonment of breast feeding and the absolute ignorance of the mothers It is his hope that the infant clinics which were established during the war will be continued and extended, as they are destined to bring excellent results

Anglo-Belgian Congress of Hygiene

An Anglo-Belgian congress of hygiene in which representatives of other allied nations also participated was held at Brussels May 20 25 The purpose of the congress was not to discuss abstract problems and to broach complex scientific questions but to study the best means for protecting children, for improving the housing conditions for combating tuberculosis and venereal diseases and for promoting industrial, municipal, military and tropical hygiene England has made great progress in these fields, and the creation of a ministry of health promises to render this progress more rapid and more certain

As Belgium faces the same contingencies an exchange of ideas between British and Belgian hygienists and a comparison of practical solutions would seem to be both interesting and highly advantageous

The congress organized by the Royal Institute of Public Health of England with Dr Rene Sand as Belgian secretary had a success beyond all expectations 800 members were registered from England and 200 from Belgium More than 300 papers were presented at the congress, which

divided into the following sections social hygiene, military, naval and tropical hygiene, municipal hygiene, industrial hygiene, hygiene of employed women (maternity protection and infant welfare), and bacteriology and chemistry The main topics were the prevention of venereal diseases, regulations for the reconstruction of towns, and especially the lessons of the war from the point of view of military hygiene Particular attention was given to the question of lighting as related to the hygiene of the industrial worker

School Community Centers and Hygiene

Schoolbuildings are intended primarily for educational purposes but by virtue of a law which permits of their use by certain qualified persons specified in the text, they have latterly been appropriated to public purposes There has been a tendency to make the school more and more a place for public gatherings and a refuge for services of every nature foreign to school purposes As a result, the class rooms are often occupied from 8 a m to 10 p m, and the continuous occupation of the premises prevents thorough disinfection and cleansing, while the presence of a large number of people constitutes in some measure an agency in the propagation of infectious diseases and a permanent danger to the health of the schoolchildren The Conseil d hygiene of the department of the Seine recently resolved to take all possible measures to restore the schools to their legitimatet functions and to restrict their use for purposes other than teaching

French Literature in the United States

The Comite 'France Amerique' has recently designated a subcommittee of ten prominent men of France, including Dr Henri Roger, *dean of the Paris faculty of medicine* with directions that they prepare a monthly list of ten new French works which are particularly deserving of the attention of the public, more especially of Americans One book will be chosen from each of the following categories intellectual life, history and political science, economics, industry, commerce and finance, novels, poetry and art, ancient and modern literature and literary criticism, philosophy and sociology, law, medicine and foreign travels These monthly lists will be published in French and English and will be sent to libraries, universities, editors, publishers and interested individuals in America

Gift to the Medical Faculty of Strasbourg

At the last session of the University of Strasbourg announcement was made of a gift to the medical faculty by Messrs Andre and Edouard Michelin of French government bonds yielding an annual income of 50 000 francs This is to be used for creating a prize for that scientist of France or allied nations who shall first discover an effective preventive or remedial agent for tuberculosis by experimentation on guinea-pigs or cattle The donors do not desire that human experimentation be undertaken From now and until the prize shall be awarded, the income is placed at the disposal of the Faculte for the establishment and support of a laboratory devoted exclusively to research on tuberculosis under direction of the professor of hygiene and bacteriology of the medical faculty

In choosing the University of Strasbourg for the award of the new prize, Messrs Michelin are giving expression to the feeling of pleasure which pervades all France at the return of Alsace and Lorraine to France, and they are testifying to their trust in the future of the great city where Pasteur did his earliest work

Under the special regulations which will govern the award, the candidates for the prizes must furnish proof of the efficacy of the remedial agent before a committee composed of the dean of the medical faculty of Strasbourg, one professor named by the council of the faculty, the director of the Institute of Hygiene and Bacteriology of Strasbourg, the director of the Pasteur Institute of Paris, and a professor named by the council of the medical faculty of Paris

Death of Professor Demons

Dr Demons, former professor of clinical surgery at the Faculte de medecine de Bordeaux, died recently at the age of 78 Born in 1842 at Saint-Ciers-de-Canesse (department of the Gironde), Demons studied medicine at Bordeaux University was appointed surgeon to the hospitals of Bordeaux in 1869, and at the foundation of the medical faculty became associate professor of surgery In 1886 he was made professor of clinical surgery, which position he occupied until his retirement in 1911 Dr Demons was national correspondent for the Academie de medecine from 1882, and was one of the organizers of the French congress of surgeons, over which he presided in 1891

Clinical Units in Medical Schools

A new departure which consists in the formation of "clinical units" in the medical schools, has already been mentioned in these columns The University Grants Committee has issued an important memorandum on the subject, pointing out that their origin is twofold the advance of medicine itself and the evolution of the form of medical education Medicine itself was revolutionized in western Europe first by the renaissance, and then in our own times by the advance of biology in the middle of the last century, and the discovery of the etiology of infective disease in the last half of the century These things gave a new content to medicine and formed the basis of profound changes Then, in the second place, there has been an evolution in the education of the physician A century ago he became a physician by apprenticeship, this was followed in due course by what may be called the hospital system—in other words, an application of the apprenticeship system on a large scale in the wards of a hospital, lastly, there came the more systematic education of the medical student in the preliminary sciences and the intermediate subjects before he was trained on the clinical side The clinical unit is not a sudden offshoot or "outcrop," but a further stage in a long process of evolution The relation to the state to this evolution began with various medical acts, and more recently the subsidizing of medical education by the government In 1912, Abraham Flexner's Report on "Medical Education in Europe" was published, and *inter alia* it advocated a development of medical teaching by the formation of clinical units

The British system of clinical teaching has been an applied apprenticeship by means of clerking and dressing, which has at least four great advantages (1) The student himself became an observer and a physician, (2) a close personal relationship was established between the student and patient, (3) the art of medicine was taught by practice, and (4) the student was holding a responsible office and cultivating his sense of responsibility These four points have proved invaluable, and have resulted in producing a good standard of physician, perhaps indeed the best in the world But there are disadvantages (1) The student's work tends to become empiric and not sufficiently inspired by the science of medicine, (2) the student is in the main brought into associa-

tion with the end-results of disease, and is insufficiently equipped to deal with disease at its beginnings, (3) instruction in clinical work tends to become discontinuous and unsystematic, his studies in biology and chemistry, in anatomy, physiology and pathology are systematized and organized on a scientific basis, his clinical instruction is, on the contrary, in a large degree unorganized

While these virtues are great, the defects are serious and they become more serious from the advances of medicine They are greatest in London, which has not a centralized teaching university like Edinburgh and other university centers, where the germ of clinical units and, indeed, almost their essentials have existed These conclusions are reached 1 The latest advances in sciences which affect medicine—chemistry and physics, anatomy and physiology pathology and pharmacology—should be continually brought into the teaching of the clinical subjects and applied to the observation and treatment of disease 2 In order that education may be of this scientific standard and that students may come into direct contact with knowledge at its growing point, there is needed a system of instruction by teachers actively engaged in scientific research 3 Such teachers must be provided with proper equipment, adequate staff and sufficient time if their work is to be comparable with the best scientific and practical teaching of say a professor of physiology The system of clinical units is designed to secure these ends It should consist of three parts or units which should be interrelated and separable, dealing with medicine surgery and obstetrics (including gynecology) respectively In each of these subjects a clinical unit should include a professor or director, who would devote the greater part of his time to teaching, treatment and research, competent above everything else to teach, of sound scientific training and possessing scientific imagination, who shall have (*a*) an adequate whole-time and part-time staffs, (*b*) the control of wards (from fifty to 100 beds) (*c*) a proper and effective outpatient department, (*d*) ample laboratory accommodation for research and pathologic work, (*e*) adequate scientific equipment for effective clinical teaching and (*f*) a postmortem service Such units should work along with and supplement the ordinary ward services, in which practical teaching will still be carried on as before But while the ordinary services are organized only for the immediate needs of the patient and the practical training of students the clinical unit will, in addition, be especially equipped for scientific instruction and scientific research

Dangerous Drugs Bill

The second reading of the dangerous drugs bill in the House of Commons has taken place In moving it, Major Baird, undersecretary to the Home Office said that it was to give effect to the international opium convention of 1912, which aimed at controlling throughout the world the traffic in opium and cocain and their preparations During the war, Great Britain found it necessary to take action on her own account, owing to the spread of the cocain habit and the smuggling in the East, which caused trouble and delay with our merchant shipping in connection with China A regulation was made to control the manufacture sale and distribution of cocain, and a proclamation was issued prohibiting the importation of cocain or opium except under license These measures did not prove altogether successful owing largely to the difficulty of controlling smuggling of an article which could be brought in in such small quantities and so easily concealed as opium The only effective control must come from international cooperation The allied powers attached so much importance to this question that the ratification of the international convention of 1912 was made one of the conditions of peace, and embodied in the peace treaty The bill seeks power to extend the provisions of the measure to any new derivative of morphin or cocain, or any drug likely to produce the same effect as these substances

Munificent Rockefeller Gift to Medicine

The Rockefeller Foundation has offered the following gifts for the furtherance of medical education and research in this country To University College Medical School the sum of $2,000 000 "toward a building and equipment program, substantially as submitted by the authorities of the school, and the further sum of $2 175,000 toward the support of clinical facilities and teaching in substantial conformity at the outset with the proposed plan" making a total of $4 175 000 for the medical school To 'the University of London in behalf of the University College, the sum of $950 000 toward a building and equipment program substantially as submitted by the authorities of the college and the further sum of $900 000 toward the endowment of laboratory teaching in substantial conformity at the outset with the proposed plan," making a total of $1,850 000 for the college and a grand total of $6,025,000 At a meeting of the staff and students the provost of University College said that he believed that the gift was the greatest single one ever made for educational purposes in this country In moving a resolution of appreciation for this munificent and spontaneous gift, Dr Elliott Smith, professor of anatomy in University College, said that it would insure that the requisite facilities for anatomic teaching and research, in close conjunction with those in physiology and pharmacology would be provided in accordance with the scientific requirements of the time The general scheme of anatomic teaching in this country was in a curious position There was for instance, no equipment for allowing students to study, in the anatomy department, such parts of the body as could be seen only by the artificial aid of a lens or lenses There were no facilities for showing sections of embryos or for allowing students to study this essential part of their work. Nor were there any facilities for the study of the experimental factors which determined the form of the body It was now hoped to bring back to anatomy the parts of the subject, such as histology and embryology which had been taken away from it It had been the settled policy of University College to restore anatomy to the position which it should occupy, not only in the medical curriculum but also in the field of research

Socialistic Methods and Eight-Hour Day in Hospital Work

Since the radical change of government came into being in this country one institute after the other has been conducted on socialistic lines with only little attention being paid to the desirability of such measures from the standpoint of effectiveness In the hospitals also all the latest ideas in regard to socialization have been introduced In addition to inaugurating the eight hour day, a working board (Betriebrat) had to be elected from among the hospital staff in such a way that each group of employees delegated a number of representatives to this board the physicians, the nurses the clerks the artisans the machine hands and the patients have their representatives The board is the real manager of the hospital which 'runs the whole thing No person be it physician or charwoman may be dismissed without the counsel of the board and the dietaries as well as the regulations of the daily work are controlled by this council Naturally, such a condition which the medical staffs have repeatedly but vainly opposed only tends to hamper seriously the efficacy of the medical work By the adoption of the eight hour day through-

out the whole state in all occupations, the number of nurses had to be trebled, and the men engaged in permanent work (engines, automobiles, stoves) in the hospitals are now working in three shifts, meaning a double or treble expenditure Things have taken such a turn that a few weeks ago a clinical attendant who had not protected the interest of the charwoman in a sufficient degree roused the anger of the majority of the working board of our general hospital They demanded his dismissal for that reason Of course, this demand was not fulfilled by the government But the union of the hospital directors and heads of the ward addressed, in their turn a memorandum to the board of health (the government), pointing out that the present conditions are intolerable They chiefly demand that the unduly large nonmedical hospital staff be reduced While in peace time and even during the war, two or three nurses were sufficient to minister to all needs of the patients of a ward, and stood always in close contact with their patients, now eight or ten nurses are attending the same number, without even a fraction of former satisfaction to the patients Formerly, utmost care was extended, now carelessness is not infrequent The nurses, the real sisters of former times, have been replaced by a female nursing officer who works eight hours, not a minute longer, like a factory girl

Naturally, the bad effect is felt by all patients, from 6 a m to 2 p m one sister nurses him, from 2 to 10 p m another, and then the night sister Severely ill patients do not get the attention they require, furthermore the number of patients in many hospitals is nearly equal to or exceeds but slightly the number of persons employed in the hospital an unnatural condition The consequence is that each patient costs the hospital from 65 to 85 kronen a day in the municipal hospital, even 115 kronen, while the hospitals get from the public treasury only 78 kronen It is impossible to make both ends meet under such circumstances These conditions tend to turn the hospitals into 'asylums for nurses and hospital employees' as the memorandum styles it, and are a crime against public interests The directors also make concrete suggestions toward the satisfactory working of their institutes

They first of all demand that only such nurses be employed as are prompted to their work by the earnest desire to give real help to the sick and all patients—not merely to put in eight hours All sisters should be housed within the hospital, as is the case in all other civilized countries They should be unmarried If they marry, they may be employed in the outpatient department, in the laboratory or in private nursing but not in the wards of surgical theaters The medical staff, female or male, should be subject to the same restriction As long as they work in the wards or clinics, they should be single and live in the hospital Whole time appointments should be the rule The interests of the hospital require all the skill of the physician The clerks and other members of the hospital may be appointed in such numbers that they complete their work in the normal eight hours, but they must actually work and not merely play politics Of course they cannot be denied the right to take advice in matters pertaining to their work but it is an impossible condition that through the working board each man feels Nothing can happen to me, I cannot be dismissed" The consequence is that the efficiency of the work has suffered very severely The memorandum demands that the directors should be entitled to dismiss without the assent of the board every person who does not fill the post he is in and allot to him the work he is fit for The arrangement of working boards is not suitable for public hospitals or humanitarian institutes, working not for profit Their influence must be limited to advisory and disciplinary measures, but must not interfere with the effective working of the hospital and the financial situation of all these institutes must be taken into consideration, without paying attention to political desiderata

Holland Assists the Libraries of Austrian Scientific Institutes

An appeal for books and periodicals for our libraries has found a lively response in Holland these last few weeks By the activity of Dr Dijkgraf, the ancient University of Leyden and the technical school of Delft have arranged collections of such works and publications as are mostly needed for our schools The action will extend not only to books, but also to scientific material (glass tubes, chemicals and dyes) and to money contributions to enable the institutes to run for a while, at least on part time Parts of these gifts have arrived already, and were distributed where they were most wanted It may be added that the technical laboraotry of our university, for instance, only just escaped being closed for want of material

Contamination of the Milk Supply

The supply of milk to Vienna has for a long time been a matter of serious concern both to the board of health and to the board of nutrition The quantity of 900,000 liters (about 220 000 gallons) required daily has not even approximately been reached for about four years Milk tickets had to be handed out to infants and children up to 6 years, entitling them to from 0 25 to 1 liter daily, according to age, if the milk was obtainable As a rule, only infants under 1 year get about 0 75 liter (a pint and a half), the other children getting about half this allotted quantity, or none at all, as luck might bring Lately even these reduced supplies were cut down still more and a high percentage of the milk arrives in a sour condition, while a large quantity of the remainder has been pronounced contaminated by the inspecting officer In fact no ordinary cows milk is now delivered to Vienna which is fit to be given to an infant This is chiefly due to a curtailment of the railway traffic, owing to the lack of coal, and to the ill will of the peasant population, which refuses to send food to Vienna Condensed milk has to be imported on a large scale from England America and Switzerland to feed our children But the exorbitant price, due to exchange rates, is a bar to the extended use of this substitute, as far as the great bulk of our population is concerned, while the fresh cows milk arriving in antiquated vessels, and obtained by primitive methods, is not a reliable form at all

Marriages

JOHN JONIKAITIS, Boston, to Miss Carolyn A Eckes of Jersey City, N J in New York City June 24

FREDERICK WILLIAM FERGUSSON, Starkweather N D, to Miss Laura Jane Johnston of Chicago, June 2

WARREN JAMES DUCKETT, Jersey City N J, to Miss Clara Belcher Hopkins of Dover, N H, April 19

FREDERICK HOWARD FALLS, Chicago, to Miss Margaret Haseltine of Berkeley, Calif, recently

DANIEL SCHENK LEE Guymon, Okla to Miss Lillian Erline Willoughby of Liberal, Kan., May 11

ERNEST WALTER TONKIN to Miss Florence Bertha Hicks, both of Edwardsburg, Mich, June 24

SIMON HARRY ROSENTHAL, Lynchburg Va, to Miss Bettye Greenberg of Danville Va, June 6

EDWARD HAGOP BEDROSSIAN to Miss Angele S Adourian, both of Philadelphia, April 28

JOHN PEARL GOODRICH to Miss Isabelle Esther O'Leary, both of Bangor, Me, June 26

JULIUS ARKY HAIMAN to Miss Frances Alexander, both of New York City June 20

BENJAMIN BARKER BEESON to Miss Mildred Helen Bronson, both of Chicago, recently

Deaths

Major-General William Crawford Gorgas ⊕ former Surgeon-General of the United States Army and President of the American Medical Association in 1909-1910, died in London July 4 Early in May, General Gorgas left the United States for the west coast of Africa, to head a sanitary commission of the Rockefeller Foundation, arriving in London, May 19 He proceeded to Brussels, where he was decorated by King Albert, and after a tour of Belgium and of the Rhine district around Coblenz, he returned to London Here he suffered an attack of cerebral hemorrhage on the morning of May 30, since which day he had been critically ill at Queen Alexandra Hospital, where he was attended by Brig-Gen Robert E Noble, U S Army and by medical officers of the British Army Full military honors were accorded to him at his funeral, July 9, at St Paul's Cathedral, London, which was attended by representatives of King George and of the government services, and by members of the medical profession and the scientific world His body will be returned to the United States in a government transport.

William Crawford Gorgas, the son of Gen Josiah and Amelia Gayle Gorgas, was born at Mobile, Ala, Oct 3, 1854 In 1875 he graduated A B from the University of the South, after which he studied medicine at Bellevue Hospital Medical School receiving his M D degree in 1879 He served an internship at the Bellevue Hospital and then entered the Army as surgeon with the grade of lieutenant, June 16, 1880 His first service was at Fort Brown, Texas, where he contracted yellow fever, a circumstance which influenced and guided the future career of the young physician Under military occupation of Cuba from 1898 to 1902, Dr Gorgas served as health officer of Havana, which had a long history of endemic yellow fever with periodic outbreaks in epidemic form When late in 1900 the Army yellow fever board under direction of Major Walter Reed discovered the causative relation of the stegomyia mosquito to the transmission of yellow fever, Major Gorgas immediately directed practical measures of control based on that discovery, with the result that by the end of 1901, Havana and its environs were free from the disease for the first time in centuries In recognition of this brilliant achievement in preventive medicine, Dr Gorgas was promoted in 1903 to colonel and assistant surgeon-general by special act of Congress, in 1904 as chief sanitary officer of the Panama Canal, and later as member of the Isthmian Canal Commission, he directed the intensive sanitary campaign which transformed a veritable 'pesthole of the Pacific' into habitable domain and made possible this triumph of American engineering without the great sacrifice of life which had doomed all earlier attempts to failure He was nominated surgeon-general, Jan 16, 1914 with the rank of brigadier-general and by special act of Congress in 1915, he was created major-general for life in reward for his scientific attainments in the sanitation of the Canal Zone He served as surgeon-general virtually throughout the World War, and reached the statutory age limit, Oct. 3, 1918, only a few weeks before the signing of the armistice, but continued on special duty until the end of hostilities

General Gorgas was in international request as an authority on hygiene and sanitation and repeatedly advised foreign governments regarding special medical problems At the invitation of the British government he went to South Africa in 1913, and there made important recommendations for the prevention and control of pneumonia among the miners In 1915, he headed a commission under the auspices of the Rockefeller Foundation to study the foci of yellow fever and other tropical diseases in South America and Central America He made further investigations in Ecuador after the war

In recognition of his services to humanity and his contributions to science, he was the recipient of marked honors from the governments, universities and learned societies of many countries He was awarded the Distinguished Service Medal of the United States and was made commander of the Legion of Honor of France, he was knighted by King George of England and decorated by King Albert of Belgium, as well as by rulers of other foreign countries Honorary degrees were conferred on him by the University of Pennsylvania, University of the South by Harvard, Brown Alabama, Tulane, Johns Hopkins, Oxford, Lima and other universities He was awarded the Mary Kingsley medal from Liverpool School of Tropical Medicine (1907), a gold medal of the American Museum of Safety (1914) and a special medal from the American Medical Association (1914) Besides being President of the American Medical Association in 1909-1910 he was a member of the American Society of Tropical Medicine American Public Health Association, and Association of Military Surgeons, honorary fellow of the New York Academy of Medicine, and of the College of Physicians of Philadelphia and associate member of the Societe de pathologie exotique de Paris

WILLIAM CRAWFORD GORGAS, 1854-1920

Frank Edwin Brown, Brooklyn, Columbia University, College of Physicians and Surgeons, New York, 1903, aged 40, captain, M R C, U S Army with service in France with Base Hospital 62 at Mars-sur-Allier and in the St Mihiel and Argonne offensives and discharged May 14, 1919, a specialist in surgery, a member of the Medical Society of the State of New York, a member of the attending staff of the Methodist Episcopal Hospital Brooklyn died in that institution, June 23, after a surgical operation

Finley Ellingwood, Chicago, Bennett College of Eclectic Medicine and Surgery Chicago 1878, aged 68, professor of chemistry from 1884 to 1900 and of materia medica and therapeutics from 1900 to 1907 in his alma mater, editor of the *Chicago Medical Times* from 1884 to 1906, author of several textbooks on eclectic materia medica and therapeutics, died at Pasadena, Calif, June 29

Charles Daniel McCarthy, Malden, Mass , University of the City of New York, 1882, aged 59, a member of the Massachusetts Medical Society and once president of the Malden Medical Society, one of the founders of and surgeon to the Malden Hospital, and at one time mayor of the city, died June 22, from cerebral hemorrhage

M H E Whitesides, Timpson, Texas, Memphis Tenn Hospital Medical College, 1888, aged 62, once president of the Shelby County Medical Society, for eight years chief surgeon of the Houston East and West Texas and Texas and Gulf railways, appointed a member of the State Board of Health in 1909, died, June 10

George Edwin Davenport, Vancouver, B C., University of Vermont Burlington 1889, aged 57, formerly surgeon of the Colorado Midland Railroad, a member of the International Association of Railroad Surgeons, for several terms a mem-

⊕ Indicates 'Fellow of the American Medical Association

ber of the New Hampshire state legislature, died, May 31, from heart disease

James Robert Sanford, Covington Tenn, University of Nashville, Tenn, 1857, Jefferson Medical College, 1857, aged 88, assistant surgeon of the Seventh Tennessee Cavalry C S A, during the Civil War, for several years president of the Tipton County Poard of Health, died, June 21

Frederick W Rogers, Hartford Wis, College of Physicians and Surgeons, Chicago, 1889, aged 57, for more than fifty years health officer of Hartford, and local surgeon for the Chicago, Milwaukee and St Paul System, died, June 15, from cerebral hemorrhage

Benjamin I Berman, Norfolk Va, Medical College of Virginia, Richmond 1909, aged 46, a member of the Medical Society of Virginia, while crossing a street, June 16, was struck by a motorcycle, and died from his injuries fifteen minutes later

Claude Humphrey Addleman, Indianapolis, Indiana University, Bloomington and Indianapolis, 1920, aged 26, an intern in the City Hospital Indianapolis, died in that institution, June 16, from septicemia a week after a surgical operation

George F Cline, Columbus, Ind, University of Louisville Ky 1893, aged 56, a member of the Indiana State Medical Association, coroner of Bartholomew County, died in the Southeastern Indiana Hospital, Craigmont, from arteriosclerosis

John Lyon, Greenwood, S C, Medical College of the State of South Carolina Charleston 1900, aged 46, a member of the South Carolina Medical Association, for several years a member of the State Board of Medical Examiners, died June 21

Oliver P Hopping, Mt Pulaski, Ill, Illinois Medical College Chicago, 1896, Missouri Medical College, St Louis, 1897, aged 50, died at St Johns Hospital Springfield, Ill, June 11, from pneumonia following influenza

William Preston Snyder, Kimberton, Pa, University of Pennsylvania, Philadelphia 1873, aged 63, formerly auditor general of Pennsylvania, state senator, and representative, died, June 20, from cerebral hemorrhage

Rufus Walter Athey ⊕ Marietta, Ohio, University of Wooster, Cleveland Ohio, 1890, aged 55, died in Tremont Hospital Marietta, June 5 from hypostatic pneumonia, eleven days after an operation for appendicitis

John Menzer Ward, Manchester, Tenn, Medical College of Indiana, Indianapolis, 1882, Rush Medical College, 1893, a member of the Tennessee State Medical Association, died, June 9, from cerebral hemorrhage

Lawrence D Neary, Torrington Conn, Georgetown University, Washington D C 1913 aged 32, a member of the Connecticut State Medical Society, died at the home of his father in Waterbury, June 1

Carey Lee Lamborn, Philadelphia, formerly of Penns Grove, N J, University of Pennsylvania Philadelphia 1896, aged 49, a member of the Medical Society of New Jersey, died, June 24

Andrew Jackson Davis, Charleston, Iowa (license, Iowa years of practice 1886), aged 75, a practitioner for forty-five years, died at the home of his daughter in Keokuk, Iowa, June 15

John Christopher Mitchell, Brockville, Ont, Trinity Medical College, Toronto 1875, for ten years superintendent of the Ontario Hospital for the Insane, Brockville died, May 2

John P Paxton, Paterson N J, Long Island College Hospital, Brooklyn, 1872, aged 69, a member of the Medical Society of New Jersey, died, June 16, from heart disease

Otis H Deck, Herkimer, N Y, Albany (N Y) Medical College, 1894, aged 56, a member of the Medical Society of the State of New York, died June 13, from heart disease

R M Henderson, Wake Ark, license, State Medical Board, Arkansas, 1903, aged 82, for forty-three years a practitioner of Baxter County, died, June 18, from senile debility

Hiram J Hampton, Tampa, Fla, Georgia Eclectic Medical College Atlanta 1879, aged 68 formerly secretary of the eclectic board of examiners of Florida, died, June 7

Thomas F Wurtsbaugh, Richwood, Ohio Eclectic Medical Institute, Cincinnati, 1886, aged 75, a veteran of the Civil War, died, June 19, from pulmonary tuberculosis

Clayton C Quillian, San Antonio, Texas, Atlanta Ga Medical College, 1886 aged 61, a member of the State Medical Association of Texas, died, June 18

Correspondence

"THE IMMEDIATE STERILIZATION AND CLOSURE OF CHRONIC INFECTED WOUNDS"

To the Editor —Dr Hyman's letter (THE JOURNAL, June 12, 1920, p 1663) concerning the dangers attendant on the method of closing chronic infected wounds published in THE JOURNAL, May 8, illustrates the serious error into which one may fall who does not read carefully If one after ample opportunity to observe the method in use at Fort McPherson can comment as does Dr Hyman in his letter, it shows that even the simple concept expressed in the title of the article has not been grasped and an explanation for those who may not carefully note the directions and warnings given of necessity with brevity in the original article is offered For efficient sterilization a powerful, penetrating caustic, zinc chlorid, is used, the safety in the use of which depends, first, on the surgeon's ability to prevent its entering the blood stream during its application and secondly, on the prompt operative excision of all tissues impregnated with the caustic Our experiments of which Dr Hyman quotes only the control, show that zinc chlorid is rapidly converted by the blood into a nontoxic compound Thus while a fraction of a drop of a saturated solution of zinc chlorid rapidly injected into the marginal ear vein of a rabbit is instantly fatal, a drop of this caustic held in the ear veins three minutes by compressing the base of the ear produces no systemic effect Likewise, the temporary use of a tourniquet protects in the dog when several minims of the saturated solution are injected into the saphenous vein In human practice no systemic symptoms have been observed when a tourniquet has prevented the entrance of blood from the injected area into the body during and for five minutes after the injection For regions that cannot be guarded by a tourniquet, the zinc should never be applied by forcible injection but by packing all sinuses with cotton pledgets wrung out of the solution Having introduced the caustic especially if in the region of important structures the surgeon is morally obliged to excise promptly all the chlorided tissue Dr Hyman's reference to frequent hemorrhages after the use of this method is based on two cases in which operation was performed in my absence that well illustrate what is not the method and what the surgeon should not do In the first case, a sinus from the femur, there was inadequate exposure of the bone and an incomplete excision A jagged edge of femur was left against the exposed femoral artery and the wound filled with Dakin tubes After about ten days of Carrel-Dakin treatment, recurrent hemorrhages requiring ligation occurred and finally resulted fatally In the second case, a perforating sinus of the femur the external half of the sinus was properly treated by sterilization excision and suture, but the important inner half of the sinus close to the femoral artery was drained and the chlorided tissue not excised As would be expected, the corrosion progressed to violent hemorrhage on the third day, and partial gangrene of the foot followed a ligation of the femoral artery That we had no case of secondary hemorrhage or paralysis in our series of about 350 cases treated by the method is due to the fact that thorough excision and immediate suture were considered the most important parts of the operation One need not hesitate to treat sinuses adjacent to a large vessel if he has the skill to excise them properly The danger of the method lies far less in the zinc chlorid than in the timidity and incompetence of the surgeon, and even one clumsy enough to cut a hole into the femoral artery, as I did in one case, may escape ill results if he does an immediate arterial suture and carefully surrounds

the artery with living muscle To excise timidly and incomplely, to drain or to 'Dakinize" is contrary to the technic and is to invite danger and failure The skin may be left open to avoid tension, but the deep tissues must be well opposed The method was by far the most efficient treatment for chronic infected wounds that was tried at Fort McPherson, and at the Army Hospital at Fox Hills while the method was temporarily abandoned until the need of a tourniquet was appreciated the wounded soldiers themselves requested that it be resumed, and Capt Donald Cragin reports very satisfactory results in about ninety cases Only with the exodus of the reserve officers experienced in this method to civilian practice, and entirely against the desire of the commanding officers, was this treatment discontinued at Fort McPherson

PRESENTATION OF CRAMPTON BLOOD PTOSIS TEST IN 1904

To the Editor —In the article on "A Cardiovascular Rating as a Measure of Physical Fatigue and Efficiency," by Major Schneider (THE JOURNAL, May 29, 1920, p 1507), reference is made to my "blood ptosis test' as being presented first in 1913 with two other tests This is in error My test was first presented at the Olympic Congress in St Louis in 1904 It was published in the *American Physical Education Review* in 1905-1906 in an extended article on 'Recent Investigations in Sciences Underlying Physical Education" It was then published in the *New York Medical News* Sept 16, 1905 The error is no doubt merely an inadvertence Its correction, however, is important and I would be grateful if you would be good enough to print this statement

MODES OF CONVEYANCE OF SCARLET FEVER

To the Editor —In Anders Practice of Medicine Edition 13 p 198 speaking of the modes of conveyance of scarlet fever the statement is made that the disease may also be transferred by persons who have been in the sickroom while they themselves e cape Outside of the possibility of harboring the germ in the mouth nose or throat in what manner could the disease be transferred? Again the statement is made that it is also communicated by fomites and the poison of car latina contained in the clothing retains its infective power for months ' and any objects (furniture books utensils toys etc) which the patient has handled may serve to communicate the poison' and again the infection may be air borne though not for any great distance Are the foregoing statements supported by the weight of authority today? Aside from the conveyance by direct contact with the infected patients when they sneeze cough or expectorate or from drinking glasses or eating utensils is there a single reliable instance in which the germ of scarlet fever has been carried by fomites or in the clothing and in this way spread and communicated? How could there be communication on account of the patient s handling furniture books or toys? Has any one ever obtained a culture from the desquamation scales? What proof is there that it is an air borne disease even for a short distance unless one is in close proximity to the infected patient and comes in contact with the sputum or droplets from the mouth or nasal ecretions? Finally if all that is necessary is individual quarantine and isolation of the patient why enforce a rigid household quarantine and follow by the useless formaldehyd fumigation when recovery has taken place? HENRY FARRELL M D Kearney Neb

ANSWER —The general conception of the mode of conveyance of scarlet fever assumes that the essential cause of the disease is present in the secretions from the throat, nose, ears etc

If this assumption is true, then anything which is contaminated by such secretions and mechanically carries them may serve to spread the disease Such carriers include a large number of animate and inanimate agents, such as hands eating and drinking utensils, clothing toys foods and air In the absence of strong currents, air will carry moist particles only a short distance before they fall to the ground from their own weight Foods may not only mechanically carry the scarlet fever virus but also furnish conditions in which it will multiply It is generally thought that the essential cause of scarlet fever remains alive and virulent after drying and that this may be true for a long time if the disinfecting action of light is excluded In this way have been explained apparently well-authenticated instances of scarlet fever transferred by toys, clothing, etc, even after a long time

Since the cause of scarlet fever has not been identified cultures from desquamation scales, etc, would add no information of value For the same reason it is impossible to speak of the mode of spread of scarlet fever with the same accuracy and assurance as can be done with diphtheria and typhoid fever

If personal isolation is efficiently accomplished there is little apparent reason for household quarantine There has been a disposition among hygienists in recent years to substitute for formaldehyd fumigation which is often of doubtful value thorough airing and sunning and the liberal use of soap and water

THE NATURE OF MEDICAL PRACTICE ACTS

To the Editor —Why are osteopathy and chiropractic allowed to be practiced if they have no scientific basis?
Please omit my name and address A R

ANSWER —The regulation of occupations professions and trades by the state comes under what is known as the police power of the state This is the right of the state to restrict and regulate the acts of its citizens for the public good Medical practice acts are not for the benefit of the medical profession or for its protection against competition It is not the business of the state to settle scientific questions regarding the relative value of different methods of treatment of disease All the state can do for the protection of the public against ignorant and incompetent persons is to establish educational standards or qualifications and to require all persons who desire to follow certain occupations professions or trades to comply with those standards or qualifications This is what the majority of laws do so far as the medical profession is concerned they establish a standard for those who treat the sick which standard requires certain educational and professional qualifications Physicians comply with these requirements, they have to do so But as the standard for physicians is too high for practitioners of certain cults—osteopaths, chiropractors, Christian Scientists, etc—certain legislatures have passed laws exempting them We are not able to answer our correspondent s question because we do not know why legislatures pass such contradictory legislation

ARTIFICIAL RESPIRATION IN THE NEWBORN

To the Editor —Would you please let me know when was first described in the United States the method of artificial respiration for the newborn apparently asphyxiated which is known in France under the name of American or Dewes method and mentioned by Professor Audebert in 1897 in the *Journal de médecine de Bordeaux?*

J O TOULOUSE France

ANSWER —J Harvie Dew described his method before the New York Academy of Medicine in 1893 His paper Establishing a New Method of Artificial Respiration in Asphyxia Neonatorum ' was published in the *Transactions* of the New York Academy of Medicine 1893 p 80, and in the *Medical Record* **43** 289 1893 and *Buffalo Medical and Surgical Journal* **33** 665 1893 A Spanish translation was printed in *Anales de obstetricia, ginecopatia y pediatria* **14** 104, 1894

REMOVAL OF MERCUROCHROME STAINS

To the Editor —Please suggest some efficient remedy to remove mercurochrome stains from the clothing without injuring the cloth and color B F Rockford Ill

ANSWER.—Mercurochrome stains may be removed from the skin by rubbing first with 2 per cent potassium permanganate solution and then with 2 per cent oxalic acid solution (THE JOURNAL Jan 3, 1920 p 31) This method m[illegible] be tried for stains on cloth As a prelim[illegible] determine whether or not this of the cloth itself This is L ment to an out of the way p

THE PRINCIPLES OF ANATOMY AS SEEN IN THE HAND By Frederic Wood Jones D Sc M B B S Professor of Anatomy in the University of Adelaide Cloth Price $5 net Pp 325 with 125 illustrations Philadelphia P Blakiston's Son & Co 1920

Frederic Wood Jones is a scientific anatomist whose previous work shows that he desires not only knowledge but also understanding He says "In the study of the hand we are immediately brought face to face with some of the most important biologic problems and some of the most striking exhibitions of general principles It is for this reason that the hand has been selected as a limited and self-contained study from which the student may learn more of principles and less of details than is usual in complete textbooks of anatomy" The book may be commended to those who, earnest in the cause of medical education, see the fundamental sciences only from the practical side, and who believe that teachers of anatomy should have the surgical point of view Jones has seen "well taught but wholly unlearning students" who have been trained by such teachers, and he is sorry for them By methods of patient drudgery and brute force of memorizing they have learned many dead facts about the dead hand But it is not a dead hand which the author invites the student to consider in this book. It is one full of character and life—of life which has been continuous from the beginning of life on the planet and of character which has been slowly but clearly stamped on the living structures as we have traveled the long road of evolution "Man's place in nature is largely writ upon his hand" The author considers whether these characters are new or were acquired long ago far back along the road and so became firmly impressed on the tissues, whether they are progressive or regressive whether they are highly specialized in the human animal or whether they are a part of the original heritage of the stock No study of structure can be intelligent which is not also a study of function The author considers the hand as a working part of a working organism Its efficiency depends not only on its own structure but more on the capacity and control of its cooperation "It is the lower animals which show the anatomical advance from a primitive condition which we retain but as a cortically controlled structure the human hand affords striking evidence of man's superiority over all the other members of the mammalia It is not the hand which is perfect but the whole nervous mechanism by which movements of the hand are evoked, coordinated and controlled' In considering the mechanism of this control Jones regards the tissues as living things, and their study is endowed by him with vital interest Although the book is limited to the hand, the author has made a valuable contribution to the study of anatomy in general, for no student can study one organ as he will be led to study the hand through this book without developing habits of observation and of thinking, and these are permanent General principles if only they are seen even in but one part, illuminate every other part and the mind of the student so that the study of structure can never again be uninteresting drudgery but will rather be a source of ever renewed interest satisfaction and understanding

THE PRACTITIONER'S MANUAL OF VENEREAL DISEASES WITH MODERN METHODS OF DIAGNOSIS AND TREATMENT By A C Magian M D Ancien Eleve de l'Hopital St Louis Paris Cloth Price $3 St Louis C V Mosby Company 1919

The author states that this book was written only for the general practitioner but he indulges in lengthy excursions into the history of syphilis and gonorrhea, and furnishes in another chapter an elaborate description of the technic of the Wassermann test Inaccuracy in using medical terms and in describing pathologic processes is frequent throughout the text He says 'Sloughing and gangrene may follow' One might suggest that sloughing is the consequence of gangrene The author overlooks the important differentiation between incontinence and frequency of desire for urination The views of the author with regard to pathology are illustrated by the statement that continuous straining may cause abscess

and fistula Inflammation of the testicles is defined in parenthesis as gonorrheal epididymitis, and this is followed by the remark that the affected testicle swells rapidly That in treatment of acute anterior urethritis the author recommends the forcing of permanganate solution, administered by percolator irrigation, through the urethra into the bladder, will cause many a urologist to raise his eyebrows To mention packing of the urethra with medicated gauze in the treatment of gonorrheal urethritis is unnecessary, to say the least In the chapter on treating syphilis, the author enumerates sixty different drugs, every one of them obsolete as to use, after having cautioned the reader to purge his library of all but the most modern textbooks and pamphlets on syphilis It may be doubted whether subcutaneous and intramuscular injections of neo-arsphenamin may be given without any risk, as the author asserts Such immature attempts at hurriedly writing a medical book cannot be too severely criticized

VENEREAL DISEASE ITS PREVENTION SYMPTOMS AND TREATMENT By Hugh Wansley Bayley M C Cloth Price $4 25 net Pp 102 with 54 illustrations Philadelphia P Blakiston s Son & Co 1920

Another attempt to cover the prevention, symptomatology and treatment of the venereal diseases in a book of 146 pages, and—another failure The only chapters that come up to the standard of such a publication are the one on Legislation and Prophylaxis and one on Instructions on Conducting a Venereal Clinic Only colored pictures may be expected to be instructive in the diagnosis of syphilis, but the crudeness of the black and white plates presented destroys even the limited claim to usefulness that noncolored illustrations may have It is surprising to have a supposedly professional pathologist tell us that a urethral discharge may be caused by gout or rheumatism, and to have him use the term "tubercular" instead of tuberculous' epididymitis, or have him divide the symptoms of intolerance to arsenic compounds into vasomotor and toxic symptoms In the treatment of syphilis he does not mention the use of intravenous injections of mercury, so useful in nervous and eye complications Epididymotomy does not find a place in the chapters on gonorrhea and its complications, and the author fails to call attention to the importance of early operation for prostatic abscess The Guyon capillary catheter also seems to be unknown to the author A plate meant to illustrate the microscopic appearance of a gonorrheal smear taxes to the utmost the imagination of the reader The comic relief in the tragedy of gonorrhea is furnished when the author, in discussing latent gonorrhea, reminds us that "criminals who are wanted by the police do not frequent the main thoroughfare, but frequent the sidestreets and alleys, so the gonococcus may lurk unsuspected in ducts and glands that surround the urethra along its whole length" Teaching is an art, and writing a medical textbook calls for more thorough preparation and more concentrated application to the work than is manifested in this publication

UEBER HAMOPHILIE BEIM WEIBE Kritische Studie nebst Erorterung der gynakologischen Blutungen Von Prof Dr C Bucura Paper Price 11 20 marks Pp 92 Vienna Alfred Holder 1920

The sum and substance of this monograph on hemophilia in the female is that there is no such thing as hemophilia in the female An analysis of 197 cases reported as such in the literature leads the author to the conclusion that not one of these cases meets the requirements for establishing the existence of true hemophilia according to the strict definition of the disease This conclusion is in harmony with the prevailing view that true hemophilia is a hereditary disease, transmitted from father to grandson through the daughter without the daughter, herself, exhibiting the disease Cases of excessive tendency to hemorrhage in the female are always to be attributed to some other cause than true hereditary hemophilia, a point of importance in diagnosis and treatment The author's investigations throw no new light on the etiology of hemophilia He accepts the view that it must depend on an inherited chemical abnormality of the protoplasm of the formed elements of the blood and of the vessel walls Possibly lack of thrombokinase in the blood platelets is an important factor, although there is no general deficiency in the thrombokinase

Illegal Quarantine to Examine for Venereal Disease

(Ex parte Dillon et al (Calif), 186 Pac R 170)

The District Court of Appeal of California, Second District, Division 1, in ordering that these petitioners for a writ of habeas corpus be discharged from the custody of the chief of police of Los Angeles, says that they were arrested, without a warrant, for the alleged violation of a city ordinance which made it unlawful for any person to resort to any rooming house, lodging house, hotel or other place in the city, for the purpose of having therein sexual intercourse with a person to whom he or she was not married, and they were held in a sort of quarantine It appeared that whenever persons arrested for violating this ordinance were brought to the city jail they were, by the chief of police, held without bail and under a pretended quarantine by reason of a general instruction given by the health department of the city, and without any knowledge being had on the part of the health department or its inspectors which would give rise to reasonable cause, or suspicion, that the persons so detained were afflicted with contagious or infectious venereal disease It was stated that for two years or more it had been the practice of the health department to examine all persons brought to the city jail charged with the violation of the ordinance or charged with any other offense involving sexual immoralities or lewdness, to determine the freedom of such persons from contagious and infectious quarantinable venereal disease, that about 1,000 persons had been examined within such time, and that about 90 per cent of the women so arrested and charged were found to be afflicted with contagious and infectious venereal disease in some form

The right of the health authorities to subject the person of an individual afflicted with contagious disease to quarantine restraint is an extreme measure, recognized as being necessary in cases of epidemics and instances in which such detention is necessary to protect properly the public health Sick persons who are subjected to such quarantine are not deemed to be criminals, and are to be treated with every consideration and afforded conveniences reasonably procurable under the circumstances

The court assumes, for the purposes of this case, that the arrest was legally made It may be assumed too that under the laws relating to the public health inspection and quarantine may be made of persons animals and property by the duly constituted health authorities, when it is known, or appears on reasonable ground, that the person so subjected to inspection or quarantine is afflicted with contagious or infectious diseases such as are enumerated in Section 2979 of the Political Code But the question here was whether the health department might reasonably assume, without any previous knowledge information or report as to the individual concerned, that every person arrested by officers and booked at the city jail as having violated the rooming house ordinance was reasonably likely to be afflicted with a quarantinable venereal disease Virtually the health officers through their orders to the chief of police, said to the individual

We don t know whether you are guilty of this offense or not if you were guilty we think it would furnish reason to suspect that you are afflicted with a venereal disease but whether guilty or innocent you have been arrested and you must remain confined without bail and without being permitted communicaton with the outside world except with our consent until you have submitted to a private examination and convinced us that you are free from the taint of disea e

The bare statement of this proposition, considered in view of all the safeguards which have been thrown around the liberty of the individual, is shocking to our sense of justice When sufficient cause exists to believe that a person is afflicted with a quarantinable disease, there is no doubt of the right of the health authorities to examine int c case and, in a proper way determine the f nary investigation must be made without in- ing is found to be justifiable only

may be resorted to as are reasonably necessary to protect the public health, it being remembered that the persons so affected are to be treated as patients, and not as criminals

Recovery for Services Not Supported by Evidence

(Huntley v Geyer (N D), 175 N W R 619)

The Supreme Court of North Dakota reverses a judgment that was obtained by the plaintiff for services, and remands the case for a new trial, because improper evidence was admitted and necessary evidence was lacking The court says that it appeared from the evidence that the professional services for which the plaintiff, a physician and surgeon sought to recover were rendered in the treatment of one Walter Geyer, a son of the defendant At the time the services were rendered Walter Geyer was about 24 years of age He was making his home with his parents but was operating an adjoining farm for himself The plaintiff testified that about a certain date one of Walter Geyer's brothers came to the plaintiff's office and informed the plaintiff of Walter's illness and obtained some medicine for him The plaintiff further testified that at that time the brother stated that he had been sent by the defendant to consult the plaintiff with regard to Walter's illness This testimony was admitted over the objection that there was no showing that the son who called on the plaintiff had been authorized by the defendant to do so, and that the alleged statements were hearsay as to the defendant and inadmissible The objection was overruled and the evidence admitted but the supreme court is of the opinion that it was error to permit the plaintiff to testify to the statements which he claimed the defendant's son made at the time he called the plaintiff to treat Walter Geyer The defendant denied that he had sent the son, or had in any manner requested or authorized the calling of the plaintiff The plaintiff made no showing whatever that the son had actually been sent by the defendant Clearly the plaintiff's testimony as to what the son said would not be admissible to prove that the defendant had sent him It was purely hearsay And in view of the condition of the evidence in the case the court is not prepared to say that the admission of the evidence did not affect the result

The defendant contended also that there was no evidence tending to show either that the compensation of the plaintiff had been agreed on or that his services were reasonably worth the amount awarded, and the court believes that this contention was well founded There was no evidence tending to show that the amount of the plaintiff's compensation was fixed by agreement Nor did the plaintiff or any one else testify that the services rendered by the plaintiff were reasonably worth the amount for which the plaintiff recovered judgment or any other amount The plaintiff contented himself by stating what he had done, and identifying certain charges he had made on his books therefor Nowhere did he testify that the services were reasonably worth what he charged for them In the absence of an express agreement as to amount, the law implies a promise to pay for a physician's services as much as they are reasonably and ordinarily worth on the professional market When a physician seeks to recover for such services, he has the burden of proving their value

May Testify to Making Examination but Not as to Result

(Livingston v Omaha & C B St Ry Co (Neb) 175 N W R 667)

The Supreme Court of Nebraska says that in this personal injury case, in the direct examination with respect to her physical condition before the accident the plaintiff testified that she never had any venereal disease or taint, nor had she taken any treatment for any ailment of that sort The examining physician for the juvenile court testified that it was her duty to examine those coming under its care, that in her official capacity she examined the plaintiff in 1911, when she was brought by the juvenile authorities to her for that purpose, and that from the examination she reached a conclusion as to the plaintiff's condition at that time, that in 1912 the plaintiff came voluntarily and received treatment On objection by the plaintiff, the witness was not permitted to testify respecting the plaintiff's condition in 1911, nor as to whether she discovered anything abnormal in her condition in 1912 Another physician, who was called by the defendant, was permitted over objection, to testify that the plaintiff had called on him for an examination before her marriage and before the accident But he was not permitted to answer the question as to for what purpose, or to determine for what that examination was made The supreme court sees no error in this It holds that when a plaintiff offers testimony in chief tending to prove freedom from venereal disease it is competent for the defendant to offer testimony tending to show that the plaintiff called on and was examined by a physician, but such physician cannot testify as to the result of his examination

Cutting Hole in Bladder—Skill and Care Required

(Kennard v Westerman (Mo) 216 S W R 938)

The Supreme Court of Missouri, Division No 1, in affirming a judgment for $15 000 damages in favor of the plaintiff says that it was alleged that the plaintiff, being troubled with a fibroid tumor of the uterus, went to the defendant for an operation for its removal he having represented to her that he was specially skilled in the performance of such operations having performed 500 operations of like character The alleged negligent acts on which the case was submitted to the jury were that, in performing the operation, the defendant negligently and unskilfully cut a hole in the plaintiff's bladder, and that either during the operation or during one of the operations thereafter performed by him, he so cut or tied off the plaintiff's left ureter as to cause it entirely to lose its functions and to atrophy and to cause the plaintiff's left kidney also to lose its functions and to atrophy The defendant admitted that he cut the hole in the plaintiff's bladder but averred that it was not negligently done but that it became necessary for him to make such cut in removing the tumor He also admitted having performed two subsequent operations for the purpose of closing the hole but averred that they were unsuccessful for the reason that the parts were diseased

Negligence may be inferred from the facts If the legitimate inferences which may be drawn from the facts establish negligence the case of negligence is made To a woman friend that was in the operating room at the solicitation of the plaintiff, the defendant said "That is a perfect operation, perfectly successful" Not a word was said about cutting the bladder Nor did the defendant tell the plaintiff about it for a month during which time he was telling her and her friends that she was getting along nicely Then, when the plaintiff complained about the constant flow of urine, and told him that she believed he had injured her bladder he said that he had cut the bladder and taken out the diseased portion and there would have to be a second operation Moreover when the necessity arose for a third operation, and the plaintiff wanted an eminent physician called in to assist the defendant became enraged and used some rather forceful language, with the result that the operation was performed without the presence of the other physician The very conduct of the defendant tended to show guilt Besides all this, the plaintiff was examined both before and after these operations by different physicians, and none of these found any evidence of a cancerous or diseased condition, nor did the surgeons who afterward operated three times to get the cut closed The evidence also showed that the cutting or tying of the ureter would kill the kidney, and it tended to show that the plaintiff had been normal in all these parts, but now there was no life in the left kidney A fair inference from these facts would indicate that the defendant had destroyed the left ureter in one of his operations There was no error in submitting the case to the jury by the overruling of the defendant's demurrer to the evidence of the plaintiff

Nor was there error in an instruction which told the jury that the defendant as a surgeon having undertaken to operate on the plaintiff and remove a fibroid tumor and the uterus, 'in performing this operation it became and was his duty to exercise reasonable skill and care as an ordinarily skilful and careful surgeon is accustomed to exercise and use in

like surgical operations under like circumstances" It was contended that the instruction covered the whole world's physicians, while the defendant's efficiency should have been gaged by "the degree of skill possessed by reasonably skilful surgeons in the community in which he is practicing" But the court holds that that contention cannot be sustained There should be no limiting to the local vicinity of the practitioner The weight of authority is against that doctrine

But, even if the instruction was technically wrong, this would not avail the defendant in this case The plaintiff sued him as a specialist in this line of operations The rule applicable to his case has been stated thus

> A physician holding himself out as having special knowledge and skill in the treatment of particular diseases is bound to bring to the discharge of his duty to a patient employing him as such specialist that special degree of skill and knowledge possessed by physicians who are specialists in the treatment of such diseases in the light of the present state of scientific knowledge

Insufficient Indictment for Practicing Illegally

(People v Devinny (N Y) 125 N E R 543)

The Court of Appeals of New York, in reversing a judgment of conviction of the defendant of practicing medicine without a license, holds insufficient an indictment which accused the defendant "of the crime of practicing medicine without being registered and legally authorized (as required by Section 161 of the Public Health Law) committed as follows The said Devinny, on May 27, 1918, and for a considerable time immediately prior thereto, at Albany, in this county, unlawfully practiced medicine, he not being then registered and legally authorized" as in the statute required and provided The court holds that the indictment was not defective because it did not negative all of the cases set forth in Section 173, enumerating cases not to be affected The court says that in the case at bar if it should be held that an indictment must negative all of the cases referred to in the statute as not being unlawful it would be drawn out to intolerable lengths, and even after that had been done, the burden doubtless would rest on the defendant of proving that he came within the excepted cases But the court thinks that it was necessary for the present indictment to set forth one detail of the alleged offense, which in this particular case would very likely involve and lead to setting forth generally the details of the offense It is abundantly established that in charging an offense committed on or in respect of an individual, as diagnosing, treating or offering to diagnose or treat, a disease, it is necessary to name, or excuse naming by proper allegation, such individual There is an exception to this general rule When the crime consists of a series of acts continuous in their nature such as carrying on a prohibited business, or keeping an unlawful resort, a general description reasonably including and describing the series, will be sufficient It is not necessary in such cases to set forth each act going to make up the offense In the court's opinion, however, this indictment does not come within that exception It does not seem to the court that the statute was intended to define or constitute the prohibited offense as consisting of a continuous series of acts amounting to the conduct of a business within the decisions referred to It may be that if the court had nothing but Section 161 prohibiting the 'practice" of medicine, and were relegated to the dictionary or common usage for a definition of that word, the court would be compelled to interpret it as meaning a continued and habitual performance of acts But the court is not thus left to these means of reaching a definition Section 160 defines what practice means Its meaning is satisfied whenever and as often as an individual "holds himself out as being able to and offers or undertakes to diagnose, treat," etc Whenever within the fair meaning of those terms on a single occasion an offender has held himself out as able to and has offered to treat a patient there has been a completed offense, and it is not necessary to show that this operation has been repeated so many times that it has ripened into a habit or business If this is the correct interpretation there is no question that the individual operated on should have been named or proper excuse given for not naming him even within what has been said in cases applying the 'business" rule

Society Proceedings

COMING MEETINGS

Montana State Medical Association Helena July 14 15

AMERICAN PEDIATRIC SOCIETY

Thirty Second Annual Meeting Held in Highland Park Ill May 31 June 2 1920

The President, DR THOMAS S SOUTHWORTH, New York, in the Chair

Segregation of Pneumonia

DR THOMAS S SOUTHWORTH, New York Segregation of pneumonia patients may have been practiced by thoughtful physicians, but the idea has not found its way into the general medical conscience, nor has it been advised widely in our literature Evidence of the infectiousness of pneumonia is not wanting I have for years insisted, when possible, on the prompt isolation of the first case of pneumonia among children having measles, with a resulting limitation of the number of cases and I have extended segregation to all the pneumonias The obligation is imperative to anticipate the day, not far distant, when the movement to control the scourge of pneumonia may make the retention of such cases in the general ward as repugnant to our medical sense of propriety as the retention of an open case of pulmonary tuberculosis

Studies on Blood Sugar Effect of Blood on Picrate Solutions Limitations of Lewis-Benedict Method

DRS DAVID MURRAY COWIE and JOHN PURL PARSONS, Ann Arbor, Mich Blood contains substances other than sugar which induce a color change in the picrate solution employed in the modified Lewis-Benedict blood sugar method Under normal conditions these substances do not interfere with the established normal range for this method Under pathologic conditions several of these substances which showed the most marked influence were epinephrin acetone and diacetic acid Creatinin may interfere but does so in a less marked degree if we consider the comparative nonsensitiveness of the picrate solution to these substances

DISCUSSION

DR OSCAR M SCHLOSS New York It seems probable that under normal conditions it is an essentially accurate clinical method though it has a moderate error such as is present in any colorimetric method I have used the Lewis-Benedict method and a control series in which the method of Bertrand was used The Lewis-Benedict method gives results that are constantly higher but the difference is consistent and does not influence the results of observations made in normal cases

DR DAVID MURRAY COWIE, Ann Arbor, Mich The effect of heat on picrate acid solutions has been a matter of discussion, and very different opinions are held The experience of Addis and Benedict, as well as our own, is that the prolongation of the heat produces an increase in the intensity of the color In regard to the acetone, we have not run tests beyond ten minutes, but up to that time a color change has been produced

Epidemic Lethargic Encephalitis

DR L E LA FETRA New York It is evident both from the difference in the lesions and from the results of animal experimentation that poliomyelitis and epidemic encephalitis are distinct diseases I have not found that this disease follows influenza with sufficient regularity to warrant one in stating that it is caused by influenza though influenza may predispose the patient to infection or increase the virulence of the prevalent virus Of eleven children four died There was no relationship between any two of the patients and they did not live in close proximity to each other In only two was there any history of influenza When the disease was well under way the outstanding features were lethargy, general weakness and ptosis or paralysis of the

ocular or facial muscles, with double vision in several instances In the fatal cases the leukocyte count was higher than in the cases ending in recovery The spinal pressure varied In most cases globulin was present, with increase in the number of cells The fluid was sterile on culture Recovery took place very gradually Two patients showed serious sequels, one imbecility and one spasticity and mental impairment The disease has to be differentiated from tuberculous meningitis, poliomyelitis, cerebrospinal syphilis, brain tumor and meningism The mortality of the disease is about the same as that of poliomyelitis In how many damage to the brain may show later it is too soon to state

DISCUSSION

DR ROWLAND G FREEMAN, New York According to accounts, the disease has invariably occurred after influenza and not after other conditions Little is known with reference to the ultimate results of the disease, however, the outcome is not altogether favorable

DR HENRY HEIMAN New York It is sometimes impossible to differentiate between epidemic encephalitis and tuberculous meningitis if the tubercle bacillus cannot be found Loewe and Strauss have shown that the disease can be diagnosed by animal inoculation The eyes should be examined to detect the presence of choroid tubercles

DR CHARLES GILMORE KERLEY New York The symptom that has impressed me in this disease is the great variability of the symptomatology Only one symptom is constant, and that is the high degree of stupor, which resembles opium narcosis

DR. JOHN HOWLAND Baltimore The disease is more common than is generally believed and is difficult of recognition in its atypical forms on account of the relatively slight changes in the spinal fluid Sequels may persist for a long time We have had patients return on account of abnormal symptoms particularly at night Some have been apparently normal in the daytime but at night exhibited an almost maniacal condition This sleeplessness may last for weeks

DR ALFRED HAND, Philadelphia One patient slept twenty hours out of twenty-four and showed double ptosis Another patient had double ptosis of the eyelids, strabismus, and slight rigidity of the neck Lumbar puncture revealed the spinal fluid under pressure The fluid contained no tubercle bacilli, which excluded tuberculous meningitis

DR OSCAR M SCHLOSS, New York Encephalitis occasionally complicates measles and scarlet fever Last winter I saw two such cases The symptomatology of so-called "encephalitis lethargica" is practically identical with the sporadic cases seen for some years

Significance of Xanthochromia of the Cerebrospinal Fluid

DR ISAAC A ABT, Chicago My patient was 37 days old at the time of death and of eight months' gestation Specimens of fluid contained red cells, increased globulin and increased cell count, most of the cells being polymorphonuclears Necropsy revealed a fibrinous hemorrhagic meningitis and encephalitis There were subpial hemorrhages marked internal hydrocephalus, subacute pyelitis and bronchopneumonia

DISCUSSION

DR J MILTON MILLER Atlantic City, N J This condition was present in a child 3 weeks old The first and second lumbar punctures were negative Ventricular puncture revealed a yellowish, gelatinous fluid not coagulated

Acute Cerebrocerebellar Ataxia

DR J P CROZER GRIFFITH, Philadelphia This condition is not common, but it occurs more frequently than is ordinarily supposed—an acute hemorrhagic encephalitis involving the cerebellum, and which may be designated acute cerebellar encephalitis There are always symptoms indicating an involvement of the large brain as well, and for these the title cerebrocerebellar encephalitis or cerebrocerebellar bulbar encephalitis is to be preferred The degree to which the process involves one or another part of the brain varies In the majority of cases some infectious disease has preceded the attack The prognosis, so far as life is concerned, is good The disease leaves no traces in the majority of instances Lumbar puncture was performed in all my cases and was always negative

Nature of Reducing Substance in Urine of Children Suffering from Nutritional Disorders

DR OSCAR M SCHLOSS, New York My experiments do not confirm the work of Langstein and Steinitz showing that this reducing substance is lactose or galactose The only reducing substance which we have found constantly present in perceptible amounts has been glucose There is usually a nonfermentable reducing substance similar to that found in normal urine This may be lactose, but its amount is too small to identify it with certainty

DISCUSSION

DR DAVID MURRAY COWIE, Ann Arbor, Mich In these cases in which you did not find a reducing substance like glucose or lactose did you run the acetone test?

DR HENRY HEIMAN New York Was an attempt made to exclude glucose and then to test for pentose and galactose?

DR OSCAR M SCHLOSS, New York Acetone and creatinin would of course be present in the nonfermentable fraction Both substances were excluded the acetone by boiling and the creatinin by first precipitating with mercuric nitrate solution If pentose was present it could be present only in the nonfermentable fraction The proportion was so small that it was difficult to determine its presence with any degree of certainty

Relation of Bodily Mechanics to Cyclic Vomiting and Other Obscure Intestinal Conditions

DRS FRITZ B TALBOT and LLOYD T BROWN, Boston Poor bodily mechanics are surprisingly prevalent among children and can easily be corrected by proper exercises or an abdominal support Correcting the improper posture often corrects chronic constipation and hastens the cure of recurrent vomiting and the cure of certain types of attacks of acute abdominal pain in children

DISCUSSION

DR CHARLES GILMORE KERLEY, New York I have found practically the same things true except that I have always attributed the faulty posture and distension of the abdomen primarily to a defect in the intestinal tract A roentgen ray study of these cases almost invariably reveals an elongated sigmoid It is remarkable what an abdominal support will do for these patients It seems to me it is the faulty structural condition rather than faulty mechanics that is the primary cause of the trouble

DR GODFREY R PISEK, New York The use of the lead tape to show the changes in the curve of the back chest and abdomen when the patient is in proper and improper posture is a great help in the correction of faulty posture

Epidemic of Hemorrhagic Diarrhea Due to Streptococcus Mucosus

DR A D BLACKADER Montreal Canada Of sixty-five cases the larger proportion were children under the age of 6 years The attack began abruptly with high fever, nervous symptoms and vomiting and diarrhea set in early Mucus and blood appeared in the stools and the amount increased rapidly until in the severe cases they seemed to form almost all of the stool The attack lasted from a few days to twenty-one days The presence of *Streptococcus mucosus* in the stools associated with other streptococci and large numbers of colon bacilli, and the absence of any *Bacillus dysenteriae* indicated that the streptococcus must be regarded as the chief organism in the production of the epidemic The milk supply seemed to be excluded as the source of the epidemic

Phlyctenular Ophthalmia and Its Relation to Tuberculosis

DRS BORDEN S VEEDER and T C HEMPELMANN, St Louis Of 196 children with phlyctenular disease, skin tuberculin tests were positive in more than 92 per cent The results of the complement fixation tests for tuberculosis were strik-

ingly similar to those obtained in cases of proved tuberculosis Tuberculous lesions involving other organs than the eye were definitely demonstrable in more than one half, and seemed probable in almost two thirds of the cases Children observed over periods of one year or more showed an even greater proportion of tuberculous lesions, more than four fifths of this series giving such evidence Cough, malnutrition and a history of exposure to other cases of tuberculosis were frequent.

DISCUSSION

DR JOSEPH BRENNEMANN Chicago Dr Gibson and I found a positive tuberculin test in 98 per cent of the cases We started our investigation thinking phlyctenular disease was not a tuberculous condition, and we left it convinced that it was either a manifestation or an accompaniment of tuberculosis Finding this condition, however, is not sufficent ground for saying that a child has tuberculosis

DR HENRY J GERSTENBERGER, Cleveland Another factor that may have some relation to this condition is the exudative diathesis If one takes a careful history of children with tuberculosis it will be found that many have eczema or intertrigo

DR FRITZ B TALBOT, Boston In a series of 100 cases of phlycenular disease, 21 per cent showed signs of tuberculosis In chronic cases of phlyctenular disease the von Pirquet tests were all positive, though many of the children showed no other signs of tuberculosis

DR. T C HEMPELMANN We obtained a very slight history of lesions attributable to exudative diathesis Such statistics as we were able to obtain showed phlyctenular disease no more frequent in children having the exudative diathesis than in others We employed old tuberculin in the treatment of these cases, starting with 0 000001 mg, and we have not been convinced that either local recovery or general improvement resulted

Pneumonia in Infants and Children

DR HENRY HEIMAN, New York Of 336 cases of pneumonia in children, 288 were bronchopneumonias and forty-eight were lobar pneumonias The mortality was 16 6 per cent With the exception of the 2 to 5 year period, the mortality varied inversely with the age A variety of organisms were found in the sputum, including the influenza bacillus, pneumococcus, streptococcus and staphylococcus, but none in sufficient predominence to justify conclusions The most frequent complication was otitis media, which occurred in seventy-five of the 336 cases Of prime importance in the treatment of pneumonia in children is hygienic care and efficient nursing I would not recommend the general use of digitalis in children, since, as a rule, the pulse is not lowered or the blood pressure raised by this agent The promiscuous use of dry cupping is to be condemned

DISCUSSION

DR ROWLAND G FREEMAN, New York There is no method of treating pneumonia so valuable as fresh air, and the colder the air the better the result I have never seen cold air harm a patient with pneumonia, and I have seen it do a great deal of good For many years I did not use digitalis in children, but recently I have been using it in large doses and have found it valuable, especially when given early to older children

DR A D BLACKADER, Montreal, Canada Alcohol may be used with advantage in some cases It should be used as a drug and the dose carefully regulated Digitalis disturbs the stomach Fresh air is desirable but the line should de drawn at flowing air and drafts Rest is most important, and for this reason hydrotherapy should be used with moderation

DR RICHARD M SMITH, Boston To conserve the outgo of energy it is a good plan to give codein

DR E W SAUNDERS, St Louis Potassium iodid is useful to loosen up a tenacious sputum that blocks the bronchial tubes, and is responsible for keeping the temperature higher than it otherwise would be

DR. HENRY HEIMAN, New York I am in favor of fresh air but not cold air, fresh air contains as much oxygen as cold air In the application of hydrotherapy I never use a cold sponge, if cold water is not used, fear and shock are avoided Potassium iodid does no good

Relative Efficiency of Mercurial Preparations in Treatment of Congenital Syphilis

DRS WALTER R RAMSEY and O A GROEBNER, St. Paul Mercurial ointment, 50 per cent, is to be preferred to the less concentrated preparations, and should be repeated not more often than twice weekly instead of daily Calomel ointment is absorbed less rapidly and to a less extent than mercurial ointment and should therefore be given in greater concentration twice weekly Mercuric salicylate in oil should be given hypodermically twice weekly instead of once Mercuric chlorid by hypodermic injection, although the dose is very small, continues to be eliminated for several days, but the fact that its use is frequently followed by the appearance of protein in the urine should exclude it from the treatment of syphilis Calomel by mouth is absorbed in small amounts and continues to be eliminated for a considerable time so that it is probable that it would be sufficient to give it at intervals of several days without producing diarrheas Mercury with chalk is absorbed to a small degree and eliminated rapidly so that fairly large doses repeated daily would probably be necessary to maintain mercury in the circulation

Incidence of Hereditary Syphilis

DRS P C JEANS and JEAN V COOKE St Louis The histologic examination of the placenta as to the presence or absence of syphilitic changes corresponded to the established diagnosis in 95 5 per cent of the cases The lack of correspondence consisted entirely in finding no syphilitic changes in the placenta in cases in which the infant had syphilis In every instance in which the placenta was noted as showing syphilitic changes, the infant was found later to have syphilis The Wassermann reaction on the placental cord blood corresponded to the diagnosis in the infant in 96 5 per cent Here also the discrepancies were entirely due to finding a negative Wassermann reaction in the fetal blood when the infant was syphilitic In every instance in which the fetal blood gave a positive Wassermann reaction the infant was later found to have syphilis In 1,000 cases examined there was an incidence of 5 5 per cent among the poor of the white race, 16 per cent among negroes, and 10 per cent among the whole group of dispensary cases The incidence among the combined middle and upper classes was 1 5 per cent The total incidence in the whole series was 6 per cent

DISCUSSION

DR. HENRY J GERSTENBERGER, Cleveland Among 20 000 patients we found an incidence of syphilis of 14 per cent There was little difference in the incidence of syphilis as determined clinically alone and that since the Wassermann test has been employed

DR L R DE BUYS New Orleans The Wassermann test should be made on each infant no matter what the mother's reaction may be I have seen mothers negative from the Wassermann standpoint and in perfect health and yet their children were decidedly syphilitic and gave a positive Wassermann reaction I have also seen the mother give a negative Wassermann reaction, and one twin would be negative and the other positive

DR LANGLEY PORTER San Francisco In a small series of 118 cases we found that unless the blood was heated we had a good deal of trouble with the anticomplementary properties of the cord blood Of this number, 6 5 per cent were syphilitic

Lesions of the Midbrain

DR J H MASON KNOX Baltimore A child aged 3 years gradually developed bilateral ptosis, partial paralysis of the ocular muscles and a coarse tremor followed by ataxia These symptoms persisted for three months until the child died At necropsy a tuberculoma the size of a hickory nu was found in the midbrain, involving the corpora quadri gemina and occluding the aqueduct of Sylvius

Action of Boiled Pancreas Extract on Yeast Nucleic Acid. W. Jones, Baltimore.—p. 203.

Psychic Secretion of Gastric Juice.—The sight alone of a table well set with nourishing foods was found by Miller and his associates to give rise to a distinct secretion of gastric juice in normal men. Odor alone produced less stimulation than sight alone. The tasting and chewing of food in the absence of smell or sight produced no marked psychic secretion. The combined influence of the tasting, chewing and smelling of food was pronounced and much greater than that of smell alone. The sound and thought alone of a frying steak gave rise to a gastric secretion. The influence of smell with hearing produced little additional effect. Evil odors depressed secretion to the level of the continuous secretion. Foods unpleasantly prepared, or unpalatable in appearance, odor, taste and belief in their unwholesome character led to delayed acid response and evacuation. Newspaper reading during the course of a meal could not be shown to have any distinct influence on gastric digestion.

Gastric Response to Tea, Coffee and Cocoa.—A study was made by Miller and others of the influence of water, tea, coffee and cocoa on the gastric digestion of a uniform mixed meal as measured by the acid responses and evacuation times. Evacuation of the stomach was not appreciably delayed by the drinking of 1 liter of cold water, cold or hot tea, hot coffee, either plain or with cream or with cream and sugar. The addition of sugar alone to coffee delayed evacuation. Cocoa in 1 liter quantities markedly delayed evacuation. To a less extent this was true of half-liter volumes. One liter quantities of water hot or cold tea, hot coffee plain or with cream, delayed somewhat the rise of the level of intragastric acidity as compared with the basal meal alone. As high acidities and normal evacuation were, however, attained these beverages must have stimulated gastric secretion, been rapidly evacuated, or more probably both. Coffee with sugar alone delayed the development of gastric acidity. Coffee with sugar and cream had less effect. Cocoa delayed distinctly the development of intragastric acidity. One liter quantities of tea and coffee gave rise to marked acceleration of the heart beat to vasomotor relaxation, tremors and other nervous symptoms. Cocoa did not produce these effects but brought about a feeling of fulness at the stomach. Urine secretion during the first ninety minutes after tea or coffee ingestion varied from 550 to 866 c.c. after cocoa from 125 to 372 c.c.

Relation of Blood Proteins to Shock.—According to Whipple and his associates, a fatal shock reaction is almost constant following even a moderate plasma depletion preceded by liver injury. This would indicate that the liver cells are particularly concerned in the peculiar shock reaction which may follow plasmapheresis and lowering of the blood plasma protein values. It may be that this type of "shock" is not unlike the common "surgical shock." The evidence of these experiments gives strong support to the theory that in "shock," there is a primary cell injury which precedes the familiar clinical reaction.

Organ Perfusion.—The authors maintain that much of the work done with organ perfusion is of little value because a proper appreciation of the limitations of the method does not obtain among laboratory workers. The use of physiologic sodium chlorid solution, Locke's solution or various modified solutions with or without red blood corpuscles does not permit of physiological perfusion of organs. The contact of these salt solutions with the tissue cells will result in profound injury or actual cell destruction.

Effect of Tobacco on Ergographic Response.—On the basis of the results obtained in Raphael's study, it appears that under the influence of tobacco smoking, a distinct periodicity may be demonstrated in the curve of ergographic response, arising apparently as a result of central nervous system fatigue or depression.

Capillary Blood Pressure in Man.—A method for the study of capillary blood pressure is presented by Danzer and Hooker which differs from all of the previous methods in the criterion at which the readings are taken. It depends on the production of stagnation of the flow of corpuscles in the capillaries. With this method capillary pressure in man can be determined in the fingers and in the toes. The average capillary blood pressure in normal individuals was 22.2 mm. Hg. Cold lowers and heat raises capillary blood pressure. Posture was found to vary capillary pressure although the hand was at heart level at all time. It was lowest in the recumbent, highest in the standing and midway between in the sitting posture. The diurnal variation is very slight. Increased intrathoracic pressure raises capillary pressure. Diminished intrathoracic pressure lowers capillary pressure. Venous compression causes an increased capillary blood pressure. The authors believe that the prevalent conception that the redness of the skin is due to its capillaries and that pallor means capillary emptying is erroneous. While undoubtedly capillary contributing somewhat to the color of the skin, nevertheless the role of the capillaries is rather slight. The venous plexuses principally contribute to the color of the skin. The collapse of these plexuses is the principal cause of skin pallor resulting from compression. The authors propose as the name of their apparatus, the 'microcapillary tonometer.'

Stammering and Brain Volume.—Pronounced shock, fear of stammering and emotions of every kind always brought about increase in brain volume accompanied by increased size of pulse in Robbins' patient.

Finger Exploration of Brain Wounds.—Of the 61 cases of head wounds discussed by Towne and Goethals 22 were scalp wounds, 11 were fractures, with intact dura, 28 patients had an open dura with brain wound. The 11 scalp wounds and 22 fractures with unopened dura brought out nothing of

interest The mortality in these cases is practically nil unless other wounds are fatal, as happened twice in this series This report is concerned with the 28 cases of wound of the brain of which 20 were operated and 8 were inoperable These patients were treated with the conception that the problem involved was the absolutely complete removal of contaminated damaged brain, blood clot, hair, cloth, bone and metal, so that primary suture might result in clean healing The method adopted was to suck and irrigate out the brain and clot and then extract with fine forceps bone and metallic fragments detected by a gentle palpating finger, provided the cavity was sufficiently large to admit the finger The size of the hole in the dura was not taken as an index, but was enlarged if necessary In some cases this finger technic, always (with one exception) preferred if possible, was contraindicated by the small size of the track in brain substance, or by the awkward situation of wounds caused by missiles passing in via the deep nasal sinuses, in these instances cleaning was done as well as possible with catheter and forceps Of the 28 cases 8 were considered inoperable and died without intervention in a few hours, 20 were operated, and of these, 7 died, giving a mortality of 35 per cent Of 13 evacuated cases, 12 healed by first intention, and the other developed a septic brain fungus, which was not fatal after a prolonged attempt to clean a cavity by the catheter forceps technic In only one instance did routine postoperative examination show a slight and temporary increase in the signs of brain injury Several cases are reported in which it seems highly improbable that the foreign bodies could have been removed without finger palpation Later results in the 13 evacuated cases for periods of from six to twenty-one months after operation show that there were no late abscesses, that six patients were working that major epilepsy developed twice, and that two only can be considered as not distinctly subnormal

Foreign Bodies of Dental Origin in Bronchus—There have been at the Mayo Clinic during the past four years seven cases of pulmonary suppuration following dental operations or trauma In two cases the tooth was spontaneously expelled, in one it was discharged through a thoracotomy wound, and in one it was found at postmortem In the other cases no foreign body was found, but it is quite probable that they were also cases of infection from inhalation Hedblom has collected forty-five proved cases from the literature These fifty-two cases form the basis of this report

Compression Fractures of Lower End of Radius—Stevens maintains that fractures of the lower end of the radius (so-called Colles) are always compression fractures, the compressive side breaking first, literally collapsing The first point of fracture is the point of greatest compression on the cortical surface of the bone because the stress increases both in compression and tension the further away from the neutral axis It breaks in compression because the compression is much greater than the tension Early reduction followed by early passive and active motion will return all or nearly all compressive fractures of the radius to useful light occupation within twenty days Any retentive apparatus other than a leather wrist strap after ten to twelve days is contraindicated except in a very rare instance

Sarcoma of Stomach—The total number of authenticated cases of sarcoma of the stomach now recorded, Douglas says, is 230 with a probably larger number on record, the reports of which are not available Of a total of ninety-two operative cases, sixty-nine were resections either of the exogastric tumor or of part of the stomach and twenty-three were either gastro-enterostomies or exploratory laparotomies Sarcoma of the stomach occurs in 1 per cent of all stomach tumors The average age of incidence is 41 6, in contrast with an average age of 61 2 for carcinoma Round cell and lymphosarcoma are the most frequent forms found They are more apt to be infiltrating, but the round cell may project into the stomach or form pedunculated tumors They result in ulceration oftener than in other sarcomata but not as frequently as in carcinoma Spindle cell and myosarcoma are apt to form large exogastric tumors The diagnosis can rarely be made with certainty, the roentgen-ray examination furnishes the most useful evidence

Treatment of Chronic Arthritis—Fifty per cent of the cases of chronic arthritis treated at the Stanford University clinics by the removal of foci of infection showed definite improvement The most striking results were obtained in those cases in which the focus was situated in the genito-urinary tract Very rapid recovery with very few treatments were obtained in those cases in which the teeth were the seat of infection Removal of the tonsils in several cases was followed in a few days by loss of pain, and later by return of function to the injured joint

Radium in Pituitary Disease—In Quick's opinion the application of radium in hypophyseal tumors offers the best chance for an accurate approximation of a well selected dosage with a minimum risk to the patient He reports three cases

Nonsurgical Treatment of Pituitary Disease—In cases of underactivity presumably of the anterior lobe, Timme advises feeding of the whole gland in doses of from ½ grain as infrequently as once or twice a week, up to 1 or even 2 grains three times daily, depending on the reaction of the patient to the dose especially as regards the production of headache excitability insomnia, nausea and vomiting, and rapid fatigability But in addition thereto, either feeding of the anterior lobe or hypodermic injections of the anterior lobe extract will often be found of value especially in the Froelich syndrome with genital lack of development and in low bodily temperatures Very small doses of thyroid gland, 1/100 to 1/10 grain every day or on alternate days will frequently enhance the effect of the pituitary administration In cases of overactivity, treatment depends on the cause for overactivity If this cannot be found and eliminated, then give sedatives such as luminal ½ grain, once or twice a day, for a few days at a time, pilocarpin, 1/10 grain, or acetanilid 2 grains, several times daily, as alternates If disturbances in the genital sphere produce secondary pituitary activity lutein or ovarian extract will be found of benefit When the activity is secondary to a thyroidectomy, then small doses of thyroid gland will relieve the symptoms In too early thymic involution, with pituitary overactivity thymus gland 1 to 5 grains, several times daily is often effective Occasionally, an inefficient chromaffin system will give rise to overactivity on the part of the pituitary which may be offset by feeding whole gland suprarenal extract

Proteins in Dry Spinach Leaves—The authors show that spinach leaves dried at a low temperature and extracted with ether, alcohol, water, and alkaline solutions yield results so similar to those obtained with the fresh green leaf that evidently the constituents of the cells are altered to only a slight degree by drying

Digestibility of Raw Corn, Potato and Wheat Starches—Raw corn and wheat starches were found by Langworthh and Deuel to be completely assimilated and no trace of them could be found in the feces Seven experiments on raw potato starch gave values for its digestibility varying from 62.3 to 95.2 per cent, the average was 78.2 per cent The ingestion of the potato starch caused disagreeable physiological disturbances not noted in the other experiments with raw corn and wheat starches The digestibility of the other constituents of the diet was not affected to any great extent by the large amounts of raw starch ingested

Carbon Dioxid Content of Heated and Unheated Milk—It appears that under the conditions to which normal unheated milk is subjected in its handling from the time of milking to the time of delivery to the consumer, the volume percentage of carbon dioxid rarely, if ever, drops below 3 and seldom below 3.5 while the subjection of normal milk to the conditions of heating used in pasteurization reduces the percentage of carbon dioxid by volume to 2.5 or less Therefore it appears safe in general, to assume that milk containing less than 3 per cent of carbon dioxid by volume has been heated to the temperature of pasteurization

Iodin in Thyroid—A new method is described by Tatum for the separation of cells from colloid of the thyroid gland for chemical study Iodin is found in both cells and colloid of beef sheep and pig thyroid glands The ratio of percentages of iodin in cells to iodin in whole glands appears to be relatively constant for pig sheep and beef thyroid glands even though such glands vary both in morphology and in total iodin content

Proteins in Georgia Velvet Bean—The Georgia velvet bean contains 23.6 per cent of protein ($N \times 6.25$) Two globulins designated as the a and b-globulins may be separated in yields of about 3 and 1.25 per cent respectively, and an albumin is found in extracts which have been freed from globulin by repeated dialysis Analyses of the three proteins show marked differences in the nitrogen and sulphur content and in the distribution of nitrogen as determined by Van Slyke's method Qualitative examination indicates that the B-globulin contains no tryptophan an observation of particular interest in view of the fact that this amino-acid has been found to be present in all seed globulins heretofore tested The a-globulin and the albumin from the Georgia velvet bean both contain tryptophan

Studies on Growth—The hypothesis is presented by Robertson and Ray that the potential longevity of any given individual is determined by the relative velocities of anabolism in the cellular and sclerous tissues, respectively In terms of this hypothesis it is suggested that the prolongation of life which is brought about by continuous administration of tethelin to mice is attributable to an increased velocity of anabolism of distinctively cellular elements to the relative disadvantage, in the competition for nutrients of the connective tissue elements If the administration of tethelin is discontinued prior to sexual maturity the normal proportion of cellular to connective tissues is rapidly restored and exceptionally large animals of normal or abbreviated duration of life are the result

Fat Soluble Vitamin in Carrots—When carrots are saturated with lard or corn oil and then extracted with ether none or little of the fat-soluble vitamin is removed The lard preparation gave no evidence of containing the vitamin but the corn oil preparation contained it in small but persistent amounts Ether has little solvent properties for the fat-soluble vitamin as found in carrots, chloroform and carbon disulphid remove some of it, while alcohol and benzene remove considerable amounts of it None is entirely satisfactory for extraction purposes

Uterus Contracting Principle in Posterior Lobe of Pituitary—Evidence is furnished by Fenger and Hull which indicates that the uterus contracting active principle of the posterior lobe of the pituitary body does not occur in the fresh gland in free or crystalline form, but is linked to or part of some protein complex In its original protein association the uterine stimulus is insoluble in ether, petroleum ether chloroform and practically insoluble in absolute alcohol It is sparingly soluble in 95 per cent alcohol but yields a highly active split product when treated with hot 95 per cent alcohol The split product is amorphous in nature very hygroscopic and much more sensitive to desiccation than the original basic material from which it was derived The crystalline bodies naturally occurring in and isolated from the posterior lobe are inorganic salts possessing no uterus-contracting power Alkaloidal reagents only incompletely precipitate the active fraction of the water extract of the gland

Milk Proteins as Supplement to Cereal Proteins—The results obtained by Hart and Steenbock show that highly efficient protein mixture is not obtained until the proportion of liquid milk to corn meal reaches 1 1, in this proportion the milk nitrogen will constitute approximately 30 per cent of the total nitrogen of the ration

Spontaneous Pneumonia—The close analogy between the epidemic of lobar pneumonia that occurred among monkeys at the Army Medical School and similar epidemics of lobar pneumonia that occurred during the war among certain groups of newly drafted troops shortly after their arrival at camp Blake and Cecil believe indicates that pneumococcus pneumonia may become an epidemic disease among groups of susceptible individuals when they are assembled under conditions that facilitate the ready transfer of infection from

the individual to individual Bacteriologic examination made by Blake and Cecil showed the spontaneous pneumonia to be due in the great majority of cases to infection with pneumococcus Type IV Immunologic classification of the strains of pneumococci by cross-agglutination tests showed that the majority fell into two biologic groups Two cases were apparently caused by *Streptococcus haemolyticus* two by *Streptococcus viridans* Study of the pathology of spontaneous pneumococcus pneumonia in monkeys showed that it presented the characteristic picture of lobar pneumonia, both macroscopically and microscopically, and was in all respects comparable with the pathology of lobar pneumonia, experimentally produced in monkeys and with lobar pneumonia in man

Prophylactic Vaccination Against Pneumonia—Cecil and Blake found that the subcutaneous inoculation of monkeys with pneumococcus Type I vaccine in doses comparable with those employed in man does not protect them against subsequent attacks of pneumococcus Type I pneumonia, either spontaneous or experimental Furthermore, the occurrence of pneumococcus Type IV pneumonia among monkeys that have been vaccinated with pneumococcus Type I lipovaccine indicates that the vaccinated animals develop no cross protection against other types of pneumonia Vaccination doses, however, modify the course of the disease Invasion of the blood stream by the pneumococcus in vaccinated animals is usually slight and the proportion of recoveries is considerably higher for vaccinated than for unvaccinated monkeys Pneumococcus saline vaccine produces a greater amount of protective substance in the serum of the vaccinated animal than does pneumococcus lipovaccine and is probably, therefore, a better antigen Both, however, fail to protect the animal against pneumococcus pneumonia

Effects of Protein on Diabetes—No specific differences were observed by Allen between the glycosuric effects of different kinds of protein Other incidental observations were noted in connection with the records of individual animals General conclusions are deferred to the close of the series

Failures of Dietetic Treatment of Diabetes—Practically every detail of clinical diabetes was reproduced by Allen in partially depancreatized animals Every detail of the downward progress of human patients on various diets in reproduced in such animals Varying degrees of success and failure in the dietetic control of diabetes are also illustrated A claim of saving every patient no matter how near death, Allen says would be a preposterous one for any remedy in any disease, and the animal experiments do not support such a claim for diabetes Also it is unreasonable to expect the actual care of an organic deficiency by diet, and the diet treatment in animals just as in patients generally represents the sparing rather than the restoration of the weakened function The basis of the belief is the inherently progressive tendency of severe cases of clinical diabetes is shaken by the exact reproduction of such case histories by diet in animals which are free from spontaneous downward tendencies, but there is still lack of a sufficient number of patients treated on the principle of relief of the total metabolic burden to demonstrate the absence of such inherent progressiveness in human diabetes

Influence of Heavy Metals on Isolated Frog Heart W Salant and H Connet—p 217

Reaction of Uterus to Strophanthus and Calcium—The investigations made by Ransom show that the movements of the excised cat's uterus which have been diminished or arrested by placing it in a Ringer's fluid containing no calcium, are restored and usually increased by the addition of strophanthus The effect of quite a short exposure of uterine muscle to strophanthus is to make it extraordinarily responsive to calcium It is suggested that some forms of postpartum hemorrhage may be due to subsistence on a diet poor in calcium affecting the efficiency of the uterine muscle, and that in such cases strophanthin might usefully be injected intravenously

Point of Attack of Epinephrin, Nicotin, etc—The point of action of a number of drugs can be defined pretty accurately epinephrin produces its effects by an action on the myoneural junctions of the true sympathetic nerves and nicotin probably produces its effects on the bladder by an action on the ganglia along the course of the nerves going to the organ although this is not certain, as the experiments described by Edmunds and Roth show that there is, in addition to the action on the ganglia also a direct effect on the muscle Morphin and probably the pilocarpin-atropin series, including curara act along the course of the parasympathetics at a point about which there is still discussion as to whether it is nerve end or myoneural junction Or, it may be that the contractile substance proper is affected and the points of attack may not be the same in all organs and localities

Action of Pilocarpin, etc, on Retractor Penis—The action of pilocarpin physostigmin atropin and nicotin on the retractor penis muscle of the dog is a direct one on the muscle proper and there is nothing to indicate that the same may not hold good for their action on the bladder with the possible exception of nicotin which may also act on the ganglia along the course of the nerves going to that organ In the case of other organs and structures such as the iris bronchial muscles uterus etc, the same general rule will not hold as the action may be one on nerve endings or on myoneural junctions or on the muscle substance proper It is, therefore, dangerous to speak of these alkaloids as being stimulants of the parasympathetic nerve endings' or of the "myoneural junctions'

Traumatic Aneurysm of Subclavian Artery—A case of traumatic aneurysm of the subclavian artery associated with a concurrent brachial monoplegia was treated by ligature of the first portion of the subclavian trunk and vertebral artery. Relief from great suffering and pain followed the application of the ligature. The patient's general condition improved rapidly, and active motion in the shoulder became normal.

Surgery of Chest—Forty-nine patients have been treated by Moynihan by operation. Two patients died, one from hemorrhage following the removal of a projectile from the root of the lung and one from sepsis after the removal of an infected foreign body and a piece of clothing. Twenty-four patients are in perfect health and are able to do heavy work. Fourteen are better than before operation but still have some shortness of breath, or unusual respiratory trouble when having a cold or in bad weather. Two patients died, three are unable to do any work or have serious respiratory trouble, shortness of breath, cough etc. All but five patients were operated on by the ordinary anterior method. The five operated on by direct attack from behind show four with good ultimate results, one with fair result. Eighteen of the foreign bodies were examined bacteriologically, eleven were infected with *Staphylococcus aureus* or *Streptococcus brevis* in equal numbers or by these organisms together with coli form bacilli; seven were sterile. Empyema after operation developed in five cases, and in each of these, when the foreign body was examined it was found to be infected. Of the seven which did not suppurate only once was the foreign body examined, and it was sterile.

Oriental Sore Resembles Epithelioma—The excised skin lesions of the type of Oriental sore sometimes called Baghdad boil, Delhi sore, etc., examined by Macadam mostly showed the characters of a chronic ulcer, those of greater chronicity having some epithelial downgrowth at the margin, but in two instances the histologic characters were such as to be practically indistinguishable from a squamous celled carcinoma.

Intussusception During Typhoid—The temperature of the patient whose case is cited by Moreton had been raised although not typical but rather of the remittent type until the forty-seventh day of the disease. On that morning the temperature fell suddenly to 97.8 F. and the patient had a severe attack of vomiting. Although the signs characteristic of perforation were absent it seemed the most probable cause of her condition notwithstanding. Other possibilities were that the case was one in which a slow leakage had taken place and the leak had been shut off by adhesions, or that it was a case of localized peritonitis without macroscopic perforation. The abdomen was opened a mass was felt in the ileocecal region. This was found to be an enteric intussusception which had become enterocolic. Its apex was at a point of the ileum 5 inches from the ileocecal valve. This had become invaginated into and had extended 4 inches up the lumen of, the ascending colon. The ileocecal valve was not invaginated so that the intussusception was of the sub division iliaca-ileo-colica.' The intussusception was reduced without difficulty. No perforation was found. The patient lived. Ten other cases of this condition are mentioned in the literature.

Cyst of Common Bile Duct—Only thirty-five cases of this condition have been reported. The diagnosis has never been made before operation and the operative treatment has not yielded good results. In McConnell's case, the cyst extended from the extreme right side of the abdomen to a point some distance to the left of the middle line, and lay between the portæ, vena cava and right kidney behind, and the pancreas and duodenum in front. The cyst was aspirated. About one year later some leakage of bile took place at the original site of drainage. The original wound was opened and a large quantity of pus, mixed with bile, evacuated. Eighteen months later a third operation was performed. The cyst had shrunk to the size of a walnut, and occupied a position between the second stage of the duodenum and the right kidney. The patient made an uneventful recovery.

Avoiding Hemorrhage and Obstruction After Prostatectomy—In Walker's opinion prevention of these two complications lies in performing an open operation in which the bladder and prostatic cavity are fully exposed, the hemorrhage is treated, and all nodules and strips of tissue and valves are removed. The operation is described in detail.

Thigh Rotation or Obturator Test for Appendicitis—Cope says a diagnosis of appendicitis may be facilitated by bringing the obturator internus muscle into action, thus pain may be caused by the dragging of the contiguous inflamed tissues. The test is elicited as follows. The right thigh is slightly flexed (so as to relax the psoas muscle), the limb is then fully rotated at the hip first internally and then externally so as to put the obturator internus through a full range of movement. The sign is positive if the patient complains of hypogastric pain when the limb is moved in this manner.

Injury of Carpus—Wakeley's patient was thrown from his motorcycle and landed on his outstretched righ hand. He sustained a fracture of the styloid process of the radius, a fracture through the neck of the os magnum, dislocation of the scaphoid inward and dislocation of the semilunar forward with rotation on its transverse axis.

Causes of Valvular Heart Disease—Taking aortic regurgitation and mitral stenosis as the two typical valvular lesions which can be diagnosed with comparative certainty during life the results of this statistical inquiry have led to the following conclusions. The most important etiologic factor in the production of organic lesions of the heart valves in men between the ages of 18 and 41 is rheumatic fever. Strain can independently produce aortic regurgitation. While strain may be a cause of mitral stenosis it is a much less important factor than in the production of aortic regurgitation. There is a third agent giving rise to symptoms simulating influenza, which is an efficient cause of mitral stenosis and can possibly affect the aortic valves as well but is not nearly so likely to do so. The authors have been unable to find any statistical evidence that syphilis, scarlet fever, diphtheria, pneumonia or gonorrhea are causes of valvular lesions nor can we find statistical evidence that a history of growing pains points to affections productive of valvular lesions. The same may be said with slight reservations, of a history of rheumatism where there is no clear account of pain, swelling of the joints, fever, or confinement to bed. The evidence in favor of chorea as an efficient cause of mitral stenosis is strong, and some though not very striking evidence in confirmation of the view that chorea and rheumatic fever are both manifestations of the activity of a common cause has been found.

Psychoanalysis and Psychotherapy J Crichton Browne—p 1248

Vital Capacity Constants in Pulmonary Tuberculosis—A definite decrease in vital capacity as compared with what should be normal for any person, taking into account the class in which this person should be placed according to occupation and mode of life, Dreyer and Burrell claim is characteristic of pulmonary tuberculosis An improvement in the clinical condition of the patient is found to be accompanied by an increased vital capacity while an advance of the disease results in a decrease in vital capacity The vital capacity, therefore, gives a valuable quantitative measure of the benefit, if any, which the patient receives as a result of treatment The determination of the vital capacity is also useful for the classification of cases of pulmonary tuberculosis, because it is possible by this means numerically to express the injury to health (e g degree of toxemia) which otherwise would depend on the individual interpretation of physical signs by different observers In this connection it should be noted that classification by physical signs alone may place a patient nearing death from an acute lesion in a high category, while another patient, with satisfactory fibrosis and extensive cavitation, likely to live for several years, may be placed in the lowest category As an aid to diagnosis a single or repeated examination of the vital capacity of doubtful cases will also prove useful

Effect of Occupation and Race on Heart Disease—An analysis of 2,500 heart cases was made by Hall Of these 40 per cent had what is known as heart disease that is V D H (valvular disease of heart) or excessive myocardial change The illness of 50 per cent was due to want of tone and minor causes, nearly all quite curable if the people concerned had been in a good financial position In other words many of these will drift into invalidism and national inefficiency for want of a fair chance Another interesting feature is the proportion of dark to fair people who figure in this list Of the 2 500 heart cases the proportion of dark to fair was 3 to 2, and since among the other recruits examined there were two fair to every one dark heart trouble would appear to be three times as common among the dark elements As regards hyperthyroid action, the dark are affected in the proportion of ten to one The surprisingly high categories in which clerks were placed shows that this occupation need not be unhealthy, while the absolute ill health of the Russian Jews, as a whole and the close approximation of Jewish lads of 18 born abroad, but reared in Britain, to the British standard at the same age, proves there is nothing radically wrong with the physique of the Jewish race

Actinomycosis of Cecum—The case reported by Slesinger is unusual on account of the localized nature of the lesion and the onset with generalized peritonitis

Paratyphoid C—An organism corresponding in every way with Hirschfeld's organism was isolated by hemoculture in a case of continued fever in the course of routine blood culture for the diagnosis of puzzling pyrexias This was the only case of paratyphoid C found—a sporadic case, thus differing from cases found elsewhere

Etiology of Last Cholera Epidemic E T H Tsen—p 49

Abdominal Disease in Chinese—The average Chinese hospital, supposing it has the same bed capacity as the Massachusetts General Hospital, admits only one sixth as many abdominal cases, and sees less than one fifth as many laparotomies Appendicitis is a common disease among the Chinese In fact, excepting hernia, it is the most common abdominal condition which comes to the hospitals for treatment Liver cirrhosis and splenomegaly of various and often indeterminate etiology compose 17 per cent of all the abdominal cases seen in the Chinese hospitals

Ascaris Lumbricoides in Bile Passages—Tyau reports the case of a man admitted to the hospital complaining of pain in the epigastrium and general debility The pain began about three months before, and slowly got worse and worse It was a dull pain, occurring usually in the afternoon and after meals and lasting about three hours It was felt chiefly in the epigastrium and occasionally over the hepatic region, it did not radiate to the back or shoulder During the attack of pain nothing could be taken into the stomach The appetite was poor and the bowels irregular A nodular swelling about the size of an egg was palpable below the right costal margin which was slightly tender on deep palpation Laboratory findings Urine negative, gastric analysis showed hypochlorhydria, blood secondary anemia, feces showed many ova of ascaris and a few of trichuris After a course of santonin treatment about eighteen worms were passed with the feces But the patient did not improve There was no fever The patient died five days after the santonin treatment At the necropsy the liver was found to be much enlarged on the lateral and posterior aspects The gallbladder was greatly distended and the cystic duct was blocked by nine ascaris worms The liver contained numerous abscesses with copious pus, and in the bile ducts were embedded a number of young ascaris worms, some measuring only 1 25 inches long In the intestine fifteen ascaris worms all female and one trichuris was found Numerous eggs were found in the gallbladder and the liver Sections of the liver showed marked fibrosis with deposits of biliary pigments and degeneration of the cells

*Specific Complement Fixation Test for Bilharziasis W A Murray—p 168
*Ruptured Ectopic Gestation Combined with Pregnancy in Utero C C Elliott—p 169

Complement Fixation Test for Bilharziasis—The technic employed by Murray is based on a modification of the original Wassermann test, and the results have been satisfactory, although the number of tests actually performed has been small. Antigen obtained from the livers of snails (*Physopsis africana*) infected with the cercariae of *Schistosomo haematobium* was used. The livers are ground up in alcohol (1 gm. liver substance to 10 c.c. alcohol), the mixture is kept at room temperature for five days, with frequent shaking, is then filtered, and the alcoholic extract is used as antigen. For the test the antigen is mixed with 1 per cent. cholesterin (3 2), and is then titrated. The three antigens used so far have each given an anticomplementary titer of 1 3, and an antigenic titer of 1 80. A dilution of 1 8 is used in the actual test. The amboceptor, complement and sheep cells are used exactly as in the Wassermann test. Murray says that the presence or absence of bilharzial disease may be diagnosed with accuracy from the blood serum of any patient.

Simultaneous Ectopic and Uterine Pregnancy—In the case cited by C. C. Elliott, an attack of sudden severe abdominal pain led to the diagnosis of ruptured ulcer of the stomach. The woman was having her usual menstrual flow, and gave no history of missing a period. Elliott operated and found the right fallopian tube near its outer third, ruptured in what was an early pregnancy, possibly a month or six weeks. The uterus was somewhat enlarged, but Elliott did not consider this abnormal. The operation was done April 26, 1919. December 9 she gave birth to a full term child. Elliott concludes that there must, of course, have been a twin pregnancy—one fetus extra-uterine and one intra-uterine. The pregnancy probably began early in March.

*Precancerous Condition. G. Darier.—p. 464
Lethargic Encephalitis. L. Bernard and others.—pp. 470, 474

Precancerous Condition.—Darier refers to the chronic atypical epithelial proliferation described by Bowen and urges that all the patches should be thoroughly excised as cancer is almost certain to develop in them. This dermatosis resembles in many respects Paget's disease of the nipple which likewise, is usually followed by cancer. The dystrophy or dyskeratosis closely resembles epithelial masses in the cancers, which should be borne in mind in cancer research.

Influence of Liver on Sero-Agglutination. Duhamel and Thieulin.—p. 492

Resection of Posterior Arc of First Ribs.—Boeckel for twenty years has operated on high empyema from the back by severing the rhomboideus and the serratus magnus through a longitudinal incision in the trapezius, the incision in the skin curving around the posterior margin of the scapula. When these muscles are severed the scapula can be easily pushed over toward the axilla, giving ample access to the posterior arc of the upper five ribs.

Ipecac for Infants' Digestive Disturbances.—Saint-Philippe gives systematically minute doses of tincture of ipecac to bottle-fed babies with digestive disturbances. He gives it by drops in progressive doses, aiming to act on the digestive juices, and on fermentation and putrefaction. The ipecac, he says, tones up the liver and secretion of bile.

May 19, 1920, 34, No. 26

Bronchitis of Nasal Origin. H. Flurin.—p. 455

Hemorrhagic Erosions in the Anal Canal.—Durand comments on the difficulty of diagnosing these erosions, which may be the source of severe hemorrhage and yet escape inspection, hidden in crevices, unless the proctoscope is used. This is advisable also to exclude cancer above. The erosions in question are capillary hemorrhoids, without visible dilatation of the vein. They should be touched with 1 per thousand silver nitrate or 1 per cent. chromic acid two or three times, at two or three days' intervals, supplementing this by introducing a "gauze suppository" or roll of gauze coated with petrolatum medicated with zinc oxid, ichthyol or similar substance. This local dressing is renewed daily and the stools are kept soft. In the majority of cases this has always cured the erosions and thus the hemorrhages in two weeks. If not, the persistence of the hemorrhages justifies resection of the mucosa involved, but a trial might be made of the high frequency current.

Impaired Permeability of the Kidneys.—Genevrier warns the general practitioner that determination of the elimination of water, of chlorid and of nitrogen by the kidneys has no practical value unless the intake of each for three or four days beforehand is known and the amount of urine voided for three or four days previously. The permeability for water is easily shown by the induced polyuria test, drinking 500 gm. water fasting and comparing the amount of urine voided during the two following hours with the amount on corresponding days before. The permeability for chlorids can be determined by the loss of weight when the intake of salt is restricted and the gain in weight when salt is allowed again. The urea content of the urine throws very little light on the permeability of the kidneys for urea. For this, the urea content of the blood is the criterion, and he describes the simple means with which this can be ascertained with the ureameter after treating the serum with sodium hypobromite and phenolphthalein.

*Alcohol in Cerebrospinal Fluid. E. Lenoble and others.—p. 465
Chloral in Idem. Idem.—p. 476
*Erythema Nodosum and Tuberculosis. A. Gendron.—p. 475

Meningococcus Septicemia.—The protracted meningococcus septicemia had no meningitis and no benefit was apparent from serotherapy but the woman of 32 showed a prompt turn for the better after a single intravenous injection of a stock vaccine containing 1 mg. of meningococcus C per c.c., and recovery progressed under three more injections. The pseudorheumatismal fever, arthralgias and papulonodular erythema might have been mistaken for gonorrhea if it had not been for cultivation of the germs from the blood on egg bouillon and ascites bouillon.

Vaccine Therapy of Typhus.—Monziols and Collignon report favorable experiences with a vaccine made from Proteus X_{19}.

Alcohol in the Cerebrospinal Fluid.—Lenoble states in this seventh report of his research on this subject that the presence of alcohol in the cerebrospinal fluid has pathologic significance only when it persists for more than twenty-four hours. It does not persist in this way unless the individual tolerance for alcohol has been surpassed. This threshold differs with different persons, but is never lower than 250 c.c. of absolute alcohol. The alcohol content of the fluid is of less import than its persistence, this was for eighteen days, seventeen days, seven days in experiences related by different writers. Nicloux's quantitative test is accurate enough, he says.

Chloral and Chloroform in Cerebrospinal Fluid.—Ingestion of chloral induced a positive reaction to the Nicloux test for alcohol in the cerebrospinal fluid. Chloroform did not induce the reaction.

Erythema Nodosum in the Tuberculous.—Gendron remarks that the three cases of erythema nodosum and one of a miliary eruption in different members of a tuberculous family in his practice, confirm the connection between these conditions and tuberculosis.

*Coagulation of Spinal Fluid M Villaret and others —p 403
Immediate Treatment of Wounds of Bladder H Costantini —p 407
*Chart for Ambard Ureosecretory Index Mazeres —p 409

Diabetes from Syphilis of the Pancreas—Carnot and Harvier summarize from the literature four cases in which diabetes developed in syphilitics, but necropsy showed only ordinary sclerosis of the pancreas In a case from their own experience, however, a woman of 53 had been presenting symptoms of diabetes and of neurosyphilis for about two years The pancreas was almost entirely transformed into a sclerogummatous mass They believe this to be the first case to be recorded of diabetes from unquestionable syphilitic lesions of the pancreas

Coagulating Spinal Fluid—Massive coagulation with xanthochromia and hyperalbuminosis distinguished the spinal fluid in two cases reported In one of them, by making the puncture at different heights it proved possible to locate and treat the lesion responsible for the anomaly

Chart for Ambard Formula—Mazeres gives a nomograph with which the calculations for the Ambard coefficient are dispensed with The values are determined by drawing a connecting line between figures in different columns

Presse Médicale, Paris

May 19 1920 **28** No 32

*Pneumococcus Infections in Infants P Nobecourt and others —p 313

Pneumococcus Infection in Infants—At the Paris Maternite during the last year all the infants and adults were systematically examined for pneumococci with 55 per cent positive results from 322 smears Type III was found in 133 cases and was responsible for most of the infections When a carrier of Type II had been admitted to the ward it appeared almost at once in the other women and infants in the ward, and a train of infectious processes in the upper air passages followed Isolation is especially important to guard infants against this contagion The infant should be taken away from its mother if the latter becomes affected and be brought to her only to be nursed, and she should wear a veil while nursing the child Screens and veils are not enough to protect an infant in the ward with others having the pneumococcus Contagion by the dust as well as by droplets is to be feared Antipneumococcus serum in treatment of pneumococcus pneumonia and pleurisy in infants and adults has made a very favorable impression especially in three infants of 2 4 and 5 months old Prophylactic vaccination has been tried too recently for a decisive judgment, but others have reported excellent experiences with it The data presented emphasize further the severity of pneumococcus infections in infants

Arsphenamin Responsible for Jaundice P Nicaud —p 322
Copper Sulphate for Cancer of Vagina and Cervix D Pamboukis and G Berry —p 324
*Pepsin for External Application L Chemisse —p 325

Reduction of Fractures—Baudet and Masmonteil expatiate on the perfect results obtained by stretching the limb in a long frame with pressure applied by turning a handle just as a patent corkscrew pulls the cork out of the bottle by pressure on the neck of the bottle A dynamometer is interposed between the foot and the turning handle and this allows the pressure to be graduated The reduction by this means is gentle but complete and it overcomes all tendency to muscular contraction If reduction is not soon complete it shows that interposed tissue is preventing and that operative intervention is imperative without further delay Another advantage of this frame method is that any practitioner can apply the frame alone, without assistance The article is illustrated

External Application of Pepsin-Hydrochloric Acid—Chemisse reviews recent literature on the method of treating vicious scars, torpid ulcers and keloid and to promote absorption of drugs through the skin, by digesting the tissues with a mixture of 2 parts pepsin and 1 each of hydrochloric acid and phenol in 200 parts distilled water

Lethargic Encephalitis O Busse —p 368
*Depilatories L Merian —p 369
Perforation from Cancerous Stenosis of Colon W Odermatt —p 373

Physiology and Pathology of the Ovaries—Labhardt's long presentation of his subject aims to show the predominant importance of the ovaries not only for the genital system but for the whole organism Gynecology is receding more and more from the conception of localized pathologic conditions Instead of trying to treat the local process it is the woman as a whole that has to be treated

Depilatories—Merian lauds the pumice stone method of curing hypertrichosis He has recently seen a woman who had been relieved by this means twenty years ago of a very disfiguring growth of hair and the skin looks normal in both color and texture In very severe cases he prefers roentgen treatment and has thus treated twelve patients with no injurious by-effects For the pumice stone method he has the region rubbed first for from two to ten minutes with a strong soap leaving the lather on for from five to fifteen minutes It is then washed off the region dried and the skin is then rubbed gently with a fine piece of pumice stone twisting it a little while the skin is drawn taut with the fingers of the other hand Then the skin is treated with a cooling salve This is repeated the next evening with another part of the skin and so on each part receiving the application in turn once in eight or ten days Or the region can be rubbed with the finger dipped in pulverized pumice stone The use of pumice stone for this purpose is mentioned in the Talmud

Influence of Diet on the Water Content of the Body—Isenschmid remarks that it is hard to conceive that aside from the skeleton three fourths or four fifths of this body with which we digest and think consists of nothing but water Drinking of water does not modify the water content of the body Its direct dependence on the diet has been emphasized anew by the undernutrition edema reported from various points during the war It could be cured by giving a more nutritious diet or by repose without change of diet the repose restoring the balance between the intake and the expenditure of energy In some cases the edema subsided under merely moving the patients from a cold room to a warm room There is no need for organotherapy although the success of some with thyroid and testicle extract is interesting

The lack of milk in certain countries during the war prevented the Karell treatment of heart disease and led to the use of substitutes which he says surpassed the effect of the original Karell method in many cases Brilliant results have been obtained by some physicians with it Only 1 liter of water or fruit juice is allowed for the beverage and 1 kg of potato cooked without salt is taken during the day in five portions A banana cure has also proved effectual taken in the same way These and the Karell cure are poor in salt, and the small portions and absence of metabolic waste and small intake of fluid make very little demands on the digestive system and kidneys The potassium in the potato is another favorable factor Isenschmid's own experience testifies that restriction of albumin and of fluid and of salt is more effectual in the dropsy of heart disease than restriction of salt alone One patient with extreme edema rebellious to the Karell cure plus digitalis lost in eleven days

16 kg water on a diet of 5/4 liter milk, 200 gm bread, butter, and two or three eggs In some cases it is better to reduce the intake of fluids to 800 c c The edema following dysentery and other protracted wasting infectious diseases is usually ascribed to weakness of the heart, but it is more probable that it is of the starvation edema type Other known factors may be concerned, but to date, a diet conforming to the above principles seems to offer the best prospects for the cure of edema

Renal Calculi A Pulido Martin —p 244 Concld in No 3461 p 267

Pancreatic Infantilism—De los Terreros refers to backward growth from insufficiency of the pancreas The literature records few instances of this, but he has encountered it in a number of children The pancreatic insufficiency does not entail diabetes in children, although certain features of the metabolism resemble those of diabetes in adults, and transient alimentary glycosuria is common in children His experience has convinced him that the pancreas probably has three hormones one serving for carbohydrate metabolism, one for the interglandular control of growth and development, the third forms the active element in the pancreatic juice In children insufficiency of the two last mentioned hormones will check normal digestion and also check normal growth while the carbohydrate metabolism may proceed normally or with only minimal glycosuria and acetonuria A child with pancreatic insufficiency begins to lose weight, acetone and preacetonic bodies are thrown off in the urine and the thyroid, freed from the pancreas hormone, functions to excess There is usually a tendency to adenoids, pathologic tonsils, mononucleosis and often leukopenia, the resisting powers are low and the children contract disease easily

A Simplification of Kjeldahl's Method, Especially for Estimation of Residual Nitrogen—Hahn describes in detail his modification of the Kjeldahl method for the estimation of nitrogen which is far simpler and takes much less time than the original method

Potassium Permanganate in Examination of Urine and Sputum.—Weisz states that he has found still further uses for potassium permanganate in examination of urine He says that the test for urochromogen proved particularly valuable during the war, and he describes another potassium permanganate test, which differentiates uric acid precipitates from phosphates or albumin He also gives his method of contrast staining of sputum by means of potassium permanganate in examination for tubercle bacilli, which shows them up exceptionally clearly The urochromogen test can be used as well for detection of bilirubin the diluted urine becoming decolored when the 1 per cent. solution of the permanganate is added instead of the yellow tint with urochromogen These two substances are so rarely associated that the findings do not conflict. Uric acid causing turbidity in urine is rapidly destroyed on addition of the 1 per cent solution of the permanganate This differentiates turbidity from uric acid in urine or any fluid, with or without preceding treatment with acetic acid The uric acid disappears and the fluid becomes clear on addition of the permanganate

Death Late After Skull Injuries—Weise summarizes several cases to show that skull injuries are always to be regarded as serious and that the prognosis remains uncertain for several years Even two or three years later, frequently, and often quite suddenly while the patients are subjectively well, meningitis, encephalitis or brain abscess, or a combination of these, may develop and end fatally

Medical Treatment of Duodenal Ulcer—Mendel states that in all cases of duodenal ulcer, just to the right of the linea alba, slightly below the midline between the costal arch and the umbilicus there is a tender spot, usually the size of a 50 cent piece or possibly a little larger which is painful on the slightest percussion, whereas just outside of this area even sharp blows cause no pain This tender spot grows smaller as the ulcer heals and decreases in size, and it disappears when the ulcer is cured The reason internal therapy so often fails is that it is not begun promptly Mendel has successfully treated considerably over 100 cases of duodenal ulcer during the past twenty years with no recurrence in the overwhelming majority He demands absolute rest in bed for from four to six weeks, even in mild cases and advises the constant and intensive use of hot moist compresses At night a Priessnitz compress is ordered The patient is restricted at first to a milk diet When the spontaneous pains have decreased and the tender spot as shown by percussion has grown smaller, the diet may be extended so as to include zwieback, potato soup (the potatoes to be passed through a sieve), and finally mashed potatoes, with plenty of butter Rest and diet are the main factors in the treatment, while the moist heat serves to lessen the irritability of the gastric mucosa As a rule the chyme is hyperacid and irritates the surface of the ulcer and causes spastic contractions of the stomach To neutralize this hyperacidity, Mendel has used for twenty years the following prescription dried sodium sulphate 30 parts, dried sodium phosphate, 30 parts, sodium bicarbonate, 40 parts, one teaspoonful, dissolved in a wineglass of water, to be taken four times a day before meals He emphasizes the importance of the sodium phosphate in this treatment, as it has a regulating and sedative influence on the overexcitable vegetative nervous system which is an important factor in the vicious circle with duodenal ulcer

The Anatomic Forms of Pulmonary Tuberculosis A Schrumpf —p 407

Pathogenesis of Peptic Gastric Ulcer—On the basis of experimentation with rabbits Haeller has reached the conclusion that the ulcers produced in rabbits' stomachs by means of large doses of pilocarpin are not the result of muscle spasms However, he admits that if the essential preconditioning factors are already present, severe spastic contractions of the stomach may favor ulceration

Periesophageal Abscess from Foreign Body—Herzog emphasizes the danger of endeavoring to force a foreign body in the esophagus downward owing to the likelihood of damaging the wall of the esophagus as in the case reported He advises even against the swallowing of bulky food with

the idea of exerting pressure on the foreign body Such measures are likely to cause severe peristaltic movements and vomiting whereby points and jagged edges of the foreign body may be driven into the wall of the esophagus entailing perforation, or, if the body is pushed downward, it may cause new lesions in lower segments of the esophagus, so that in place of one injury a series of injuries may result Immobilization of the esophagus is indicated from the moment that the foreign body enters it Esophagoscopy should be resorted to at the earliest possible moment Codein and belladonna will render good service until the patient can be given a direct examination The subjective symptoms are often misleading There may be no pain in spite of the presence of a foreign body, then again severe pain may be present although the foreign body has already passed through the esophagus Esophagoscopy is therefore the only rational procedure, this does away with guess work and prepares the way for the proper therapy

Cineplastic Operations on Amputation Stumps—Sauerbruch and Stadler report that they now have a record of 1 500 cases in which tendon and muscle loops tunnels etc have been made in the stump to actuate artificial hands and 1 200 of the men have already been provided with prostheses Most of the men can lift weights up to 10 or 25 kg raising them for 3 or 5 cm A recent improvement is to take the skin flap to line the loops etc, from the abdominal wall It has been found possible also to utilize muscle power from the muscles of the chest The details of the cineplastics are described but without illustrations They say that the success that is being realized at the Munich and Singen centers for this work is converting the skeptical, and demonstrating the advantages of the artificial arm devised by Sauerbruch and especially what is called the Singen model

The Sachs-Georgi Test—Wodtke states that the sensitiveness of the Sachs Georgi precipitin reaction can be increased by the use of double the usual amount of serum Some serums however, react with the usual quantity of serum more sharply than with double the quantity By using both the usual and the double amount of serum, an increased number of positive results can be obtained without detracting from its diagnostic significance so far as Wodtke's experience extends, although some have feared such result By the use of several different extracts a higher degree of sensitiveness may be secured, besides cholesterin-fortified extract of beef heart cholesterinized extract of human heart may also be used

Comparison of Results with the Wassermann and the Sachs-Georgi Tests in Syphilis—Baumgartel reports that according to the observations of various authors in 25 000 parallel blood examinations and in 7,000 parallel tests of his own, the results by the Wassermann and the Sachs-Georgi reaction agree in about 90 per cent of the cases In using the Sachs-Georgi method he recommends that the reaction be taken solely at the incubator temperature The results should be noted not only after twenty-four hours but also after two and forty-eight hours' heating of the test tubes at 37 C In this manner a certain number of cases of syphilis that are atypical from a serologic standpoint will be discovered

Traumatic Emphysema from Foreign Body in Trachea—Herzog reports a case in which the first paroxysm of coughing that followed the entrance of the foreign body (a portion of a prune pit) in the trachea seemed to have brought about the traumatic injury of the lung tissue resulting in interstitial emphysema, which appears to be a very unusual occurrence The patient, a girl, 1 year old, died following tracheotomy

Internal Use of Iodin in Coryza and Tonsillitis—Finck gives a preliminary report of his experience with the prophylactic and therapeutic use of iodin in acute infectious conditions in the upper air passages The iodin does not suffice to kill the bacteria but seems to prevent their further development Either the nutrient medium is unfavorably affected for the growth of the bacteria or the iodin exerts a direct damaging effect on the bacteria themselves He uses iodin in a 10 per cent solution of potassium iodid (purified iodin 0 3 gm , potassium iodid, 3 gm , distilled water, 30 gm) For children up to 10 years of age the dose is 5 drops, for older children and adults, 8 drops, for stout or heavy-set persons 10 drops in a quarter of a glass of water, a half a glass of water to be drunk afterward For prophylactic purposes he prescribes one dose daily to be taken at the first signs of infection In some of the severe cases the prophylactic dose may not suffice in which case two therapeutic doses one two hours after breakfast and one before going to bed are recommended The dosage must never be increased as iodism with coryza would result Recovery should follow in from two to three days A single dose should then be continued for ten days

*Barbital As Adjuvant in Morphin Withdrawal Hornung —p 484
Important Source of Error in Testing Urine for Albumin with Sulphosalicylic Acid Grete Lach and J Reitstoetter —p 484

Physical Training in the Universities—Gruber discusses the need of more systematic physical training in German universities now that universal military training is a thing of the past While the youth of the land need to be well trained physically there is some danger of overdoing the matter and allowing sport to assume too much of a professional aspect of which there were signs even before the war

Committee Report on Mishaps with Salvarsan—Meirowsky, secretary of the committee appointed by the Allgemeiner aerztlicher Verein of Cologne publishes a report of its work In preparing the statistics on the number of deaths resulting from arsphenamin therapy 225 780 injections of arsphenamin, neo-arsphenamin and arsphenamin sodium were considered The number of deaths resulting totaled 20 one fatal case for every 11 289 injections 12 deaths were designated as certainly due to arsphenamin treatment 5 as questionable, and 3 as indirectly due to arsphenamin All deaths from encephalitis following arsphenamin treatment were set down by the commission as certainly due to arsphenamin On the basis of its investigations the commission recommends that the maximal dose for men be placed at 0 6 gm and for women at 0 45 gm It recommends further that manufacturers be prohibited from putting up larger single doses than these One instance of jaundice was recorded for each 5 000 injections one in 2 000 for old salvarsan and one in 6 000 for neosalvarsan With the latter it was generally tardy and it was most frequent in the tertiary stage Injury of the skin was recorded in 48 cases, including 5 that terminated fatally Of this number, 37 of the cases and 3 of the deaths must be attributed to the medication, as also the 15 cases of neurorecurrence

The Mastic Test—Schonfeld describes his modification of the Emanuel-Cutting mastic test to apply to the cerebrospinal fluid The findings coincide with those of the Wassermann reaction only when there are pronounced specific changes in the spinal fluid, such as are found in syphilis of the brain and in general paresis He says that the mastic reaction therefore cannot be considered as a substitute for the Wassermann reaction It is interesting from a theoretical standpoint but clinically its diagnostic value is no greater than that of the Pandy, Weichbrodt and other reactions

Barbital as an Adjuvant in Morphin Withdrawal—Hornung has found barbital useful in combating withdrawal symptoms in the treatment of morphin addicts and describes in detail his method of using it The advantage is that the patient is kept in a more cheerful frame of mind during treatment

*Intermittent Course of Gastric and Duodenal Ulcer E Schutz—p 336
Periodicity of the Symptoms of Gastric and Duodenal Ulcer F Mandl—p 337 Idem F Brunn and others—p 338

Pathology of Sore Throat—Fein says that the inflammatory process associated with sore throat is very rarely confined to any single part of the faucial ring, unilateral sore throat does not occur The entire system of lymphoid structures becomes affected all at once Contrary observations are due to wrong conceptions and to the fact that secondary factors attract the most attention He suggests the term "anginosis" in place of 'angina' as it marks better a general infection, such as sore throat undeniably is Infectious sore throat and the so-called complications in other parts of the body are simply manifestations of one and the same infection and are not to be regarded as cause and effect The phenomena observed can be explained only by assuming an endogenous infection by way of the blood or lymphatics Other things being equal, the intensity of the local inflammatory process depends on the size of the mass of tonsil substance The less substance there is, relatively, the less there is to become involved and the shorter will be the course of the inflammatory process

Effects of Carbid on Human Skin—As prophylactic measures for those who are handling carbid Sachs recommends that gloves be worn and that petrolatum be rubbed into the hands, following which they should be powdered with talcum

The Intermittent Course of Gastric and Duodenal Ulcer—Schütz regards the periodicity of the symptoms of duodenal ulcer as a characteristic feature of great value in its differential diagnosis The attacks in duodenal ulcer are not only periodic, but they occur mainly during the cold season, or at most during the spring and fall, whereas symptoms from gastric ulcer appear at irregular intervals The cause of this different behavior is not known The condition of the patient during the remission in the two disease processes varies widely, with duodenal ulcer the patients are often entirely free from subjective symptoms, whereas with gastric ulcer dyspeptic symptoms very frequently persist during the periods of remission This is one of the main reasons why formerly duodenal ulcer was often mistaken for a gastric neurosis The supposition is that gastric ulcer is more exposed during digestion to mechanical and chemical insults than is the duodenal ulcer

*Osteochondritis Deformans of the Hip Joint in the Young H Sundt—p 538 Idem H Waldenstrom (Stockholm)—p 539 Idem G Perthes—p 542
Compression of Commission Bile Duct by Retroduodenal Tumor Recovery after Removal of Tumor A Brentano—p 547

Osteochondritis Deformans of the Hip Joint in the Young—Sundt ascribes the priority in the description of this obscure affection of the hip joint to Legg and Calve and proposes to call it malum coxae Calve-Legg-Perthes Waldenstrom reproduces his published description of it a year before Legg's article Both writers protest against calling it osteochondritis as there is no inflammation Waldenstrom urges to call it 'coxa plana,' in analogy to coxa vara and coxa valga The special characteristic is the flattening of the head as weight bearing crushes it flatter when nutritional disturbance has interfered with its proper development This term, coxa plana leaves the question of the etiology untouched It can be supplemented by the descriptive terms, traumatic, tuberculous, hypothyroid, etc

Perthes on the other hand persists in advocating the name osteochondritis deformans juvenilis as this classes it with osteochondritis dissecans of the knee joint, both the result of nutritional disturbance from impeded circulation from some cause He cites a number of instances of its bilateral development which suggest that besides trauma more general disturbances may be involved in the etiology Several have observed a familial tendency, and he describes a case in which the hip joint affection was evidently an after-disturbance causally connected with an acute infectious disease acute febrile rheumatism in the girl of 8 The flattening of the head of the femur did not become evident until eight months later although the child began to limp a month after the febrile rheumatism Probably he remarks in conclusion a number of causes may be responsible for the obstruction of the superior artery of the neck of the femur (Legg has called the affection osteochondral trophopathy of the hip joint Among the articles on the subject published in THE JOURNAL were Freiberg's Aug 26 1916 p 658 and Blanchard's, Sept 29 1917 p 1060)

*Accessory Pancreas P Nieuwenhuijse—p 2106
Urethral Polyps G O E Lignac—p 2114
*Progressive Perichondritis J F O Huese—p 2120

Accessory Pancreas.—A supplementary pancreas is usually merely a necropsy surprise but it may entail clinical disturbances during life Scagliosi incriminates it as a factor in duodenal ulcer in certain cases He found aberrant pancreas tissue in the wall of two ulcers and de Jong found the same in the hypertrophied tissue of stenosis of the pylorus Hulst found an accessory pancreas in the wall of an intestinal diverticulum To date Nieuwenhuijse says there is no authentic instance of aberrant pancreas tissue being found in a malignant tumor In a personal case of which he gives illustrations the aberrant pancreas tissue formed a bunch under the mucosa of the stomach above the pylorus The macroscopic picture suggested cancer, but the microscope refuted this

Progressive Perichondritis—In Huese's case the inflammatory process was in the costal cartilages of the man of 53 It started with an abscess close to the perichondrium of the eleventh rib and soon involved the stomach wall and spread right and left and up and down, skipping the ribs the man dying of cachexia Only two analogous cases are on record, he says

April 3 1920 **1**, No 14

Action of Bile and Bile Salts on the Principal Digestive Ferments J Temminck Groll—p 1157
*The Calcium Level in the Blood Stheeman and Arntzenius—p 1168
*Extramembranous Pregnancy G C J Bol—p 1177

Importance of the Calcium Content of the Blood—Stheeman and Arntzenius state that the calcium content in the

blood may be high in rachitis and thus mask the actual calcium deficit in the tissues but the latter is disclosed by the Erb sign Whenever the motor nerves display excessive irritability in response to electric tests, there is calcium deficit, regardless of the calcium level in the blood at the moment It is evident, therefore, they say, that there is more than one kind of calcium in the blood a biologically efficient and a nonefficient kind one for growth and one for metabolic processes When phosphorus and cod liver oil are given the level of the calcium in the blood begins to rise in ordinary conditions but with rachitis the exact reverse occurs The calcium content of the blood declines as the calcium in the blood and from food is diverted to the bones The proportion of inactive calcium grows less and the level of total calcium in the blood falls Then gradually as conditions right themselves the calcium content of the blood rises anew This definite rise is constantly observed as the child throws off the rachitis and the Erb and the Chvostek signs are no longer apparent In the absence of both of these signs calcium impoverishment is scarcely probable In conclusion they reiterate the importance of estimation of the calcium content of the blood It is even more important than research on the calcium metabolism as the calcium balance does not indicate whether there is calcium impoverishment or calcium abundance The calcium content of the blood however combined with electric tests of the peripheral nerves permits continued oversight of conditions (See abstract of their preceding article July 3 p 71)

Extramembranous Pregnancy—Attempts to induce abortion at the third month were evidently responsible for the extramembranous development of the fetus It was delivered naturally at term but had multiple deformities and died soon after birth

Hospitalstidende, Copenhagen

Ultimate Outcome of Sanatorium Treatment J Ostenfeld—p 569 Cont'n
Pathologic Fluctuations in the Metabolism During Repose Marie Krogh—p 577 Begun in No 17 p 537

Fluctuations in Metabolism During Repose—Krogh reports extensive study of the influence of the thyroid gland on the metabolism its exaggeration in exophthalmic goiter and hyperthyroidism in general and its reduction in myxedema and cretinism With exophthalmic goiter this increased metabolism should rank beside the three cardinal symptoms of the disease and in the absence of the latter will clinch the diagnosis in dubious cases testifying to the pathologically increased production of thyroidin She tabulates the findings in thirty-four cases under eleven headings, including the respiratory quotient, gaseous interchanges and absorption of oxygen per kilo and minute and square meter of surface but emphasizes that the absorption of oxygen is the main criterion This will differentiate in dubious cases myxedema from adiposity will reveal incipient exophthalmic goiter, and allow supervision of the progress under treatment In a communication in No 19, Nordentoft protests that exaggeration of the metabolism cannot be accepted as the criterion for the differential diagnosis of hyperthyroidism until we find out what influence hyperthymism has on the metabolism

May 13 1920 82, No 20

*Chronic Multiple Arthritis H Jansen—p 627 Concd No 21 p 655
Outcome of Sanatorium Treatment of Tuberculosis J Ostenfeld. —p 636 Conc'n

Chronic Multiple Arthritis—Jansen classifies chronic arthritis according as rheumatism traumatic static and senile causes are responsible, the secondary uric acid polyarthritis and the primary chronic progressive form which is known variously as multiple arthritis deformans, primary asthenic gout arthritis nodosa and rheumatoid arthritis His experience with 333 cases, exclusive of the traumatic and static forms has demonstrated that with physical measures heat diathermy massage light baths, hot sand bags etc., if the patient takes hold with energy and perseverance, far more can be accomplished in treatment than is generally supposed possible The aim is to heat the joints, not to induce sweating The joint is moved in the water or light bath, and in order to allow this exercising of the joints the bath tub is made extra large and the patient sits on a stool in the water, the heat permitting great mobility in these kinetotherapeutic baths as he calls them It has been his experience that diathermy and roentgen treatment did not accomplish any more than ordinary physical measures and sometimes less But radium emanations have proved extremely useful in treatment of chronic polyarthritis both in his hands and in Falta's experience in Vienna Jansen warns against keeping polyarthritis patients too long in bed, the active mobilizing exercises should be begun even before they are able to get up He adds that it is a sin to put them in cotton clothing as is done often in hospitals Their peripheral circulation is poor and they need woolen and the rooms should be dry To encourage the patient is an important element

The Journal of the American Medical Association

Published Under the Auspices of the Board of Trustees

VOL 75, NO 3 CHICAGO, ILLINOIS JULY 17, 1920

THE RIGHTS OF THE CHILD*

JAMES A HAYNE MD
COLUMBIA S C

The triumphs of internal medicine and surgery in the last half century have been marvelous, and suffering humanity has been greatly benefited Many obscure cases of disease have been patiently studied out, and the proper remedies applied By new methods of diagnosis and the use of instruments of precision, a secure foundation has been laid, and medicine is no longer guesswork and empiricism it has become a definite science Cause and effect have been studied, and rational procedures discovered to assist nature in restoring pathologic conditions to normal

Specialism is now the order of the day Almost every day sees a new variety of specialist born If the specialist has built his knowledge of a specialty on the secure foundation of an intimate knowledge of the human body in sickness and in health, and has not been led astray by the ignis fatuus of belief that all human ills may be cured by remedying the conditions found to exist in the particular organ or organs that he has chosen for his attention, but regards the human body as a wonderful mechanism with every organ depending on the proper functioning of all organs, then the practice of a specialty is of the greatest benefit to humanity, for it is admitted to be impossible for one brain to know all the minutiæ necessary for the treatment of each individual organ that may not be properly functioning

Preventive medicine should rank as a specialty, and the health officer or preventive disease specialist should be recognized as authority on his chosen branch, and he should confine himself as do other specialists to the things pertaining to the prevention of diseases To be a preventive disease specialist, however, he should have had all the training in diagnosis and treatment of disease that makes a first class general practitioner Having acquired this knowledge and in addition studied and mastered the problems of public health, he may then offer his services to the public as a specialist in matters pertaining to preventive medicine Having perfected this specialty, he should no longer practice curative medicine

The opportunities now offered in this branch of the profession for trained men are many and lucrative, and we must impress on the profession as well as on the public that because a man has the degree of M D he is not necessarily a health officer The public is recognizing these facts, and if the physician is to retain his position as a leader in the fight to prevent disease he must accept the public verdict and recognize the preventive disease specialist, just as he does the ophthalmologist the aurist the pediatrician, the urologist and the specialist in diseases of the stomach or any of the other specialists

Unfortunately little time is now given in the medical schools to the teaching of preventive medicine The student is trained in the diagnosis and treatment of diseases looking toward a cure, and his mind is directed solely toward curing the ills to which flesh is heir, having but little idea about how these diseases could be prevented The awakening to these facts is shown in many medical centers and doctors of public health will soon be not as rare as they are at the present time

PREVENTION OF GREATEST NUMBER OF DEATHS

Our vital statistics reveal that more than 33⅓ per cent of all our deaths are of children under 5 years of age It is in this branch of preventive medicine that the greatest progress can be made

Death will overtake all of us sooner or later, but we should be able to keep from his cold grasp the infant and tender child The spectacle of Rachel weeping for her children, and refusing to be comforted because they are not, would not be so often seen if we would make a proper study of what I have termed the rights of the child, and attend to securing these rights for all children

This subject is timely because the world is just emerging from the gloom of the death struggle for human rights, and the nations are taking stock of their assets War pestilence and famine have ravaged the nations of the world Money has lost its value ancient thrones have crumbled and fallen, statesmen and philosophers of all nations have turned their eyes to the child as the savior of the world One supreme fact is acknowledged by all—that their greatest asset is the child Thinkers the world over are giving their attention to the problem of increasing the number of children and making the world safe for them

If we read aright the lesson of the war to this country through the findings of the draft boards, it must be impressed on us that we have wasted our birthright, have ignored some of the fundamental rights of the child, and as a consequence, when our government was called on for its man power, it did not have that man power which its population indicated

The rights of man have gradually emerged from slavery to freedom Runnymede the 15th of June 1215, when King John signed Magna Carta, the eloquence of Rousseau Voltaire, the fiery baptism of the

* Chairman's address read before the Section on Preventive Medicine and Public Health at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

French Revolution, and our own Declaration of Independence have given to man the inalienable rights to life, liberty and the pursuit of happiness Now, no one disputes that rank is but the guinea stamp—"A man's a man for a' that" "Honor and fame from no condition rise Act well your part, there all the honor lies"

The rights of woman, too, have been slowly achieved, from the time of Mary Wollstonecraft of England, who first wrote the foundation of the rights of woman, down through Susan B Anthony, Emeline Pankhurst and the militant suffragettes of England who burned the English country homes heckled the prime minister, to the women who picketed our own President in Washington, and by general waving of the yellow flag at last achieved their aims The ballot is now in the hands of the women, and with it they have gained all their rights, both real and imaginary

But, what of the child? Who has championed its rights? Summoned against its will and without its consent into this world of trouble, pain, sickness and finally death, what Rousseau or Voltaire shall sound the tocsin and call on the infant "mewling and puking in the nurse's arms," to demand that its own mother shall give it the lactic fluid that is its primal right Bid it howl like all the heads of Cerberus against being condemned to partake of milk of cerulean hue contaminated by Bulgarian bacillus prescribed by some adolescent and ardent disciple of Esculapius What Danton or Robespierre shall band together the sansculotte toddlers so that they may not be torn from the kindly face of mother earth, washed and dressed and sent to kindergarten, where all of their play is so scientifically arranged by followers of Pestalozzi and Froebel that good fairies are unknown to them, and, to paraphrase Wordsworth, a primrose beside a mossy bank is to them but a primrose, nothing more, where they are taught like the clown in Mrs Browning's poem to pick simples, turning a broad back to the glory of the stars Who shall demand for them the right to believe in fairies, the right to sunshine and to flowers, to the fresh air, and to green fields, to all that makes up the paradise of childhood Who will lead another Children's Crusade for these, their ancient rights?

BIRTHRIGHT OF THE CHILD

The rights of the child named in the order of their sequence, and order of importance, may perhaps be thus arranged

1 The right to be conceived Strange as it may seem, this right has been more successfully denied to the child than perhaps any other of its rights Malthus wrote and taught that in order for a country to be prosperous, the number of babies must be in ratio to the amount of food produced This, of course, implied birth regulation Napoleon, on the other hand, when asked by Madame de Stael who was the greatest living woman of France, replied, to her chagrin, "Madame she who has borne the most sons for France" Here we have the opposite poles of thought In this country we have not lacked apostles for both creeds Our own Roosevelt's slogan was more babies and better babies, and he fought the then growing tendency of the American family under modern conditions to consist of a human parasite, called a wife, and an idolized poodle dog To the transcendentalist who believes that all souls are drawn from the Over Soul, and enter the material body but to perfect themselves by the trials and tribulations of this world and, after blind effort to reach the light, finally return to the Over Soul perfected by these struggles for higher things, the denial of the right to be conceived and born is to deny the whole scheme of the universe, is a sin against nature, and therefore unpardonable

2 The right to be born after conception Few will be found to advocate openly the converse of this proposition But our birth registry, and the enormous number of miscarriages and abortions which occur will show that, in practice, many, far too many, deny the child this right We medical men must be ever on the watch to prevent and expose these violations of the law of God and man

3 The right that its parents shall be healthy, both mentally and physically, in order that the child shall not enter the race of life handicapped by transmitted disease or mental weakness

The problem of eugenics, as first advocated by Galton in 1884, has had many followers In 1904, Galton endowed a chair in the University of London for the purpose of the study of agencies under social control that may improve or impair racial qualities of future generations either physically or mentally Galton's work has been elaborated and laws have been passed in many states to endeavor to safeguard the child in this right

By law in many states certificates of physical fitness for marriage have been required of both contracting parties While we concede that this is a step in the right direction, much study is yet necessary before we pass arbitrary laws, for a physically perfect man and woman may never produce a Shakespeare, a Raphael or a Beethoven and some of the greatest additions to human knowledge and happiness have come from those whose earthly shell was misshapen, for the body must always be regarded as the stringed instrument on which the soul plays wondrous chords, and this would be a dreary world, indeed, without poetry, music and art

One of the best examples of the way in which eugenics has been carried out was recently given by the English nobility, in whom for centuries has been inculcated the idea that an English gentleman is the finest work of God The answer came at Mons, where the flower of the English nobility laid down their lives gallantly fighting with their faces to the foe, for the rights of democracy

4 The right that its mother shall be so cared for by the state that neither through poverty nor ignorance shall she bring it into the world in unhygienic surroundings, nor under superintendence of those who are not properly trained to give the most skilful treatment to the mother in this her time of supreme helplessness and agony This means that maternity hospitals must be maintained in the city, and that in the rural districts trained medical men and skilled nurses must be easily available

5 The right to have its own mother's milk until it is old enough to be weaned This we regard, perhaps, as the most important right, and the one most frequently denied In the rich it is denied because some complaisant boudoir physician agrees with the mother who desires to be rid of the burden of nursing—that her milk does not suit the child, that she does not give sufficient quantity, that it will injure her figure that it is best for the child not to nurse, and that it disfigures the tender mouth of the child and makes it misshapen

All of these arguments you and I have heard In the poor it is denied because grinding poverty prevents the mother from giving the time necessary for nursing her little ones The state should provide that no mother should have to labor so hard that she is unable to nurse her baby Pensions for mothers are given in England before and after the birth of the child, and there is no expenditure of money a state can make that will pay better dividends than the care of the mother and babe Old Jacobi, that Nestor of medical men, said after years of experience that a woman who could have a baby could in 90 per cent of the cases nurse it But nature takes her revenge In the rich she makes the mother strive by seeking new pleasures every day and excitement of all varieties, to forget the pressure on her breast of little hands, and the dewy mouth of the babe which she has robbed of its birthright In the poor, the mother, instead of having an infant every two years, has one every year, for normal conception does not take place before the child is weaned and the poor do not understand all the arts of preventing conception known to the rich

6 The right, guaranteed by the state, that every baby born shall have an equal chance with other babies to develop into the normal, healthy child This is the problem of the health officer that the child shall not have to suffer from the ill effects of communicable diseases, that measles, whooping cough and diphtheria shall no longer be called children's diseases, that the tender babe shall be cared for by all the power of the state, as it lives its happy life and grows in wisdom and stature This also includes medical inspection and correction of defects

7 The right that, when it reaches school age, it shall have the best that the resources of any government can command It should have properly ventilated schools, carefully lighted and heated with the most approved methods of sanitation, and if a proper diet cannot be provided in the homes of the poor, such diet should be provided in the schoolroom so that its budding mind may be trained that it may attain to industrious, sober and healthy citizenship and take its place in the ranks of producers and be a real asset to the government that has cared for it This is the remedy for bolshevism These methods will stamp out the unrest of the world, and if the rights I have tried to indicate are given the child, the future of the race is assured

---

Mental Hygiene of the Child—Those concerned with the welfare of children should ever bear in mind that the impulsiveness and everchanging activity of a number of so-called fidgety children are but symptoms of mental fatigue, says W L Treadway (*Am Child Hyg J Tr* Nov 11-13 1919) Normal children are active impulsive and inquisitive This is nature's method of education and children, therefore should be allowed to exercise these mental traits Rigid discipline tends to curb natural activities, which then seek outlets in other more or less roundabout ways For example, too rigid discipline tends to cause the harboring of resentment against and disregard for those in authority When once discipline is relaxed the child having failed to learn to control his impulses frequently finds himself in difficult and compromising situations Disciplinary measures should follow the form of substituting desirable activities for undesirable ones To do this effectively those responsible for the welfare of the child besides having an understanding of personality, should be able by tact to secure attention and discipline without apparent effort and without the knowledge of the child This is especially important when the impulsiveness and activity of the child are so marked as to attract attention

THE TREATMENT OF OBSTINATE OCCIPITOPOSTERIOR POSITIONS

JOSEPH B DE LEE, M D
CHICAGO

I make no apology for presenting such an old time-worn and familiar subject My reasons for doing so are (1) In spite of all that has been said and written about this particular anomaly of mechanism of labor, it is one of the most frequently overlooked, (2) it still is responsible for—I may say without fear of contradiction—thousands of infant deaths each year, and for many maternal deaths, (3) the condition itself and the operations performed because of it cause untold and untellable maternal and infant suffering—the children's brains are damaged the mothers' soft parts lacerated and destroyed (4) I have a new and simple method of treatment

The vast majority of cases of occipitoposterior positions will if given time enough rotate spontaneously and terminate as occipito-anteriors The majority of these will do so speedily, and with no danger to either mother or child A part, however, rotates so slowly and labor drags on so long, that both the mother and the child are harmed The child particularly suffers from cerebral compression and disturbances due to a mild chronic asphyxia Even though finally born alive, it frequently succumbs to the effects of the delay, cerebral hemorrhage or atelectasis pulmonum For the mother, both morbidity and mortality are higher because of exhaustion and infection from the prolongation of labor and the frequently needful operations with the inevitable lacerations The word obstinate is therefore applied to those occipitoposterior positions that remain such, in spite of prolonged powerful pains, or when the length of the labor because of weak pains, in itself, becomes an element of danger

The most important matter in cases of abnormal rotation is their recognition The fact that the occiput is not diagnosed as posterior, but considered to be anterior, or, indeed, not considered at all, is responsible for most of the fetal deaths and maternal injury

The character of the labor often gives a strong hint as to the cause of the trouble A long first stage, weak, irregular ineffective pains, slow effacement and dilatation of the cervix, premature rupture of the bag of waters, head persistently high above the inlet—these usually accompany occiput posteriors On examination, especially in thin women a glance at the abdomen may suffice—there is a distinct hollow above the pubis The occiput is too deep in the flank to be felt, but the forehead often projects over the flank The shoulder is not in front as usual It, too, is far in the flank The heart tones are heard [illegible] back, unless as not seldom happens the head is a little and the chest is thrown out against the uterine wall The heart tones are then on the same side as that of the forehead, opposite the back, and therefore we are likely to be misled in diagnosis of face presentation or of presentation opposite that of the reality e g, breech presentation may impress one as a [illegible]

On vaginal or rectal examination in labor, that the head is very [illegible] some deflexion This brings [illegible]

nearer the middle axis of the pelvis and better within reach of the examining finger The small fontanel is found to the right or left, behind the transverse diameter As labor advances, usually the head flexes, and the small fontanel sinks, comes into the transverse diameter, then anterior to it It is important for the accoucheur to know whether nature intends to effect this mechanism He awaits a pain and palpates the head carefully during its action If the small fontanel makes or tends to make the movement just mentioned, he may feel reasonably sure of spontaneous anterior rotation and an easy delivery This he may also assume if the head rotates properly in the right direction under light pressure by his finger

If posterior rotation is to be the mechanism intended by nature, the head descends in moderate deflection, often in the transverse diameter of the pelvis, and the occiput after engagement is found in the hollow of the sacrum The small fontanel may be easily felt, either rectally or vaginally, near one sacroiliac joint, the large fontanel is behind the pubis, the sagittal suture lying in one oblique or sometimes directly anteroposteriorly

Nature terminates these cases in one of four ways (1) Under strong pains, even late, anterior rotation of the occiput occurs and the labor ends as usual, (2) rotation takes place partially and the head remains transversely until art steps in and extricates the child from its precarious condition, (3) if conditions are favorable, the head is born in this position, the occiput escaping from under one ramus pubis, the chin appearing under the other, (4) the occiput having rotated into the hollow of the sacrum (occipitosacral), delivery may occur in two ways (*a*) Flexion takes place, the root of the nose stems behind the pubis, and the occiput rolls over the perineum (more often it breaks through it), and (*b*) extension occurs, the forehead comes down and stems behind the pubis, and then the occiput comes out over the perineum, the mechanism resembling that of brow presentation In one of my cases complete extension, face presentation, occurred, the child coming out according to the usual face mechanism

Diagnostically we can determine which type of delivery will occur by searching for the large fontanel With flexion, this is high up behind the pubis, with extension, it is nearer the center of the pelvis In many instances the caput succedaneum covers up the sutures and fontanels, here one has an infallible guide, one that is not often enough consulted Search for the ear, the tragus always tells you where the face is

An essential part of the diagnosis is the discovery of the cause of the occiput being and persisting posterior, and of the contributing agents of the dystocia One may find a contracted pelvis, a fibroid, stenosis of the cervix or vagina, old primiparity with contraction rings in the uterus, a mammoth child, or some other condition which may require a cesarean section as a primary indication In consultation practice, one is often astonished to observe how this fundamental principle of obstetric diagnosis—a careful examination and consideration of all the factors necessary for judgment—is neglected

TREATMENT

In practice, one finds two classes of cases first, those in which the head is engaged, and second, when the head is in or above the inlet We occasionally meet one in which the head is arrested in the second parallel plane of Hodge, but we treat it as if the head were not engaged

When the head is high, floating, interference is not necessary, but a careful search should be made for any condition that may demand treatment for its own sake Watchful expectancy is the course to pursue Rupture of the membranes should be prevented, if possible, because labor is more often retarded than hastened by it The woman should lie on the side to which the occiput points, this is supposed to favor flexion, engagement and rotation Morphin and scopolamin are used in the first stage to prevent exhaustion of the mother and child, but it is not wise to let the labor drag on too much By means of a colpeurynter the dilatation of the cervix may be completed and the case thus prepared for interference if required After complete dilatation of the cervix, I usually wait an hour or two to see whether or not the head will engage If it does not, the membranes are punctured—the patient being on her side, to prevent prolapse of the cord If the head does not engage very soon, two courses of procedure are open version, followed by extraction if need be, and manual correction of the position In multiparas there is little choice, and individual preference may be exercised

Under deep anesthesia the whole hand is passed into the uterus, pushing the head up and out of the pelvis if necessary That hand is selected which will have its palm directed toward the face of the infant The posterior shoulder of the child is sought and with the tips of the fingers is swung around to the front, past the promontory of the sacrum The head, fitting into the palm of the hand, goes with the trunk When the inside hand is leading the occiput into the pelvis in its new position, the outside hand forces the head down by pressure on the occiput, which is now to be felt over the pubic ramus It may be advisable to draw the head down deep into the pelvis with forceps, await from four to six labor pains, remove the forceps, and leave the case to nature, or to follow a later indication The latter plan is especially successful in primiparas, because the molding of the head and the softening of the tissues produced by a few hours' labor and the progress of the head toward the outlet immensely facilitate the subsequent delivery In rare instances the manipulation fails because the child is held immovably in the anomalous position or because the cord prolapses, or the placenta may be in the lower uterine segment and compromised, or perhaps one discovers, even at this late time, a contracted pelvis, an overgrown child, an over rigid cervicovaginal canal Unless the asepsis of the case has been botched, it is not too late to perform a suprasymphyseal cervical cesarean section These are rare cases, usually it is possible to rotate the child, and bring the head into the pelvis A warning must be urged against the use of forceps in these high head cases If descent rotation and extraction are forcibly effected by forceps, the child is always injured, often killed, and the mother likewise maltreated This is one of the commonest causes of stillbirth and puerperal infection

After the head is engaged, the case is gratifyingly simplified If the cervix is fully dilated and the pains good, a little pressure upward on the forehead during a pain may aid flexion and favor rotation (Hodge's maneuver) Two fingers placed alongside the forehead on the anterior lateral inclined plane of Hodge may

direct the forehead backward, or one may try to draw the occiput forward with three fingers, as Tarnier suggested If these simple procedures and the consequential lying on the side of the occiput do not show results, or if rectal examination shows that the occiput has rotated to the sacrum, the patient should be etherized, and the head rotated to the proper position by combined internal and external manipulation Contrary to what is usually taught, this is not usually difficult, the trouble has been to hold the head in its new position long enough to apply the forceps As soon as the fingers are off the head, it rotates back again to where it was We can prevent this by the simplest of means After rotation has been accomplished, the scalp is grasped firmly with a double vulsellum or 8 inch artery clamp, and an assistant holds the head in proper position until the forceps can be applied I have performed this operation so often and always successfully that I can heartily recommend it for general practice With care, of course, and gentleness, it does no harm The little wounds are touched with tincture of iodin after delivery Even when the head is not engaged I have succeeded in rotating and holding it in position with the vulsellum, but it is best to first effect the rotation by hand, and then apply the vulsellum (In face presentation the occiput may be pulled down with vulsella for a typical application of the forceps)

Since adopting this simple and harmless method I have discarded Scanzoni's maneuver, and I have not found it needful to deliver a case with the occiput posterior

NONINTERFERENCE IN THE TREATMENT OF PUERPERAL AND POST-ABORTAL INFECTIONS *

E L KING AB, MD
NEW ORLEANS

The discussion of the policy of noninterference in the treatment of puerperal and postabortal infections before the section may appear to be simply a useless repetition of well known facts But a fairly extensive experience has shown us that, in spite of the conservative lines of treatment long advocated by practically all obstetricians and gynecologists, meddlesome and dangerous (though apparently minor) operations are still too frequently advocated in cases representing the various types of puerperal infection In checking over our own results in the obstetric service of Dr C Jeff Miller at the Charity Hospital, we have been impressed with the fact that in two cases the fatal outcome has apparently followed injudicious interference, hence, with increasing experience, we are becoming more and more conservative

The treatment employed by us is not revolutionary, and may be thus outlined, with variations to suit the individual case

A special ward is set aside for the handling of all white patients suffering from puerperal infections, this ward is also employed for the medical treatment of all other complications of pregnancy and the puerperium It is in reality a "rest ward," since no patient requiring a major operation is admitted to it On admission, a careful, general, aseptic bimanual examination is made, at the same time a culture is taken from the uterine cavity with a Little's tube if the cervix is sufficiently patulous, if firmly closed, this step is eliminated, as dilatation would of course entail a certain amount of traumatism If retained placental tissue is presenting through the partially dilated cervix, it is gently removed with the finger or with the ovum forceps, no other local manipulation, in or out of the uterus, is performed The patient is put to bed, the head of the bed being elevated if the infection is of recent origin and appears rather virulent The object of this is to facilitate drainage and, if possible, to limit the infection to the pelvis We are not sure that this posture helps us to attain these results, but are under the impression that the patients are benefited by a few days of the Fowler position at the beginning of the treatment

Hyperpyrexia is controlled by hydrotherapy, mild fever requires no treatment Fluids (chiefly water) are supplied plentifully—by mouth if tolerated, by rectum, when indicated, and at times by hypodermoclysis or intravenous saline infusion In a few cases we have transfused, but have not as yet been able to see that we have thereby improved our results The patients are nourished freely on soft or semisolid food, the only contraindications being vomiting and peritonitis The bowels are kept open by enemas saline laxatives being used only occasionally, in the infrequent cases of nausea without peritoneal involvement, small doses of calomel are sometimes given In cases of pelvic cellulitis or pelvic peritonitis, we apply a light ice bag to the hypogastrium, when the acute local symptoms have subsided in these cases we begin the employment of copious douches of plain hot water twice daily It may be weeks before the patient is considered ready for this part of the treatment

Drugs are secondary to the general supportive measures We have found the various tonics and stimulants, including alcoholics, to be of no assistance, often they are detrimental in that they are prone to disturb the patient's digestion Sleep is induced, when necessary by bromids or barbital Opiates are studiously avoided, being used only when other measures fail to relieve pain or to procure the needed sleep The usual laboratory studies are made, and we are especially careful to examine the blood for malaria, and the stools, in suspicious cases, for ova uncinaria, two fairly common infections in out-of-town patients A blood culture is taken every day for four days, as we often find it necessary to take three or four before a positive culture is obtained In cases of streptococcic bacteremia we have tried the serum treatment, but with negative results As soon as the patient begins to improve and can be moved, she is carried to the sun porch daily for a few hours of fresh air treatment

In brief, the patient is given a general supportive treatment and the pelvis is left severely alone after the preliminary examination We know that in practically all cases there is an endometritis, but we are sure that local treatment of the endometrium does more harm than good In cases of septic abortion with retention of placental tissue, we are sometimes forced

* From the Department of Obstetrics and Clinical Gynecology Tulane University of Louisiana School of Medicine
Read before the Section on Obstetrics Gynecology and Abdominal Surgery at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

to sponge the uterus out carefully on account of hemorrhage, even this gentle procedure often causes a rise of temperature In the cellulitis cases, we make vaginal examinations occasionally if the abnormal temperature persists, in order to discover accessible pus-foci, if any develop In blood stream infections, without local pelvic exudate, we as as rule make no further local examination until the patient is ready for discharge

The treatment of septic abortion with retention of placental fragments is by no means settled as yet, the measures advocated by various authorities ranging all the way from curettage to absolute local noninterference Experience with the various methods has taught us that the best results are obtained in these cases by letting the uterus alone until the temperature is normal and the uterine culture becomes negative The only exceptions are (1) patients in whom placental tissue appears through the open cervix, or (2) patients suffering from profuse bleeding due to the retained fragments However, in several cases in which there are general symptoms of moderate severity and very foul discharge we have seen the condition improve rapidly and the fever disappear quickly after removal of the retained tissue with the ovum forceps or the finger, on the other hand, other patients have developed very severe bacteremias after the same procedure Of course, the difference is due to the variations in the bacterial flora of the uteri of the different patients, so that the safer method is to follow the advice of Polak and await the report on the culture before deciding on the treatment to be followed Many of these cases will complete themselves, in the others, small doses of pituitary extract may be given and they can be completed when the bacteriologic report indicates that it is safe to do so We agree with Polak that many of these patients will need a curettage later, on account of the menorrhagia due to endometrial changes consequent on this retention

We have treated sixty cases of severe infections following abortion or full term labor, and several times this number of mild infections, with fever for only two or three days They fall into the usual categories I will first consider those under the heading of blood stream infections, with no local pathologic condition of the pelvis except the usual endometritis Thirty-three of these have been cared for, sixteen following full term delivery (most of which were either instrumental or midwife cases), and seventeen consequent on abortion, with the usual history of local interference Of the sixteen in the first group, five patients died, two of these, however, were hopeless on admission, and soon died, so that the mortality would be more correctly stated as three out of fourteen Of the seventeen in the second group, three died, showing either that the infections were not as severe, or (what is more likely) that women seek hospital care more readily after abortion, probably in search of the curettage that they are told should be performed

Of the cases presenting a local pathologic condition of the pelvis, we have treated twenty-three classified under the heading of pelvic cellulitis As these patients practically all present various degrees of pelvic peritonitis, we find it difficult clinically to draw a sharp line of demarcation between these two groups nor is it important to do so, as the treatment is the same for the two types Of these twenty-three, six patients were ultimately operated on In four cases, the operation consisted of drainage of pus pockets, which developed late, and were opened weeks after admission Two of these were abscesses of the uterine wall, which were drained by laparotomy, two others were broad ligament abscesses which were opened by incision above Poupart's ligament All these patients recovered The other two operations were not so sharply indicated, and represent errors of judgment In one case, the patient had a rather stormy time, with persistent septic temperature One of the staff thought that a pus pocket had developed, so he performed a posterior colpotomy on the twenty-ninth day No pus was found The patient died two days later with the symptoms of general peritonitis The other patient was operated on eleven weeks after full term normal delivery, her temperature had been normal for three weeks, and all of the exudate had disappeared with the exception of a small right tubo-ovarian mass Thinking that the pus (if any) was surely sterile by this time, we operated on her, and easily removed a pus tube and an abscessed ovary She died forty-eight hours later of general peritonitis I believe that these two would have ultimately recovered, had it not been for our interference

Our experience with fulminant, rapidly spreading general peritonitis has been unfortunate, which is the usual story Four cases have been treated, one by laparotomy, drainage, and enterostomy, the other patients were not operated on, but were treated as outlined above All four died

We have found that the treatment of cases of abortion, both complete and incomplete, along the same lines, is productive of very gratifying results One hundred and twenty-one complete abortions have been cared for, twenty-five of these patients had fever of a mild type, the others were afebrile Many of them were admitted as cases of incomplete abortion and completed themselves spontaneously in the ward under expectant treatment One hundred and forty-five incomplete abortions have been treated, in which nonoperative methods failed to bring about complete evacuation of the uterus It was necessary to clean out the uterus in these cases, because of persistent bleeding, this was done in 102 patients by means of the ovum forceps or the finger, in forty-three, by the use of the dull curet In the first group, there were thirty-six with mild fever at the time of removal of the retained secudines, in seventeen of these the temperature promptly dropped to normal, while in nineteen it remained elevated Sixty-six patients had no fever prior to this little operation, thirteen of these developed a rise of temperature, and two of them were very ill In the second group (curet) eight had fever before and after curettage, thirty-five with no fever were curetted, and three of them developed a mild rise of temperature after the operation All of these 266 patients were discharged as cured We have learned, however, that the gentlest of intrauterine manipulation will at times light up an infection

Summing up the immediate results, then, we have thirty-three severe cases of blood stream infection with eight deaths, two of these patients being moribund on admission, twenty-three cases of pelvic cellulitis, in seventeen of which the exudate disappeared completely, in four more drainage of abscesses

developing late completed the cure, while in two cases injudicious operation resulted fatally, four cases of fulminant peritonitis, with four deaths, and lastly, 266 cases of abortion, complete and incomplete (eighty-six of these patients had slight fever for a few days), all of whom were discharged as cured We have not been able to follow up all these patients after discharge, but the ones with whom we have afterward come in contact have been found to be in good health and to have no pelvic symptoms Some of them have since passed through normal pregnancies and labors None of them have subsequently been admitted to our gynecologic service for operation because of tubal or ovarian infection, and few, if any, have returned to the other gynecologic wards of the hospital When we consider that about 50 per cent of the cases of salpingitis in which we operate are traceable to abortion followed by some form of active local treatment (and this is our experience), we feel that the improved results, both immediate and remote, justify us in regarding the policy of noninterference as the method of choice in handing the types of infection under discussion

NOTE—Since the reading of this paper I have been asked whether we employ the same treatment in cases of pelvic abscess Of course we drain these foci as soon as we are sure that a localized collection of pus is present The point I wish to make is that we obtain the best results by abstaining from the use of the curet the intra-uterine douche and all other forms of active local treatment in cases of puerperal infection, generalized in the blood stream or localized in the pelvis the sole exception being the drainage of accessible pus collections as soon as they develop I wish to stress noninterference in all cases without localized abscess

ABSTRACT OF DISCUSSION

DR JOHN O POLAK, Brooklyn The general principles that the doctor has laid down are supported by my experience in several thousand cases of sepsis treated on very much the same lines as he suggested He seemed a little in doubt as to what the Fowler position did in these cases Our necropsy experience has shown certain things In the first place, all these infections either come through the endometrium, through the inoculation of the wound in the cervix, or inoculation of the placental site Consequently, in the majority of instances, we are dealing with an endometritis and that is taken care of usually by Nature s protective leukocyte wall If the bacteria are very virulent they will penetrate that wall, however enter the lymphatics and cause a parametritis, or a parametritis with a periadenitis If the uterus is in its proper position, it drains and rids itself of a certain amount of toxicosis By turning the patient over on her abdomen from time to time the vagina will drain also When the patient is placed in the Fowler position, the sigmoid drops down over the uterus and the omentum comes down and protects In these cases we found one thing constantly at the necrosy—the pelvis had been more or less completely sealed by the sigmoid loop and by the omentum so that a general peritonitis had been converted into a local one by posture I have also seen this at the operating table This is also true in the puerperal case where the uterus is outside of the pelvis and blocks the pelvis by a ball valve action Consequently the extension is more liable to take place to the peritoneum We have been treating the bacteremias on the general plan the doctor suggested—fresh air, fluids by rectum underneath the skin and by mouth These patients get practically no other treatment We have found of value the injection of 250 c.c. of citrated blood every four or five days The first reaction is an increase in the leukocytes That increase and also the improvement in the red blood cells disappear very promptly but after the second injection there is a greater general improvement in the blood pressure the resistance of the patient and her appearance The third time she holds all that you may give and makes a fair recovery I am pleased with the results of repeated blood transfusions in these cases of pure bacteremia

DR EDWARD L KING, New Orleans I am glad to find that the Fowler position does do good We thought it did but never held a necropsy in these cases because we could not get it The two cases that I mentioned were not the type that would show anything about the value of the Fowler position We have not tried the repeated transfusions We have tried giving 500 or 600 c.c. at one time in several cases and found that it did not seem to help much

CYSTS OF THE PANCREAS*

JOHN J GILBRIDE A.M., M.D.
PHILADELPHIA

True cysts of the pancreas are due to an obstruction of the outflow of the secretion, with a retention of the fluid and dilatation of the ducts or acini (retention cysts) or they occur when spontaneous proliferation of epithelial elements of the gland is followed by accumulation of fluid in cavities that are formed (cystic tumors) [1]

The latter cysts are called proliferation cysts, and include cystic adenoma and cystic carcinoma Hydatid cysts occur rarely in the pancreas Tricomi states that seven cases have been recorded Of congenital cystic disease a few cases have been recorded by Pye-Smith [2] Richardson Shattuck and others

Hemorrhagic cysts of the pancreas occurred following trauma in which bleeding took place into the substance of the pancreas [3] The presence of blood in the cystic contents does not establish a hemorrhagic origin to the cyst as the blood may be present as the result of erosion of the vessels due to action of the cystic fluid

Korte has applied the term "pseudocyst" to those cysts in relation with the pancreas but which are not of pancreatic origin The inclusion of these tumors within the term "pancreatic" is clinical and due in large part to the difficulty of establishing at operation, the pancreatic origin of these cysts Perhaps the greater number of cysts in relation with the pancreas that are encountered by the surgeon, and that have been reported in the literature as pancreatic cysts, are those cysts due to contusion of the upper abdomen with accumulation of fluid in the lesser peritoneal cavity and which belong to the pseudocysts

Virchow himself stated that he was unable to determine the origin of a large cyst attached to both the pancreas and the stomach Records of postmortem examinations in cases of cysts of the pancreas are not numerous

Retention cysts of the pancreas have been described by Virchow [4] as being of two forms In one the whole duct is dilated with the occurrence of a "rosary-like" dilatation which he called "ranula pancreatica" In the other group the duct is obstructed at its outlet and becomes distended into a cyst which may become the size of one s fist and may contain mucoid, hemor-

rhagic or calculous matter. The causes of retention cysts are (1) the impaction of a calculus or calculi, (2) cicatricial stenosis, (3) pressure on the duct from without, or (4) a dislocation of a part of the gland (Moynihan). Klebs[5] has applied the name "acne pancreatica" to numerous small dilatations of the minute ducts.

The late Nicholas Senn made the statement that a cyst of the pancreas could not occur as the result of an obstruction to the pancreatic duct in the normal pancreas. Ligation of the ducts of Wirsung and Santorini in dogs did not produce a pancreatic cyst, but, as Opie has pointed out, this does not apply to the actual conditions in man for the reason that there are things about cyst formation in the pancreas that we do not understand.

Proliferation cysts arise as true tumors.[6] Fitz[7] collected nine instances of proliferation cysts. Eight of these occurred in women. Cystic tumors of the pancreas have rarely been malignant.[8]

According to Opie, the formation of cysts which do not occur in other glands is doubtless dependent on particular properties of the pancreatic juice, and their contents are in part at least products of the pancreatic secretion. Ligation of the pancreatic ducts in animals causes chronic inflammation of the gland with little dilatation of the ducts behind. The occlusion of the pancreatic ducts by tumor, gallstones, or pancreatic calculi is usually unaccompanied by cyst formation, but occasionally multiple cysts result. Occasionally, cysts of large size have been associated with gallstones lodged near the orifice of the pancreatic duct.[9] Chronic pancreatitis has been regarded by Tilger[9] as an important factor in the production of pancreatic cysts, for he has thought that scarlike bands of connective tissue compress and occluded the ducts. Chronic pancreatitis, on the contrary, may also be secondary to the cyst formation, for example, by compression of neighboring ducts, cysts cause chronic inflammation. Occlusion of ducts which may be either the cause or the result of cyst formation, is always followed by interlobular pancreatitis, and when this lesion implicates the entire gland and is far advanced, diabetes mellitus ensues.[1]

Pseudocysts, so called, may be formed within the substance of the pancreas as the result of degenerative changes affecting the interstitial tissue of the gland, and their formation and increase in size is doubtless dependent largely on the presence of the irritant and corrosive products of the pancreatic secretion. A large number of the so-called pancreatic cysts occupy the lesser peritoneal cavity.

Of 121 instances collected by Korte, sixty were in males, fifty-six were in females, and no sex given in the remaining five. The youngest was in a child 13 months old (Shattuck). Stieda operated on a man 76 years old. The cystic tumor may be situated at any part of the gland. In twenty-two instances collected by Hagenback, the cyst had its origin in the head four times, once in the body, ten times in the tail, and in seven the site is not given. Nimier, according to Moynihan, reports its occurrence twenty-one times in the tail, six times on the body, four times in the head, once in the head and body, and once the whole organ was implicated.

Cysts may be single or multiple, unilocular or multilocular. Two cysts may be simultaneously observed of almost equal size, or, after the healing of the cyst a second may develop in a distant portion of the gland and necessitate further operation. One small cyst may be found with a large number of smaller cysts packed in the walls (Moynihan).

The cysts are generally smooth and rounded, elastic and rather tense. In the early stages true pancreatic cysts are usually lined by a single layer of flattened, cylindric epithelium, which frequently disappears in the long standing cysts, owing to the action of the cystic contents. Pseudocysts are never lined by epithelium. Their walls are always composed of fibrous connective tissue. In a case reported by McPhedran[10] a pseudocyst and a true cyst of the pancreas occurred.

CONTENTS

The character of the fluid within the pancreatic cyst varies greatly. It may be clear, milky, brownish red or nearly black. It is nearly always albuminous, but frequently furnishes little evidence concerning the origin of the lesion. The contents of the pancreatic cysts are occasionally viscid, and the presence of mucin has been demonstrated. Microscopic examination usually reveals the presence of epithelial cells, globules of fat, crystals of fatty acid, red blood cells, leukocytes and necrotic tissue.[1] It is often possible to demonstrate one of the three well known enzymes of the pancreatic juice in the contents of pancreatic cysts but proteolytic, lipolytic and diastatic enzymes have been found in the fluid removed from abdominal cysts which have not had their origin in the pancreas. Korte has found a weak diastatic enzyme in a mesenteric cyst. The presence of polymorphonuclear leukocytes may give proteolytic activities to any fluid that contains them, whereas the wide distribution of fat-splitting enzymes is well known. Moreover the contents of true cysts of the pancreas may exhibit no enzymatic activity. Antitryptic action of the blood serum may explain the absence of trypsin in hemorrhagic cysts and Heidenhain[11] has shown that enzymes disappear in the secretion of chronic inflammation of the gland. An examination of the fluid present is not always conclusive in establishing the pancreatic origin of the cyst. Nevertheless, if an abdominal cyst contains fluid capable of digesting coagulated egg albumin or of splitting starch, its origin in the pancreas is probable.

SYMPTOMATOLOGY

The early symptoms of pancreatic cyst are usually trivial, and are chiefly those due to interference by pressure with the surrounding viscera. The patient complains of a distress or a sense of fulness, especially after eating. Pain varies greatly and in some cases is of little diagnostic value. However, in some cases the attacks of pain occur periodically, are of a cramplike character, and suggest the presence of gallstones, indeed, in one case,[9] a diagnosis of gallstone had been made by several physicians who had examined the same patient. The pain is generally confined to the upper abdomen, and may extend around to the left side or through to the back. Nausea and vomiting occur occasionally. They are not common, and when vomiting does occur it is usually due to adhesions between the stomach and the cyst wall. It may recur periodically and be quite severe. The bowels are fre-

quently constipated, but occasionally diarrhea occurs The patient may complain of weakness, and frequently there is a considerable loss of weight Patients have lost as much as 20 pounds or more during a period of several months In other cases the loss of weight was so great as to arouse a suspicion of the presence of malignancy The appetite is variable Jaundice is only rarely present Korte found it recorded in only nine cases out of 121, the jaundice being due to pressure on the common duct by cysts of large size which are almost always situated in the head or neck of the pancreas Dilatation of the superficial branches of the portal vein have been recorded in a few instances Ascites and edema of the lower extremities have occurred in two cases, as did obstruction of the right ureter in two patients [12] Steatorrhea or disturbance of the protein digestion is rare [7] Diabetes occurred in nine instances out of 136 collected by Ozer Lazarus mentions one case of alimentary glycosuria Occult blood may in some cases be present in the gastric contents or in the feces, or in both

PHYSICAL EXAMINATION

Cysts of the pancreas are usually spherical, smooth and tense In a series of cases reported by Korte, that author found forty-eight in the median line of the abdomen between the ensiform cartilage and the umbilicus Forty of these were to the left of the median line, and eight were on the right side In a great majority of cases, cysts bulge between the stomach and the transverse colon The cyst may push itself above the stomach or between the stomach and the liver This is especially likely to occur when the cyst arises from the upper border of the pancreas Cases have been reported by Riedel and others in which the transverse colon was pushed down as low as the symphysis pubis If the cyst arises from the lower border of the pancreas, the transverse colon may run directly across the cyst or the cyst may, as it frequently does, project below the transverse colon with a bulging of the transverse mesocolon Schwartz [13] reported a case in which the cecum was in front of the cyst, and Martin a case in which the descending colon was overlying the cyst This also occurred in the case I report Dreyzehner [14] has described a case in which the cyst arising from the head of the pancreas grew to the right and lay behind the peritoneum, displacing the right kidney Da Costa [15] mentions a case of pancreatic cyst which appeared in the right flank and which resembled a hydronephrosis McPhedran [16] says that cysts of quadrilateral shape in the region of the pancreas and extending toward the left kidney are likely to be of pancreatic origin

Cysts of the pancreas usually possess little motility, since that organ is fixed in its position and behind the peritoneum However, cysts when attached to the tail of the pancreas in some cases may be moved about freely

In one case reported by Lazarus the cyst could be moved from the left hypochondrium to the right mammillary line Cysts in contact with the diaphragm usually possess respiratory motility Cysts in contact with the aorta may transmit pulsation which is not expansile and which can be differentiated from aneurysm of the abdominal aorta by placing the patient in the knee-chest position, when there will be no pulsation Inflation of the stomach and colon will aid one in determining the relationship of the cyst to the surrounding viscera Collections of fluid in the lesser peritoneal cavity usually form very rapidly Mesenteric cysts are usually in the region of the umbilicus

In the case here reported the duct opening into the cyst was found and closed by a purse-string suture

REPORT OF CASE

History—A man aged 20, born in the United States a baker, referred to me by Dr W H Kelly of Philadelphia sent to the Medico-Chirurgical Hospital, where I operated on him Aug 20, 1913 had had the usual diseases of childhood measles and chickenpox The history otherwise was negative There was no history of syphilis The family history was negative For the last four months he had noticed a swelling in the left side of the abdomen which had gradually been getting larger He also complained of some soreness and pain across the upper abdomen Recently he complained of weakness and inability to work which along with baking consisted of handling barrels of flour His appetite was good and his bowels were regular He also had lost about 10 pounds in weight during the previous three months He had never been jaundiced

Physical Examination—The patient was of medium height with good color and fair nutrition Examination of the eyes was negative The condition of the teeth mouth pharynx and nose was good The chest was normal the lungs and heart negative There was a tumor-like swelling to the left of the middle line of the abdomen extending from the epigastric and umbilical regions to the left hypochondria and left lumbar regions There were in reality two tumor masses The mass near the median line was about the size of a fist the other and lateral swelling was separated from the median mass by a slight abdominal recession and it was about the size of a hen's egg and located in the region of the lower pole and inner side of the left kidney The outlines of both masses were regular fairly well circumscribed smooth elastic and only slightly tender to the palpating hand There was not any respiratory mobility, between the two tumor masses was a narrow tympanitic area that I believed to be the descending colon This view proved to be correct by colonic inflation The percussion wave was transmitted from one mass to the other Examinations of the urine and feces were negative The transverse colon was above the mass

Blood Examination Hemoglobin (Sahli) was 82 per cent, red blood corpuscles numbered 4,200 000, white blood corpuscles 8 000

Gastric Contents After an Ewald test breakfast total acidity was 40 free hydrochloric acid 16 Motility was normal There was no occult blood

Operation and Result—Under ether anesthesia an incision was made through the sheath of the left rectus muscle and the lower layer of the transverse mesocolon was torn through exposing the cyst wall The cyst was drawn up a trocar was introduced and the contents of the cyst were withdrawn I then enlarged the cyst opening with a pair of scissors and sponged away the remaining fluid I found a small opening in the wall of the cyst leading to the cyst cavity this was the opening of one of the radicles of the pancreatic duct With a small curved needle armed with linen thread I introduced a purse string suture which when tied closed the aperture I then stitched the wall of the cyst to the parietal peritoneum and lightly packed the cyst cavity with gauze which was removed on the third day The patient made an uninterrupted recovery He stated that prior to the onset of his trouble he thought that in handling barrels of flour he had strained himself on one occasion The cystic fluid was a clear viscid coagulated egg albumin and converted starch into sugar

Rupture of pancreatic cysts due to a fall or trauma over the abdomen have been reported by Schwartz Bull [17] and others The disappearance of the cyst in

both instances was associated with diarrhea The inference is that the cyst ruptured into the intestine

TREATMENT

The treatment consists of (1) evacuation and drainage, the cyst being stitched to the abdominal wall (Gussenbauer's method), (2) exposure of the cyst and operation in two stages, i e, by the insertion of gauze until adhesions have formed, and subsequent opening of the cyst at the expiration of three or more days, and (3) extirpation, partial or complete

Evacuation and drainage is thus performed The abdomen is opened either to the right or to the left of the median line, depending on the location of the cyst The incision is made through the sheath of the rectus muscle The cyst wall is exposed by tearing through the omentum The cyst most frequently protrudes between the stomach and the transverse colon, being covered by the gastrocolic omentum Care should be taken to avoid large vessels, which are usually present A careful examination of the cyst is made to determine its source, the extent of adhesions and the condition of the pancreas, together with the relation of the cyst to the surrounding structures The most prominent part of the cyst is brought into the wound, and gauze sponges are placed so as to protect the peritoneal cavity and the abdominal wall from being soiled An aspirator needle or trocar is thrust into the cyst, and its contents are evacuated into a sterile container for future examination On withdrawal of the aspirator a clamp is placed on the opening of the sac The sac wall is now united by a continuous suture to the parietal peritoneum by using a curved needle threaded with catgut, silk or Pagenstecher thread The forceps are then removed from the cyst opening and a piece of large rubber tubing is introduced into the cyst cavity, where it is fixed by an anchor stitch to the cyst opening, and the cyst wall is closed around the rubber tubing by the use of purse-string sutures

The two stage operation has not been used very frequently during recent years

Some surgeons drain cysts of the body and tail of the pancreas by making an incision in the left lumbar region at the border of the erector spinae muscle and its junction with the last rib The lumbar fascia is divided, with the finger one pushes the descending colon forward, the cyst wall is reached, incised, and drainage is inserted In the event that one has not made a positive diagnosis, the incision through the abdominal wall is preferable Some surgeons, after operating through the abdominal wall have evacuated the cyst and, establishing drainage, have made a counter opening through the loin It seems to me that the single operation of drainage anteriorly is sufficient It may be necessary to resort to the two stage operation in some instances in which either through the size of the cyst, or its location the stitching of the cyst wall to the abdominal wall may offer considerable difficulty Under the circumstances one may insert gauze packing, allowing it to remain for several days until sufficient adhesions shall have formed to protect the peritoneal cavity The cyst is then incised and drained

Extirpation, either partial or complete, has been performed by a number of surgeons In some cases it has been successful In other cases the procedure had to be abandoned owing to the character of the adhesions, the presence of large blood vessels, and the danger of wounding the splenic vessels In other cases it has been possible to ligate the pedicle (Clutton and others), divide it with the thermocautery (Kosinski) or clamp it with forceps (Pincet)

Aspiration, except in ascites, has no place in abdominal surgery Drainage in some cases may continue for a prolonged time

Under no circumstances is any solution to be injected into the cyst cavity, with the idea of causing cessation of secretion, for cases have been reported in which this procedure was attempted and it was followed by disastrous results

1934 Chestnut Street

ABSTRACT OF DISCUSSION

DR A C SCOTT, Temple Texas I wish to report a case of pancreatic cyst not quite the size of the average cocoanut It stood up rather prominently in the midline and appeared to be fairly movable, although it was very evident that it was attached posteriorly It had a little movement in response to the diaphragm We could take hold of it and move it from side to side two or three inches The top of the mass seemed to be freely movable We undertook the removal of this cyst Had we persisted in our efforts, the patient might have died Rather extensive bleeding occurred from almost every point from which we undertook to dissect the cyst from the pancreas proper, and the pancreatic tissues came up on the under side of it like part of a flower When we got through with it, it was like a bulb, with the pancreas coming half way up on its side In our efforts at stripping it loose on the under side, we accidentally tore a hole in the vena cava By pulling on the cyst and holding my thumb down, I could control the bleeding temporarily We closed the opening in the vein with silk sutures We succeeded in removing about two-thirds of the growth

DR MOSES BEHREND, Philadelphia Acute cases are operated on the first week Chronic pancreatic cysts may be considered those that have been in existence many months or years I have seen two cases of chronic pancreatic cysts, one a traumatic condition, the entire lesser peritoneal cavity being filled with the hemorrhagic fluid which seemed to come as the result of injury to the pancreas The other case was of undetermined origin, but probably resulted from an attack of acute hemorrhagic pancreatitis It is not necessary to remove these cysts If you do you will have the same trouble Doctor Scott had It is desirable to suture the cyst to the parietal peritoneum and pack with gauze The cavity will be obliterated by the irritation of the gauze packed into the cyst I want to caution you against removing the gauze too soon Leave it in at least eight days

DR MARCELL HARTWIG Los Angeles Cysts must be considered in an anatomic way, that is, whether or not they have an epithelial lining with glands If cysts have no epithelial lining, they will shrink with the simplest kind of an operation I puncture the cyst with a trocar at the point where the cyst and the abdominal wall touch, and then introduce a catheter In this way you can cure practically every cyst

---

Bolted Versus Whole Wheat Flour—It is evident that in the milling of flours there comes a point where the law of diminishing returns begins to play, that is, there is a percentage at which the milled flour is the most efficient food deliverer That the flour must not be milled to too high a percentage is evident for the great cellulose content will not only hamper the digestion of the protein, but will interfere with the digestion of the carbohydrates In the case of the German flours during the war, especially when the one great problem of the diet was protein, the mistake of grinding out to 94 per cent is obvious Not only was the bread actually less efficient as a food, but by milling to a lower percentage the bran would have been used as a fodder, thus putting it to a useful purpose instead of allowing humans to eat it with no good to them, rather it did actual harm, in that it caused indirectly, a portion of the available protein to be lost—C C Mason *Bull Johns Hopkins Hosp*, March, 1920

TREATMENT OF DIABETES COMPLICATED BY PULMONARY TUBERCULOSIS *

N W JANNEY, PH D, M D
AND
R R NEWELL, M D
SANTA BARBARA, CALIF

The question whether undernutrition is properly applicable to the treatment of diabetes complicated by active pulmonary tuberculosis is the theme of the present paper Interest in this problem has been enhanced by the general adoption of the Allen diabetic regimen during the last five years which emphasizes the opposed principles in the handling of these diseases, diabetes being treated by fasting, undernutrition and exercise, tuberculosis by maintaining normal nutrition and rest That the results obtained in general are discouraging is well indicated by the very paucity of the literature [1] on this subject, for physicians are loath to report their failures Through the establishment of a specially organized metabolic unit in southern California, excellent material and working conditions have been afforded for a study of this not uncommon pulmonary complication of diabetes, the results and deductions obtained being presented in this report In order to study properly the treatment of diabetes in the presence of tuberculosis, questions of etiology and mutual modifications of the clinical pictures of these diseases must first be regarded

ASSOCIATION OF DIABETES WITH PULMONARY TUBERCULOSIS

There seems to be no question of the rarity of the development of diabetes in patients exhibiting active tuberculous disease Montgomery, in his excellent study of this subject, obtained data from twenty-five tuberculosis sanatoriums in the United States reporting, among 31,834 cases of tuberculosis, 101 cases showing glycosuria, that is, ⅓ per cent, only ⅙ per cent exhibiting developed diabetic symptoms, whereas more than 1 per cent of our population develop diabetes [2] Indeed, Montgomery failed to find a single unquestionable case of diabetes developing in the presence of tuberculosis By this is probably meant active tuberculosis, as Joslin cites instances of diabetes developing in cases of latent or inactive tuberculosis Several of our cases give a history indicating activity before but not at the time of onset of the diabetes In one instance a clear history of this pulmonary affection was elicited occurring twenty years previously It is evident, then, that diabetes attacks less frequently the actively tuberculous subject than normal individuals The ultimate reasons for this are not entirely clear It may be noted, however, that diabetes is a disease frequently preceded by obesity and commonly also by dietetic excesses These conditions are rarely encountered in cases of tuberculosis in periods of pronounced activity, which causes loss of weight and decreased appetite Indeed, it would seem that undernutrition safeguards against the development of diabetes Again, the hygienic treatment of tuberculosis may tend to lessen emotional and nervous strain, which is an accepted etiologic factor in diabetes Metabolically considered, it is probable that the fuel and tissue replacement requirement in the tuberculous patient diverts to these channels protein and fat split products which otherwise through synthesis contribute to glucose formation in the body It is possible that increased fuel requirements may even decrease the carbohydrate available for excretion in the individual disposed to glycosuria

With regard to the frequency of tuberculosis among diabetics, the older statisticians report an incidence varying from 15 to 25 per cent Joslin, however in 1,146 cases, observed from 1894 until December, 1916, noted only 3 1 per cent as tuberculous which may probably be accounted for by the fact that his cases were chiefly private and lived under better hygienic conditions, and moreover, that treatment especially in the hands of this great student of diabetes, was improving during this period Apparently in the fatal cases of diabetes reported, phthisis is infrequent von Noorden finding 5 1 per cent, Montgomery 8 5 per cent, and Joslin in 439 cases (1894 until December, 1915) 3 6 per cent tuberculous But Naunyn, S West, R T Williamson and J Seegan in a total of 216 postmortems reported tuberculosis in from 40 to 50 per cent. of dead diabetics This discrepancy in frequency between the cases examined at necropsy and those not so examined is probably due to failure of recognition of phthisis in the presence of diabetes It is difficult, however, to demonstrate statistically that tuberculosis is more frequent among diabetics than even among the population at large for according to Rosenow, Baldwin and other authorities about one third of the total deaths of the entire population are due to pulmonary tuberculosis There will also be remembered the well known data of Naegele, who found tuberculous lesions in 90 per cent of a large number of necropsies In a total of twenty-one carefully studied recent cases, sixteen reported in the present paper and six from the Rockefeller Hospital,[3] diabetes preceded the active tuberculous outbreak in every case, except one of doubtful history

CLINICAL ASPECTS OF DIABETES ASSOCIATED WITH PULMONARY TUBERCULOSIS

All grades of diabetes may be found among glycosurics developing tuberculosis Of our series, nine cases were mild, four moderate, and three severe There is little question that rapidly progressive tuberculosis, especially when accompanied by febrile reaction, may definitely lead to increase of food and glucose tolerance in the diabetic In Case 10, sugar appeared in the urine on a diet of 17 calories per kilogram and 20 gm of carbohydrates The same patient, after developing acute caseous tuberculosis, was able to take 30 calories per kilogram and 30 gm of carbohydrates without glycosuria or ketonuria, blood sugar at times ranging as low as previously (Chart 3) It is interesting that our series of diabetics with pulmonary lesions rarely showed dangerous acidosis symptoms, although 25 per cent were low tolerance cases The same factors (as already mentioned) which make the incidence of diabetes in active tuberculosis a medical rarity no doubt play a protective role with regard to acidosis when both di-

eases have developed The blood sugar of phthisical diabetics runs no higher than in uncomplicated diabetes We have found it, however, much more difficult to reduce to the normal by diabetic treatment This tendency is likewise observed among glycosurics exhibiting other infections Of our seven fatal cases, two of the patients died in diabetic coma In one the phthisis was readily controlled by rest and diabetic treatment, but the diabetes was severe, the fatal outcome being induced by gross dietetic indiscretions The other case was too complicated to permit of conclusions It is our clinical impression that, on accumulation of statistics, severe acidosis will be found to develop rarely in the presence of active tuberculosis

CLINICAL ASPECTS OF TUBERCULOSIS ASSOCIATED WITH DIABETES

A very important question is whether the pulmonary process usually begins to show activity in the untreated or the treated diabetic condition Table 2 shows that in sixteen cases, only five of the patients developed tuberculosis while sugar-free Only one of these five was at this time living on a diet of less than 30 calories per kilogram Of the ten patients developing the pulmonary infection while showing sugar, seven were on unrestricted diet There is, then, excellent evidence indicating that the tuberculous outbreak occurs more often in the diabetic showing sugar and carelessly treated than among strictly treated patients living

Cases 1 to 9 were considered ketone free when the ferric chlorid reaction was negative in the urin In Cases 10 to 16 and in second and third entries of Case 8 the criterion was a negative nitroprussid reaction in the urine

† Three entries (see graphic chart)

‡ In Case 1 tuberculosis of right apex diagnosed at the age of 24 which cleared after two months on the Riviera In Case 5 night sweats for ten years In Case 6 slight morning cough for six years In Cases 3 4 and 7 the tuberculous activity was discovered at physical examination In Case 10 signs of activity were absent at first physical examination

sugar-free Deductions from this fundamental fact will be made later

It is interesting to note that the prevalence of tuberculosis among diabetics has been ascribed to the well known proclivity of the tubercle bacilli to grow in saccharin mediums This has been properly challenged by Montgomery, who observes that glucose solutions in vitro must have a concentration of at least 5 per cent in order to encourage growth of these microorganisms Human diabetic body tissues and fluids, except urine, rarely contain more than 1 per cent of glucose

Ignorance, poverty and its attending lack of hygiene play a more important causative role than does undernutrition Thus, we have already noted the decreased incidence of tuberculosis in privately treated diabetics Undernutrition per se does not seem to dispose to tuberculosis in the absence of the other factors just mentioned Preyss [4] noted in underfed animals no appreciable effect on the development of tuberculosis In many chronic diseases producing emaciation, no especial tendency to phthisis has been noted Such are pernicious anemia,[5] leukemia and exophthalmic goiter [6] Available statistics of tuberculous diabetics treated by low diets show no increase of mortality

TABLE 2.—ANALYSIS OF SIXTEEN CASES SHOWING THAT IN THE MAJORITY THE DIABETIC CONDITION WAS POORLY TREATED AT ONSET OF TUBERCULOUS ACTIVITY

Of 946 diabetic cases seen by Joslin [7] before inauguration of the Allen treatment in December, 1915, mortality due to pulmonary tuberculosis was 1 7 per cent Thereafter, among 748 cases, but one person died of phthisis

Pathologically considered, the acute caseous type of tuberculous infection characterized by rapid extension with cavity, and little tendency to fibrosis, has in the past been especially accredited to this pulmonary infection among diabetics Thus, West [8] in 1902, reporting fifty necropsies on diabetics, found of twenty-one showing tuberculous lesions seventeen to be active and the cause of death, only four cases being of the chronic type There is certainly no question that galloping consumption may seize on the diabetic Of our series, five such cases, or 31 per cent, have been observed three rapidly fatal, and one passing out of observation with small chance of recovery Montgomery has reported other cases We have, however, found the great majority of cases to be, just as in uncomplicated tuberculosis, fibroid with low grade activity

The clinical symptoms of phthisis developing in diabetics are especially insidious All writers agree as to this The loss of vitality, weight and strength is so well accounted for by the diabetes that the presence or gravity of the pulmonary complication is frequently overlooked The great frequency, as compared to living cases, of serious pulmonary tuberculous lesions in diabetic necropsies has been mentioned This may be condoned to some extent by the absence of clinical symptoms of phthisis The chest signs in even very extensive lesions may be relatively insignificant, hemoptysis, cough and sputum not marked or absent, and the temperature normal Subnormal temperatures, just as in uncomplicated diabetes, are not uncommon the evening temperature being, however, from 0 5 to 1 degree higher than the morning In 50 per cent of our cases of active tuberculosis associated with diabetes the temperature was normal or subnormal There may be no night sweats until near the end The bright eye and the hectic flush of the phthisic, as well

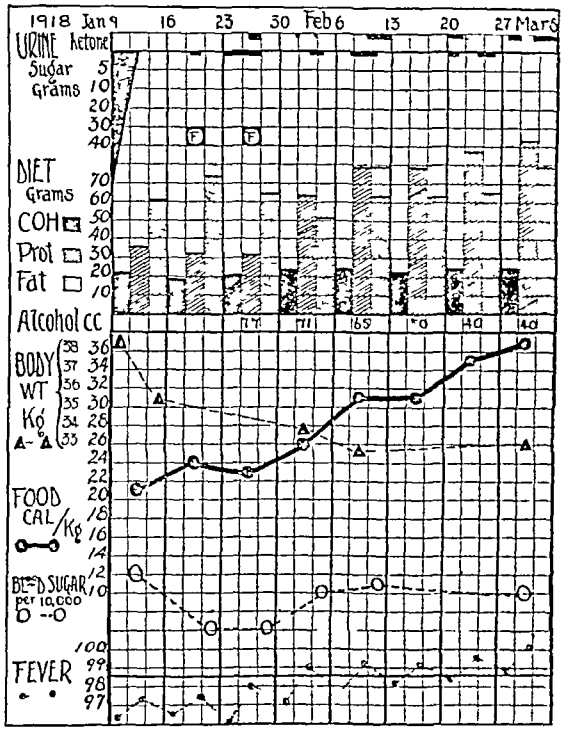

Chart 1 (Case 2).—Effect of fasting and low diet in lighting up a fatal tuberculosis in a diabetic In this and the subsequent charts the average daily diet has been calculated for each week carbohydrate protein and fat being shown schematically alcohol in numerals below Average daily caloric intake has been given as food calories per kilogram of body weight The temperature curve shows the average lowest and average highest temperatures for each week Fast days are indicated by an F within a circle half diet days by an F within a half circle

as the dusky reddened cheeks of the diabetic are missed in these cases In spite of contrary reports by others our series have furthermore all presented the dull ocular expression and pallor of the chronic invalid The characteristic optimism of the tuberculous is frequent Of laboratory tests it may be said that sputum is often negative until great pulmonary involvement has already occurred Only two of eleven cases of the chronic fibroid type have shown bacilli We have not sought sugar in the sputum of our series as we have deemed its presence no aid in diagnosis or treatment The roentgen ray, on account of the frequent latency of diabetic phthisis, becomes of more than usual help in diagnosis

PROGNOSIS OF DIABETES ASSOCIATED WITH PULMONARY TUBERCULOSIS

The prognosis to a great extent is that of the particular type of either disease exhibited by the patient, but is made somewhat more serious by the presence of the other But this is not necessarily true We have observed a severe case (Case 4) of diabetes of eight years' standing, in the course of which neither fasting nor prolonged periods of undernutrition caused a chronic pulmonary tuberculosis to show more than its usual slight activity The reverse is also observed A light diabetes may become no worse, or even the tolerance increase, in a case of fatal phthisis Indeed, rapid increase of tolerance in a diabetic with a pulmonary lesion, accompanied by increase of strength and general well being, is to be regarded as suspicious of insidious extension of the tuberculosis The lives of sufferers from these two grave maladies can only rarely be ultimately saved, but judicious treatment of the patient may be followed by the clearing up of all diabetic symptoms over long periods and cessation of tuberculous activity, with prolongation of life indefinitely

Institutional treatment of proper nature gives these patients much more hope, but unfortunately they are *personae non gratae,* both usually in the tuberculosis sanatorium and in the diabetic clinic, in either case on admission failing to get ideal treatment for one or both conditions Of our series, seven of sixteen have died, three of these fatal cases showed marked improvement on diabetic treatment The results here reported are more hopeful than is to be expected from home or ordinary hospital practice, for they were obtained in an especially organized and supported metabolic clinic provided with a trained dietetic, chemical and clinical staff The all-year-round mild climate of Santa Barbara has aided to make conditions as to improvement of the pulmonary conditions nearly ideal, as the treatment even of bed cases could be continuously carried out in the open air

TREATMENT OF DIABETES COMPLICATED BY PULMONARY TUBERCULOSIS

The course adopted in virtually each instance of the present series of sixteen cases has been to combine modern diabetic treatment with rest The case histories have been analyzed in Table 1 The results obtained may be thus epitomized Virtually all cases were rendered free of sugar within a period varying from two to six days Acidosis, when present, disappeared Most cases within one week failed to show diacetic acid and acetone in the urine In the two cases (9 and 13) in which the glycosuria did not disappear, treatment for urgent personal reasons was discontinued within a fortnight, the sugar having greatly diminished in both

Case 8 (Chart 2) illustrates three periods of improvement of both diabetes and tuberculosis resulting from strict diabetic treatment in the clinic Relapses of the pulmonary complication were associated with lapses from diet With bed rest and sufficient dietary restriction to control the diabetes, fever disappeared on the second day, never to return The cough, weakness and lung signs improved promptly, and the patient would again take up his occupation After leaving the clinic for the third time, he attained a normal blood sugar and gained 2 kg in weight, only to break diet again and die in diabetic coma

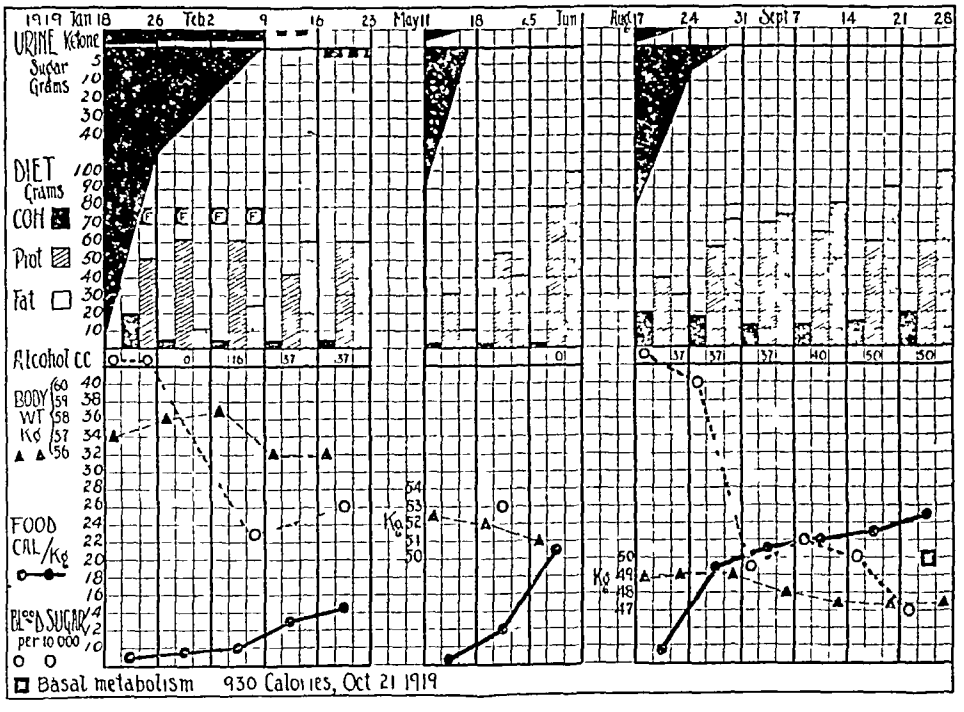

Chart 2 (Case 8) —Three periods of improvement in a severe diabetic case complicated by pulmonary tuberculosis The breaks in the chart indicate periods of home treatment

Blood sugar could be reduced to the normal in three cases This is unquestionably a lower percentage than that now observed in this clinic among uncomplicated diabetics, in the treatment of which a persistent effort is made to reduce the blood sugar to the normal and cause it to remain there The higher blood pressure level in this series may be ascribed mainly to the effect of the pulmonary infection, but in part probably also to our reluctance to push the undernutrition as far as in the diabetic with sound lungs Be this as it may, the blood sugar may be fairly regarded even in the phthisical diabetic as the best single laboratory guide to treatment, yet it is remarkable that the blood sugar in the cases in which death was due to tuberculosis fell to normal or subnormal, 7, 8, 10 per 10,000

In analyzing the results of the treatment of the tuberculosis, it was observed that cough and expectoration were present in ten cases, disappeared or improved in six, became worse in one and appeared de novo in one instance Six patients entered with elevated temperature This fell to normal in two cases In two

fatal cases, fever developed in the hospital Of ten patients showing both emaciation and weakness, six improved in strength, but one gained in weight Weight, however, is seldom attained in the treatment of uncomplicated diabetes The physical signs showed improvement in seven cases, remained unimproved in six, and became worse in three cases

Dietetic Technic—As in uncomplicated diabetes, this must be individualized However, our usual procedure was to order the patient a sufficiently decreased ration of protein and carbohydrate without addition of fat until the patient was sugar-free and the acidosis controlled, and then to increase the protein to between 1 and 2 gm per kilogram of body weight The carbohydrate and fat were subsequently increased The mild degree of acidosis usually encountered in the phthisical diabetic renders it likely that he is more fat tolerant than the ordinary diabetic, especially when febrile The permissible ratio of carbohydrates to fat has not yet been exactly defined Every effort is made to give as much protein and as many calories from the start as is consistent with effectual control of the diabetes Frequently more than 30 calories per kilogram were fed, especially to fever patients, when this value has reached 50 When the patient is taking sufficient calories to maintain his weight and strength, has a normal or low blood sugar, and improved tuberculous condition, he is judged fit for discharge with due precautions

Undernutrition and Fasting Relative to the advisability of employing a low diet in the treatment of diabetes complicated by tuberculosis in these cases one should be mindful of the important etiologic factor brought out in this study namely, that *the majority of our patients developed tuberculosis during the periods of neglected diabetic treatment during which sugar had appeared in the urine* (Table 2) If, then, decreased resistance and defective metabolic processes manifested by the glycosuric diabetic predispose to the development of tuberculosis and not, as has been already demonstrated, undernutrition per se (see above), we have here the chief indication for the treatment that has been followed in our series of cases Most diabetics with the pulmonary complication bear undernutrition exceedingly well, often with coincident improvement of the chest condition (see charts) It would be a grave error to take for granted that the principle of undernutrition can be applied without the utmost circumspection Thus the routine application of fasting is certainly best avoided

As we view it, the question of whether or not fasting or simple reduction of the diet should be advised is not worthy of being raised, as the principle is precisely the same Fasting was employed with good results in a number of our earlier cases reported in this series whose treatment was supervised by our distinguished colleague, Dr Nathaniel Bowditch Potter, the deceased founder of this clinic, whose own case is reported in this series For the past year fasting has not been employed in any case of diabetes complicated with tuberculosis The results are certainly as satisfactory as when fasting was employed In treating the great majority of uncomplicated diabetics fasting can now usually be avoided with considerably lessened hardship to the patient A diet low in carbohydrates and protein with fat omitted renders the patient in all but severest cases sugar-free in a few days at most, and also gives much more information than does fasting, concerning his true tolerance Though feared to an exaggerated degree by the profession, there is certainly a distinct element of danger in undernutritional treatment which can best be illustrated by Case 10, in which a prolonged period of fasting and protein starvation was maintained by a general practitioner who failed to recognize the presence of tuberculosis Our own treatment erred, we feel, in permitting too much exercise which hurried the development of rapidly fatal acute caseous tuberculosis extending from an old focus

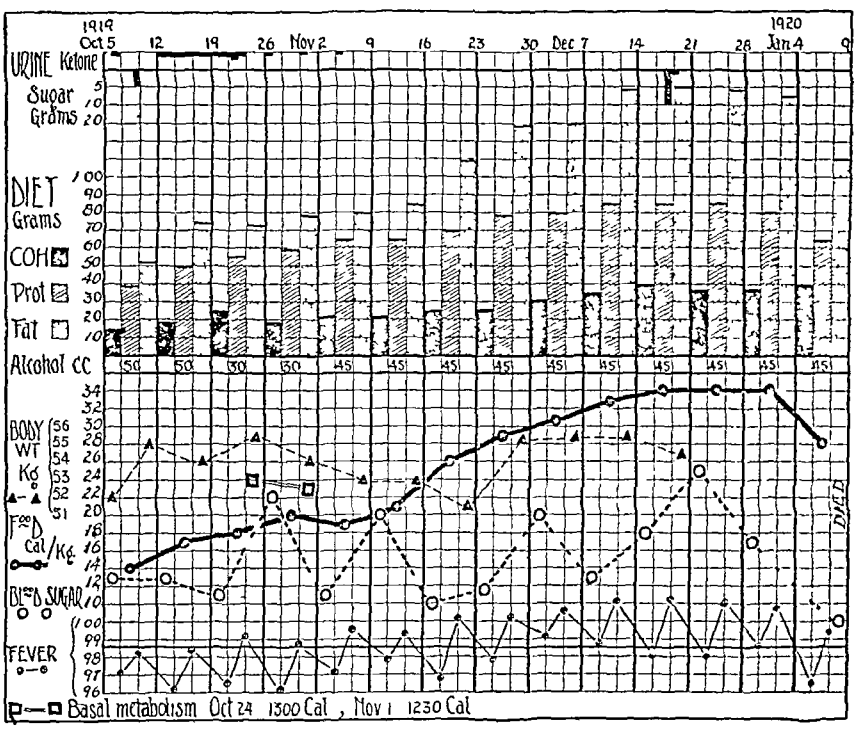

Chart 3 (Case 10)—Great increase in carbohydrate and food tolerance in last stages of tuberculosis Weight increase is due to edema Note fluctuations in blood sugar curve probably due to tuberculous intoxication

ADVISABILITY OF PERMITTING GLYCOSURIA IN A PHTHISICAL DIABETIC IN ORDER TO PREVENT DEVELOPMENT OF TUBERCULOSIS

Assent to this presupposes that it is possible to combat the tuberculosis by a diet in excess of the glycolytic power of the diabetic organism a diet which cannot be fully utilized The etiologic factor elaborated in this article namely that tuberculosis develops usually in the untreated diabetic showing sugar militates against acceptance of this view It seems then rather illogical to apply as a principle of therapy the same factor

which aided in the development of the disease to be treated If, indeed, we should at all permit our tuberculous diabetics sufficient food on which they show sugar, we should at least have some definite aim in view A criterion must be adopted We might demand a definite improvement of the tuberculous symptoms in a given time, let us say in one or two months of glycosuria There is only one example in our series in which conditions seemed to indicate such a course In Case 1, in which at one time there were present diabetes with mild acidosis, symptoms of gout, chronic diffuse nephritis, a bilateral extensive tuberculosis with pleurisy, and ascites, the patient was advised to take sufficient food for comfort, though a moderate amount of sugar was regularly excreted The patient was indeed more comfortable, but showed as would be supposed no improvement, and continued to the expected fatal termination Phthisical diabetics with fever and caseous chest lesions can usually eat, without showing glycosuria as much of a proper diabetic diet as they can digest without showing sugar or ketonuria In these cases the question whether feeding to the point of glycosuria may be permitted becomes unessential

Importance of Rest—The question here to be decided is whether rest is more essential for the tuberculosis than is exercise for the diabetes Our experience has shown that rest is just as essential for stilling tuberculous activity in a diabetic as it is in treating uncomplicated tuberculosis, whereas exercise can be dispensed with in the treatment of such cases without bad results from the diabetic standpoint All rules as regard graduated exercise in tuberculosis sanatoriums are equally applicable to the phthisical glycosuritic Inneed, it is proper that still greater than the usual precautions in this regard should be employed It is now our habit to keep in bed every patient with tuberculous diabetes exhibiting any suspicion of activity, until experience has demonstrated that his tuberculosis remains unaffected or improved by the diabetic dietary regimen Another desideratum is effected by bed treatment Exercise demands more fuel and puts more strain on an organism already weakened by a chronic infection A diet which during the stringent period of early diabetic treatment is sufficient both to control the glycosuria and to afford enough nutrition to combat the tuberculosis may be insufficient to meet the increased metabolic requirements of active bodily movement It is obvious that careful observation of the temperature, pulse, sputum characteristics and other minutiae of tuberculosis treatment must be rigorously carried out

Basal Metabolism—This was estimated in six cases of the present series with the aid of the Benedict-Carpenter apparatus In three cases of diabetes, with active tuberculosis sputum and bacilli, the metabolic exchange was found to be normal Apparently a balance was here struck between the tendency of an acute intoxication to elevate and that of diabetes with undernutrition to depress the basal metabolism, for the remaining three patients whose pulmonary condition was little active showed, as was to be expected, a reduction (from 15 to 37 per cent) of the respiratory exchange

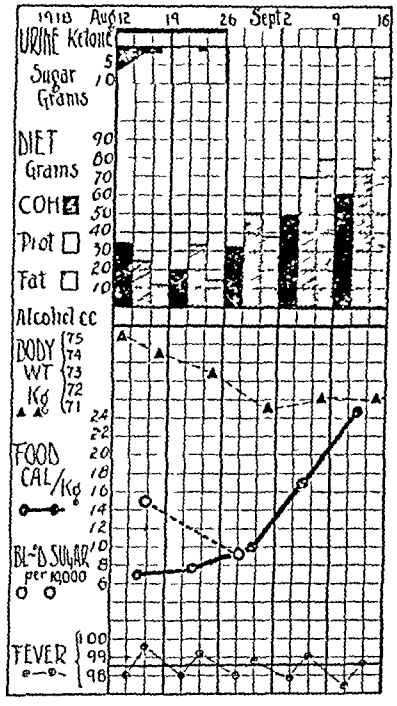

Chart 4 (Case 5)—Arrest of both tuberculosis and diabetes on treatment

SUMMARY

1 Data presented indicate that the untreated diabetic is more likely to develop pulmonary tuberculosis than when maintained sugar-free by modern dietetic methods

2 In a series of sixteen diabetic cases complicated by pulmonary tuberculosis showing activity, twelve patients definitely improved during a course of institutional treatment, diabetic symptoms disappeared in all but two cases, observed but a short interval Tuberculous symptoms improved in the majority of cases

3 Principles of treatment recommended are the judicious employment of sufficient undernutrition, combined with rest, to maintain the patient sugar-free and control the tuberculosis Fasting is unnecessary to obtain good results Ill advised fasting may lead to a fatal outcome Rest is at least as important as in the treatment of uncomplicated pulmonary tuberculosis

ABSTRACT OF DISCUSSION

DR FRANCIS M POTTENGER, Monrovia, Calif Dr Janney's paper emphasizes two points first, that the diabetic must not be allowed to develop active tuberculosis, second if he does develop active tuberculosis he must be cared for in the early stages of the disease Unless these two principles are regarded, the problem is a very serious one It is natural that a large percentage of untreated diabetics should develop tuberculosis It is recognized that latent tuberculous lesions exist in the lungs of a very large percentage of the human race and that whether or not these foci remain quiescent depends largely on the resistance of the patient Therefore, it can be understood that if the diabetes increases in severity it will lower the resistance and permit the tuberculous foci to become active So it is not at all surprising that a much larger percentage of untreated diabetics should develop tuberculosis than those who are treated properly I think we can safely conclude that if diabetics are treated in such a manner that their disease is held in check, a comparatively small percentage of them will develop tuberculosis The treatment of tuberculosis in the diabetic is a very serious proposition It is particularly serious on account of the feeding Undernutrition, if carried out for a long time, will undoubtedly hasten the tuberculosis On the other hand, if the steps necessary to the control of diabetes are not taken the tuberculous process will increase in severity The measures which help one apparently harm the other The prevention therefore, of the diabetic's becoming tuberculous is much better than an attempt to cure him after tuberculosis has developed

Rest should be adhered to very carefully as long as the tuberculous process is active, and, on the other hand, exercise is best for the diabetic patient In my experience in the treatment of tuberculosis I believe that the one factor that has added more to the chances of cure than any other is the principle of complete rest as long as the tuberculosis is active This is based on physiologic principles, as follows

A patient lying in bed, knowing how to relax, lives with the least expenditure of energy It takes 20 per cent more energy to sit in a chair quietly than it does to lie in bed It takes about 50 per cent more energy to sit in a chair and engage in active conversation than it does to lie in bed quietly, and it takes 100 per cent more energy to walk around than it does to lie in bed, and if the patient is working it will sometimes require three times the amount of energy that is required by rest Where it is necessary for the patient to live within his energy output, the factor of rest must always be considered The necessity of holding the tuberculous process in check is evident from the fact that as the tuberculosis becomes more active and the toxemia becomes greater the diabetes becomes worse, consequently, diabetes complicated by active tuberculosis is very apt to be an acute process

DR F M ALLEN, New York Diabetics have died from three main causes coma, tuberculosis and gangrene Treatment can nearly always prevent coma if begun in time, gangrene and other complications now still occur almost wholly on account of negligence because these conditions are almost wholly preventable What progress has been made concerning the combination with tuberculosis? In the Rockefeller Institute series this combination was encountered in three out of 100 cases, and general comparisons between strict diabetic treatment and an overfeeding policy turned out decidedly in favor of the former Other experience is in harmony with the points made by Dr Janney that the best treatment is undernutrition to the extent needed to control glycosuria and acidosis, that rest should be used in severe cases and only light exertion be permitted in the mild ones, and that more or less arrest of both diseases and particularly improvement in the tuberculosis and secondary infections of the lungs are thus obtainable Fasting must be used rigorously in some of the worst cases, even for a week or more continuously, and is preferable to continuance of glycosuria and acidosis In milder cases it is often avoidable, and a low calory diet, consisting of little or nothing but protein, is usually best for improving the diabetes by undernutrition while keeping up strength to resist the infection More than a year ago a young soldier was received in the diabetic service at Lakewood in the extreme stages of both diabetes and tuberculosis, and by rigid fasting and diet he became able to live six months longer with some actual freedom and enjoyment In milder cases the gain is correspondingly greater Nevertheless, these two diseases form one of the worst combinations possible When either the diabetes or the tuberculosis is at all severe the ultimate prognosis is hopeless For this reason the strictest treatment is seldom advisable, in particular, strictly normal blood sugar and completely negative nitroprussid reactions in the urine need not be insisted on

The prolongation of life by from six months to several years, particularly when it is attended by both increase and prolongation of comfort and usefulness, is a goal well worth while Most of us, however, are not prepared to treat these patients to the best advantage Most tuberculosis institutions lack the special dietary and laboratory equipment necessary for the proper management of diabetes As these combined cases are numerous either tuberculosis sanatoriums should provide themselves with the requisite diabetic equipment in charge of a medical and nursing staff trained in metabolism, or such patients should go to special institutions Dr Janney has the aid of the equable climate which attracts so many consumptives to California, and should be able to obtain optimal results The incidence of tuberculosis among diabetics before the days of diet treatment must have been numerous It appears that tuberculosis has diminished to a greater extent among diabetics than among the population at large, and that this diminished incidence is due chiefly to better treatment of diabetes Tuberculosis is generally superimposed as a complication on an existing diabetes, not vice versa, and it is the untreated or inefficiently treated diabetic who is so highly susceptible to tuberculosis Extremely undernourished and weak diabetic patients show no lack of resistance to most infections and perhaps, have an increased immunity to common respiratory infections Colds and grip at least are surprisingly infrequent among them They will probably continue to be slightly more subject to tuberculosis than the population at large, but thorough diabetic treatment is going to prevent an enormous number of cases of tuberculosis The same rule applies to the prevention of gangrene in the old and coma and tuberculosis in the young Either treat your diabetics thoroughly yourself or send them to somebody who will When general practitioners no longer allow elderly patients to go along with glycosuria year after year, and when they make early diagnoses in young patients and either send them to a specialist immediately or equip themselves to carry out accurate treatment, the suffering and deaths from all diabetic complications will fall to a fraction of the existing prevalence

DR WILLIAM C VOORSANGER San Francisco I am never without one of these cases It is the worst class of tuberculosis to treat, and although we agree that the diabetes is primary, nevertheless, the tuberculous institution gets the end-result These people come to be treated for tuberculosis, and the disease which is really killing them is diabetes The diabetes is naturally a disease of undernutrition, as tuberculosis is, but the treatment of diabetes requires undernutrition and the treatment of tuberculosis requires overnutrition The treatment of the diabetes combined with rest would unquestionably achieve greater results than any which we can accomplish in any tuberculosis institution, and I would be very much in favor of seeing a metabolic clinic suitably equipped, where these cases can be handled

DR. LOUIS J GENELLA, New Orleans The ease with which anybody can recognize tuberculosis in the diabetic has always impressed me I think the reason is that there are only two ways of recognizing tuberculosis in the chest One of them is by some sound transmitted either by or through some alteration in the hydraulics of the chest, whether in the rales or by other fluids in the chest. The other is by the recognition of the bacilli in the sputum Sputum is easily obtained from the diabetic If the tuberculous patients were able to furnish us from the base of the lungs a pint of sputum, we could detect tuberculosis in other diseases just as easily and just as soon and just as often as we do in diabetes

DR N W JANNEY, Santa Barbara, Calif An important point which may be emphasized is that the detection of cases of tuberculosis among diabetics is frequently made only by a careful history and physical examination We are too likely to take a short history, only directed to this condition, and abbreviate unduly the physical examination I am glad however to be able to say that a number of the cases included in the present report were detected in our clinic I wish to emphasize, also the matter of the instruction of these patients with regard to their treatment and the nature of their disease as influencing their mode of living I have been very much impressed, in the treatment of all chronic diseases with our laxity in this regard We should try harder to benefit such patients by teaching them diabetic cooking and the necessary restrictions necessitated by their tuberculosis The matter of sputum I did not touch on There is less positive sputum found in these cases than is usually the case in tuberculosis A few years ago it would have seemed foolhardy to attempt to apply the principle of undernutrition to tuberculous patients Dr Allen's studies have permitted us to do so with a fair measure of success

---

Need for Clinical Research—The present day conception takes too narrow a view of the field with which medical science has to deal It assumes that instrumental methods are of necessity the only scientific methods It has been assumed because recording and measuring instruments and other methods have greatly advanced such limited fields of medicine as physiology bacteriology and chemistry that therefore clinical medicine should adopt the same methods In medicine there are phenomena which the scientific instruments of today however delicate, can neither register nor measure and there are methods necessary for the investigation of disease which no laboratory experience can supply —J MacKenzie *Brit M J* **1** 105 (Jan 24) 1920

MISTAKES IN ONE HUNDRED THYROIDECTOMIES

WITH DESCRIPTION OF A NEW METHOD OF THYROID CAUTERIZATION IN TREATING EXOPHTHALMIC GOITER *

J TATE MASON, M D
SEATTLE

This series of 100 thyroidectomies for relief of toxic symptoms covers a period of eight years The series consists of fifty-eight patients operated on for toxic adenomas, with one death, and forty-two patients operated on for exophthalmic goiter, with five deaths During the eight year period the mortality attending surgical procedure has been markedly reduced This reduction has been largely brought about by a fuller appreciation of our earlier errors in judgment

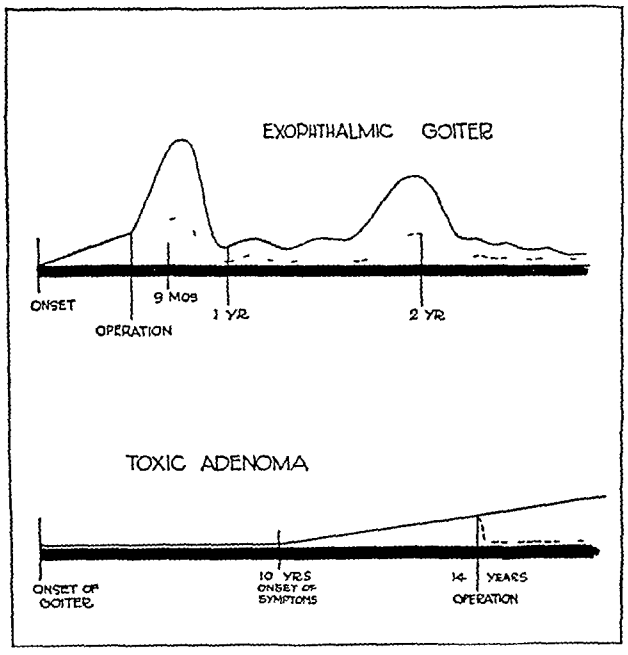

Fig 1 —Exophthalmic goiter Base line normal health curved line above, intoxication of patient who has not been operated on dotted line intoxication of patient following operation Toxic adenoma Base line normal health line above gradual increasing intoxication of patient dotted line, operation

TOXIC ADENOMAS

Toxic adenomas produce a sequence of symptoms somewhat different from exophthalmic goiter There is usually no sudden exacerbation such as characterizes exophthalmic goiter, but a gradually increasing chain of symptoms over a period of many years, the symptoms beginning years after the goiter is first noted Our histories show that the goiters were first observed in the teens or twenties and existed for several years at least before toxicity was observed

Substernal goiter was found in six patients, all showing thyrotoxic and pressure symptoms All these cases were adenomatous, which, with other studies, leads us to believe that all substernal goiters are adenomatous and sooner or later become toxic

Secondary operations were necessary on six patients because of recurring symptoms associated with considerable enlargement of that portion of the thyroid left at the previous operation Immediate improvement was noted following the first operation for a period averaging two years, then within a few months the symptoms became nearly as marked as before the first operation

Rest and medical treatment preliminary to operation should be undertaken in bad cases to get the patient into reasonably good physical shape After such preliminary treatment we remove most of the thyroid gland These operations can usually be done under morphin and local anesthesia The patients sit up on the third day and leave the hospital at the end of one week, provided the cardiac condition is reasonably good

Postoperative results were ascertained by inquiries sent out in January, 1920 More than half the patients answered All reported themselves cured or improved and as having regained their normal weight Their general health was vastly better, and they were all greatly pleased with the operative result In fact, there is no group of surgical cases in which the end-results are more satisfactory than in thyroidectomy for toxic adenomas Bad judgment was manifestly exercised as we look back at certain cases

In our fifty-eight cases only one was lost This death occurred in a Christian scientist who requested operation, but refused the preliminary treatment necessary to get her into good physical shape The poor judgment in operating under these circumstances was inexcusable

We operated immediately on a few patients who urgently needed preliminary medical treatment While only one death resulted, we have had some very stormy postoperative days that could have been avoided

In the first years we exercised bad judgment in not operating on a few extremely ill patients, usually because of bad hearts We now regard no toxic adenoma patient as too poor a risk to put at rest under observation, with a view to thyroidectomy Even the worst cases can usually be tided over a thyroidectomy If thyroidectomy can be performed there is great subsequent improvement in the patient's general and cardiac condition

Recurrence of goiter and toxic symptoms seems to indicate that we have occasionally removed too little of the thyroid, so our present tendency is to remove more rather than less *No bad results have followed this plan*

EXOPHTHALMIC GOITER

Exophthalmic goiter, with few exceptions, runs a typical course, as has been recently confirmed by Blackford in studying our cases Had we known in the early years the usual course of this disease, our mortality would have been lower

The typical case shows a slight thyroid enlargement with mild toxic symptoms, during several months The symptoms gradually increase until about the eighth month, when they become markedly worse During the ninth month there is an explosion of symptoms, commonly known as a crisis Then there is a period of improvement, with fairly constant symptoms At about the end of the second year a second crisis occurs, never quite so severe from the standpoint of toxicity as the first After this there are ups and downs until, after years, the toxicity of the goiter wears out and we have occasionally a cure, but usually a human wreck, suffering from cardiac and general degenerations

* From the Mason Blackford Dowling Clinic
* Read before the Section on Surgery General and Abdominal at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

Early in the disease it may be difficult to make a diagnosis of hyperthyroidism The basal metabolism rate will be of great assistance at this period, because it assures the diagnosis and enables us to urge surgical interference at the time when most benefit can

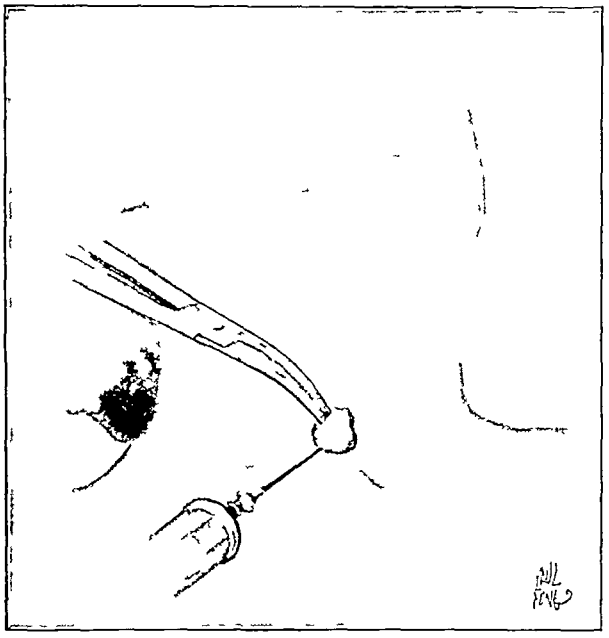

Fig 2—A piece of cotton is frozen with ethyl chlorid and held on the neck for thirty seconds A needle can be inserted under this without pain and without the patient s knowledge of what is being done

be secured The heart, liver and kidneys have not been damaged, the operative risk is good, the end-results are better than at any other time during the course of the disease

Unfortunately, if the patient is put completely at rest and given any medicine or none, there is a temporary improvement This temporary improvement, and the rapid improvement which occurs following the crisis, has caused many drugs to be considered specific, and much valuable time has been lost to patients because this improvement has been credited to the medicine Thus, good surgical risks have been permitted to become extremely poor ones Should the patient be allowed to go through the usual course of the disease, there is such marked change in the vital organs that it is impossible by surgical interference to secure more than a relative cure

The ideal time for operation is within the first six months The closer we get to the high wave of toxicity, the higher is the mortality and the larger the number of incomplete cures The patient operated on before the first crisis is eventually much better off than the one who is carried to and then through the crisis by medical treatment and operated on later However, the patient who is operated on early in the disease will have a slight wave of toxicity at the time of the first crisis, but the severity of this wave will be reduced in proportion to the fraction of the gland removed If four fifths of the thyroid has been removed, the subsequent crisis will be one-fifth as severe

In extremely toxic cases it is impossible to tell how much operative interference will be tolerated As a rule the patient's history and general condition, the pulse and pulse pressure and the metabolic rate give an index to the degree of intoxication But the shock or acute exacerbation of symptoms following operative procedure is not always as expected Sistrunk says that of two patients with a plus 50 metabolic rate and other findings about the same, one may stand thyroidectomy well, while the other will prove to be a poor surgical risk In other words, we have no accurate way of determining the amount of damage already done, although our findings on the present activity of the gland may be fairly accurate

Postoperative results have been reported by three fourths of our exophthalmic goiter patients They are all improved, and most of them feel that they are well Two are still marked cardiopaths A third is an inmate of a hospital because of degenerative changes dating back to the first high wave of toxicity These three exemplify the cases which we so often see following exclusive and persistent medical treatment, the hyperthyroidism has disappeared, but the degeneration of vital organs persists

Secondary operations have proved necessary on five of our exophthalmic goiters In these five cases there were remarkably severe reactions following thyroidectomy This observation, with other experience, leads us to believe that there is less reaction if a very large part of the gland is removed

Lack of judgment as to the best time for interference and the best type of operation on exophthalmic goiter has given us much grief—in fact, we feel that our most serious mistakes have been due to lack of a full appreciation of the dangers of the crisis of the disease and by attempting too much in extremely bad cases Three of our deaths, even now, appear to me to have been unavoidable, but the other two patients

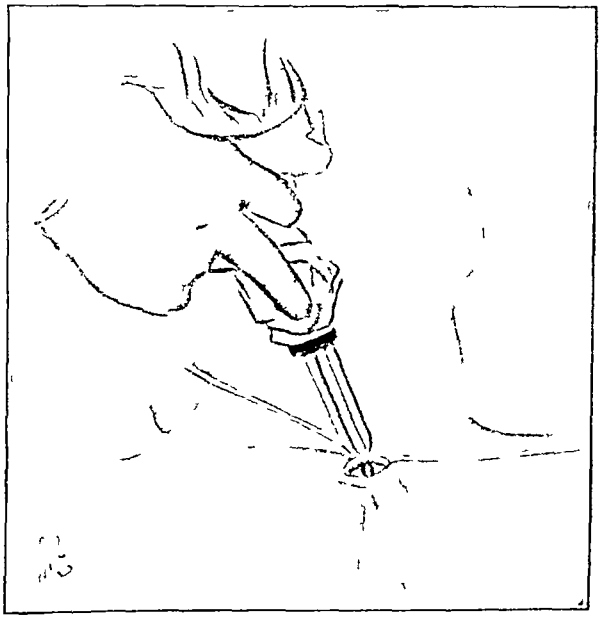

Fig 3—The skin platysma and fascia have been severed Separation of muscles with blunt scissors

would now be treated more conservatively While anxiously watching the first three days of a stormy convalescence, we have often wished that a less complicated operative procedure had been undertaken

In operative procedures in bad exophthalmic goiter cases we use little general anesthesia In all such

recent cases, operations have been performed under local anesthesia, a little ether occasionally being used when it becomes necessary to pull on the gland

There are a few patients who are such poor surgical risks that we wonder whether anything surgical can be attempted We have kept them at rest and under medical treatment until maximum improvement is attained, and then have depended on the injection of boiling water or ligation of one superior thyroid artery to secure further improvement

Injection of boiling water may give an idea of the reaction of the patient, but it destroys no portion of the gland Ligation will often precipitate a severe attack of hyperthyroidism There is almost always reaction, this is especially true following ligation The collateral circulation is unquestionably restored within a few days, which leads us to believe that the improvement following is largely due to an increasing immunity to the disease resulting from these high waves of toxicity

We all agree that the symptoms subside as soon as the gland is safely removed Then in these bad cases our ideal surgical treatment leading to thyroidectomy should theoretically destroy or remove a small portion of the goiter, with little or no reaction from the patient Theoretically, this removal or destruction of a portion of the gland should be painless, it should be very simple, it should give no reaction

Actual cauterization of the exophthalmic gland has been done during the last two years in a few cases, and has apparently approached this theoretically perfect surgical treatment It is so simple and so painless that it can be performed without the patient's being

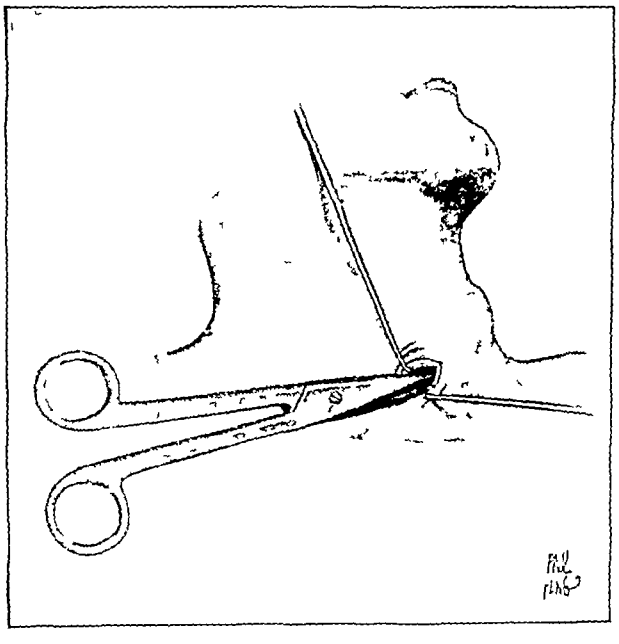

Fig 4—Cautery being applied to gland

conscious of what is going on Reaction has been negligible The results have been excellent

TECHNIC AND COMMENT

Local anesthesia is begun by pressure for thirty seconds to the point chosen for the first needle puncture of a cotton applicator frozen with ethyl chlorid Thus we are able to introduce the first needle without pain Careful infiltration with procain is then made in the usual manner An incision 2 cm long is made just to the inner side of the sternomastoid muscle, in the line where the thyroidectomy incision will later be made The skin, platysma and fascia are divided in the same direction, these tissues are pulled back with

Fig 5—Patient who has had three fractional cauterizations

small retractors, and the underlying muscles split with blunt scissors When the goiter is exposed, the retractors are inserted down to the gland By slight traction the fibrous capsule can be separated from the anterior surface of the gland, exposing the peritoneal-like membrane over a space the size of a dime The field is made dry Then an electric cautery, while cold, is passed through the incision down to the anterior surface of the gland The current is turned on and the cautery rocked slowly from side to side, a piece of gland about the size of a shoe button being destroyed, and causing coagulation of a much larger area No sutures are inserted, but two or three clips are used for closing the skin Petrolatum is applied to the outside of the wound to prevent the first dressing from sticking

There is usually a little muscular soreness at the first dressing, but otherwise we have experienced no local reaction There has been no hemorrhage, sepsis or sloughing, and there has been no unusual difficulty in performing subsequently a thyroidectomy

This procedure may be repeated every few days, destroying larger portions of the gland until the patient is considered a safe risk for ligation or thyroidectomy Further incisions are made 2 cm apart, care being taken to keep them in the same line as the future collar incision for thyroidectomy The usual collar incision later will manifestly obliterate all external evidence of the cauterization

In a few recent cases we have used the fractional cauterization in place of ligation If this method proves as efficient as it seems to be, it may enable us to do away with the reaction and unsightly scarring of ligation

Surgical mortality in exophthalmic goiter will always be higher than in other types of goiter, because of the nature of the disease Yet, by taking these patients through a series of minor operative procedures, it is surprising how many can be relieved without a death

For years it has seemed desirable that we destroy or remove a small part of the exophthalmic goiter gland in extreme cases, with minimum shock to the patient In a few cases our method has given results exceeding expectations We commend it to you to test and to pass upon

CONCLUSIONS

1 All patients suffering from toxic adenomas or exophthalmic goiter are surgical cases

2 Preliminary rest and medical treatment are essential to a low mortality risk in bad cases

3 Poor end-results are usually due to operation undertaken after the onset of permanent degenerations in vital organs

4 Fractional cauterization of the gland in bad exophthalmic goiter cases has proved efficient, either as preliminary treatment to ligation or in replacing ligation

---

DIAGNOSIS AND MANAGEMENT OF INTRATHORACIC GOITERS*

FRANK H LAHEY, M D
BOSTON

The following remarks are based on an operative experience with four completely intrathoracic adenomas of the thyroid, one large completely intrathoracic thyroid cyst, and sixty substernal or incompletely intrathoracic thyroid growths, varying in the depth of their locations from almost completely intrathoracic goiters to slightly substernal adenomas or colloid goiters

Fig 1—Course of deviated trachea (indicated by arrows) and intrathoracic shadow

It is my opinion that too little attention has been directed to intrathoracic goiter, which may be so satisfactorily operated on, and so plainly diagnosed, if its presence is recognized before its growth has reached proportions which threaten life by obstructing respiration, or preclude removal because of the extent of its diameters

Concealed thyroid growths occur as two types, namely

1 Those completely intrathoracic, in which no part of the goiter is visible or palpable, or in which just the uppermost part is barely palpable in the sternal notch

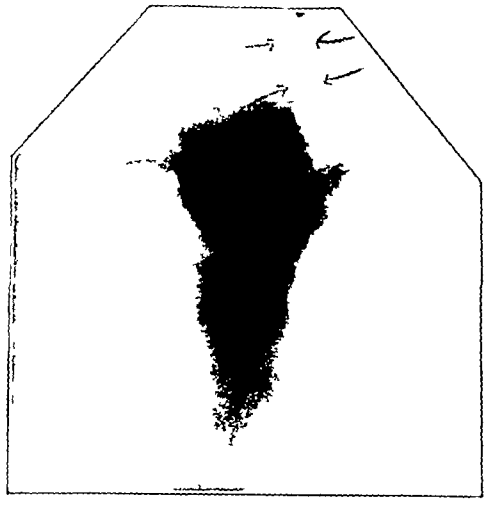

Fig 2—Course of deviated trachea (indicated by arrows) and intrathoracic shadow

This group is made up of adenomas or cysts of the thyroid

2 Those incompletely intrathoracic, in which the major portion of the goiter is on the neck, and easily visible, its lower pole being substernal, subclavicular or intrathoracic This type is made up of adenomatous, cystic or colloid goiter, and in connection with the latter (colloid), I wish to remark on the frequency, in my experience, of calcification in this type of enlargement of the portion situated within the chest

The location and anatomy of the thyroid gland are such that one would expect that all enlargements of the thyroid reaching any size would be directed downward in their growth, whereas, in fact, the growth of such enlargements is commonly directed forward

The influences that tend to direct the progress of growth in cysts, adenomas and colloid enlargements inferiorly are as follows

First, the enlargement is constantly subjected to pressure anteriorly by the anterior group of neck muscles—sternothyroid, sternohyoid, omohyoid and sternocleidomastoid It must be borne in mind that inferiorly no supporting structures offset the results of this anterior pressure, since the inferior boundary of the thyroid is the open upper thoracic aperture, so that when no antagonistic influences are present, such as adhesions of the growth to the trachea or attenuation on the part of this group of anterior neck muscles, the tendency must be seriously to influence the direction of growth downward

A further factor favorable to intrathoracic growth is that the thyroid and its contained tumor or cyst ascend and descend with swallowing, a condition which influences the tumors or cysts situated in the lower poles or in the isthmus of the gland constantly to mold for themselves a bed ever [illegible] downward

*Read before the Section on Surgery General and Abdominal at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

with the increase in size of the cyst or tumor In this connection, also, one recalls the fact that the deeper of the two anterior neck muscles, the sternohyoid, is inserted, not into the top of the sternum, but over the top and downward into the posterior surface so that it acts in a guiding capacity in directing growths from above downward within the thoracic cavity

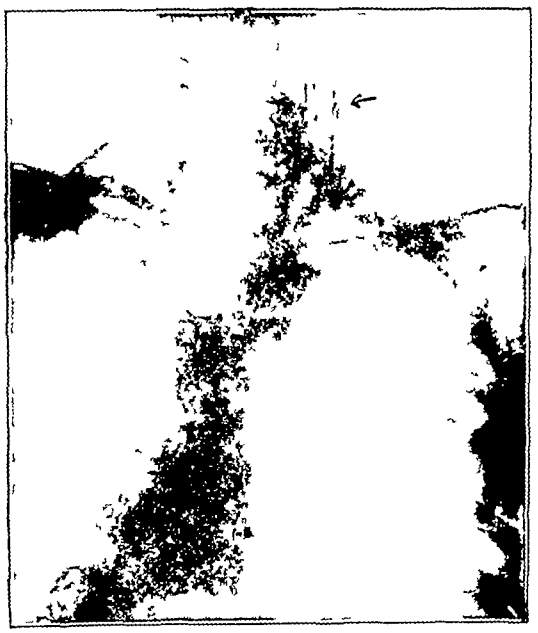

Fig 3.—Course of deviated trachea (indicated by arrows) and intrathoracic shadow Outline of trachea exaggerated by mark

The foregoing are the principal factors that influence the downward extension in certain instances of thyroid enlargements of the variety already mentioned, and these factors in large part bring about the condition spoken of as Group 2, incompletely intrathoracic goiters, or substernal or subclavicular goiters

Group 1 the completely intrathoracic goiters, however, require still another influence to bring about their development

An adenoma or cyst lying free in the thyroid, for example, is directed downward by the influences already spoken of, until it is a true substernal or incompletely intrathoracic goiter To become then completely intrathoracic, the diameter of the tumor itself must increase, and whether it becomes completely or but partially intrathoracic depends on whether the axis diameter is below the level of the top of the thorax, or above it If above, it will enlarge upward If below, owing to the fact that the thoracic cage narrows in approaching its upper aperture, as shown in the illustrations, with increase in axial diameter, there will be, because of the outflaring walls of the chest, a gradual descent of the tumor into the thoracic cavity This, I believe, is the mechanism of most cases of completely intrathoracic thyroid growths

If the foregoing assumptions are true, why is it that so few of the adenomas and cysts become completely or incompletely intrathoracic?

Two factors, already mentioned, play a large part in preventing this condition

The first factor is the great variation in the development of the anterior neck muscles, particularly the sternohyoid and sternothyroid One who operates frequently for hyperthyroidism—a condition of the thyroid which virtually does not affect this pair of muscles at all—cannot fail to be impressed with the apparent attenuation in these muscles in a great number of cases, and in such cases the important factor of anterior pressure must be largely lost Clinically, either as cause or effect, one frequently observes attenuation, and often almost entire fibrosis of the longitudinal muscles over the adenomas and cysts of the variety that has enlarged anteriorly

The other factor is the firm adherence to the trachea of many of the anteriorly enlarging types of thyroid growths, a clinical fact that all thyroid operators cannot fail to have observed—adhesions that are firm and supporting, and doubtless play a considerably antagonistic part toward the influences directing downward growth

As regards the evidence of intrathoracic goiter, this type usually reveals itself by various degrees of respiratory obstruction, dependent on the progressive growth of the adenoma or cyst It has been my experience, too, that periodicity of attacks of respiratory obstruction has been quite constant, and it is probably because of these periodic attacks of dyspnea that several of the cases of intrathoracic goiter have been treated for a long time, by various medical and surgical measures, for asthma The labored breathing that accompanies the attacks simulates asthma in that the respiratory effort is marked, but in no other way does it resemble it

Roentgen-ray examination demonstrates the substernal shadow continuous above, and as a distinct widening of the upper sternal shadow A feature that is of even greater diagnostic value is the bowing or deviation of the trachea, as shown by the roentgenogram This takes place when the adenoma or cyst grows from one side, but when it is bilateral in

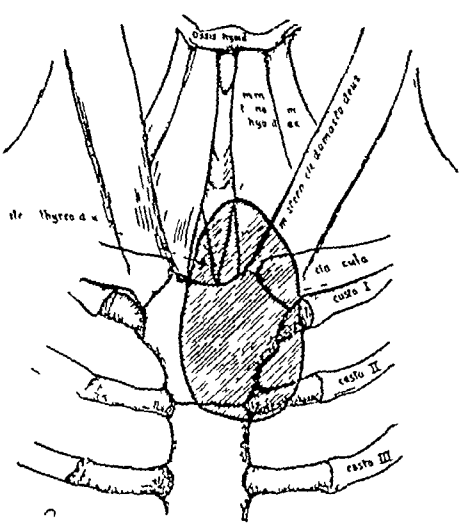

Fig 4.—Diagrammatic location of intrathoracic mass in relation to the sternum ribs and anterior neck muscles

growth—as occurred in one case—the trachea is then not deviated, but collapsed from before backward When deviation is demonstrated by the roentgen ray, there can be little doubt as to the existence of an intrathoracic growth On fluoroscopic examination, ascent and descent are of value in differentiating these from other mediasternal growths which do not move Since these growths are possessed of well-marked capsules,

one may often clearly trace the shadow of the capsule outlines, a blurring of which is said to create a suspicion of malignancy Clinically, this is to me a proved fact, as tumors of the thyroid whose lines of cleavage have been lost by fusion of their capsules with surrounding structure have in virtually all instances proved malignant in character

A late involvement of the recurrent laryngeal nerves, as evidenced by the late appearance of a husky

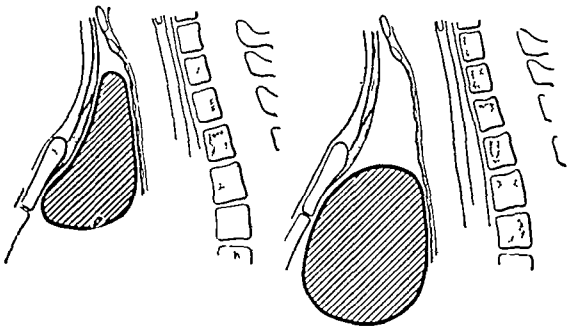

Fig 5 —Intrathoracic mass shown incompletely and completely illustrating how with increased diameter the upper pole of the mass is drawn into the thorax

voice, when the tumor has been present for a long time, is also a factor suggesting malignancy

Intratracheal examination by a trained laryngologist is of great value in the diagnosis of these conditions, as by this means deviation, narrowing or denting of the trachea from pressure may be demonstrated Not only in the concealed, but also in the incompletely intrathoracic type, this measure has been helpful in demonstrating pressure

Percussion dulness has been present in all of the completely intrathoracic goiters

In two of my cases, the upper part of the tumor was just barely palpable below the sternal notch, and this condition is, of course, conclusive evidence of the existence of an intrathoracic mass

It is assumed that surgery is accepted as the only curative procedure available in this condition, and my remarks in this connection will therefore be limited only to such points as have arisen in my own personal operative experience in dealing with thyroids of this variety

Perhaps the most essential single feature in the operative procedure is that the intrathoracic mass be delivered as a whole Piecemeal delivery is to be avoided because of the almost uncontrollable deep bleeding which occurs if the tumor is broken up while still located within the chest These intrathoracic growths are very vascular within their capsule, but if delivered intact they readily permit of vascular control by ligation of their more or less pedunculated blood supply Piecemeal removal is also to be avoided because of the possibility of leaving adenomatous masses behind, from which recurrent growths may develop

Since these deeply seated adenomas and cysts no doubt act as foreign bodies within the chest, they become surrounded by a layer of condensed connective tissue, which is of great value In the first place, it is most essential to remain within this tissue layer while freeing the tumors, as it forms a barrier against the extension of the infection which accompanies postoperative drainage of the resulting cavity Furthermore, it establishes distinct lines of cleavage, within which one must remain in order to prevent injury to the recurrent laryngeals and the thoracic duct Finally, penetration of this layer of connective tissue opens up the possibility of venous oozing within the thorax, resulting hematoma, and possible mediastinitis

The dissection of these completely intrathoracic masses must be by gently sweeping the fingers around the tumor within the lines of cleavage spoken of above Attempts should not be made to drag the mass out from above, but rather it should be pried out by pressure from below, when possible

With increasing experience with these deep-lying thyroids, one becomes impressed with the amount of force which it is possible to apply in prying these masses out of the chest

If all other measures fail, and delivery is impossible, because the diameter of the tumor is greater than that of the upper thoracic aperture, recourse may then be had to splitting the sternum—a measure which was necessary in one of those cases—by which wedges may be inserted, and the thoracic aperture so widen that delivery is possible It is a surprising fact that if dissection is gentle and within the lines of cleavage, enormous masses may be delivered with virtually no bleeding, since their blood supply enters from above downward, through the inferior thyroid artery and vein, which become elongated and stretched with the descent of the tumor mass, resulting after delivery in

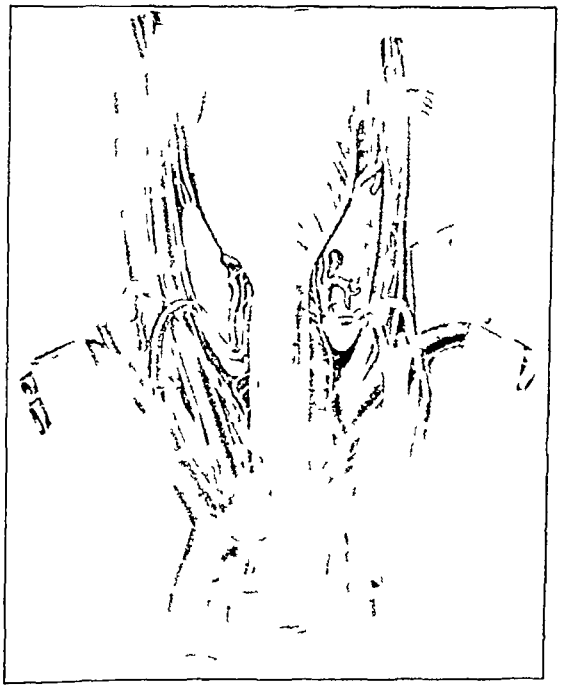

Fig 6 —Semidiagrammatic painting of a posterior dissection of the neck made at the thyroid level showing the length and course of the inferior thyroid artery which permits it to descend into the thorax with the tumor

a pedunculated tumor the tumor representing the portion which before delivery lay in the thorax and the pedicle representing the elongated thyroid vessels

The question of anesthesia in these cases is a trying one, since operation is often performed under conditions of complete or partial respiratory obstruction Of the five completely [illegible] goiters in my

experience, one was operated on as an emergency, with no anesthetic, one with a local anesthetic, because of almost complete obstruction, one with intratracheal ether, and two with gas-oxygen In all of the incompletely intrathoracic cases operation has been performed with gas-oxygen Of the five patients, four have made completely satisfactory recoveries The fifth died on the eleventh day of bilateral pneumonia

ADVANTAGES OF LOCAL ANESTHESIA IN THYROID OPERATIONS*

JOSEPH RILUS EASTMAN, M D
INDIANAPOLIS

The thyroid is one of the oldest and most generally recognized fields of application of regional anesthesia The risks of general anesthesia in such operations are serious and numerous Madelung and Socin, M L Harris, James Berry and many others have drawn attention to the advantages of local anesthesia in thyroid surgery Among the most important dangers of general anesthesia in goiter operations are (1) postoperative pneumonia, (2) overtaxing of the heart, (3) overtaxing of the kidneys, (4) increased danger through failure to block the sensory nerve paths, resulting in the needless consumption of nervous energy as explained by Crile, (5) injury of the recurrent laryngeal nerve, and (6) asphyxia of any degree

Advantages in respect of operative technic ascribable to local anesthesia are

1 More perfect hemostasis may be obtained through the use of suprarenal extract in nontoxic cases

2 Dissection of the skin flap may be performed more easily and more quickly, owing to thickening of the panniculus adiposus from inhibition of the solution

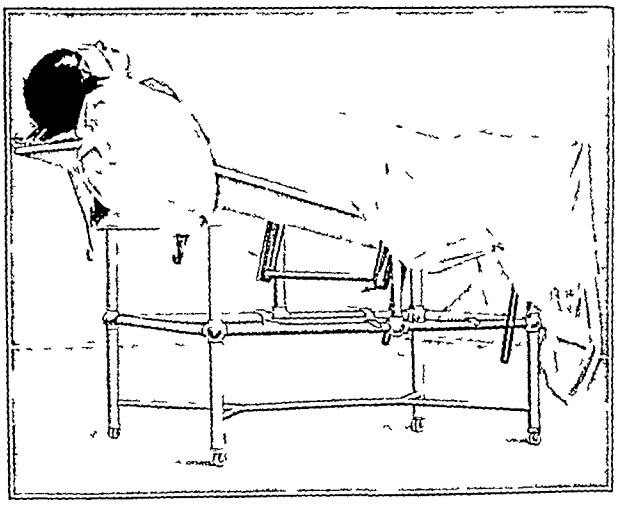

Fig 1—Safe and convenient inclination of operating table

3 There is greater facility of delivery of the gland, owing to the elevation of the lobes on the water-bed and thickening of the capsule

4 By conversation with the patient, the operator has a constant check on such exhaustion producing factors as pressure of instruments on the vital structures of the neck which cause discomfort, if not direct embarrassment of respiration and circulation with asphyxia

5 The patient can inform the operator at all times whether the head and neck lie comfortably and therefore correctly and safely

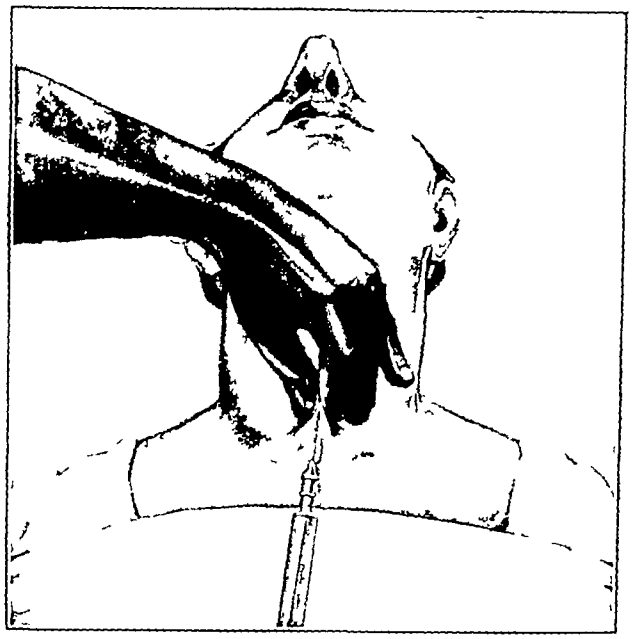

Fig 2—Simple method for making first introduction of small hypodermic needle almost painless blunting sensation by pressure

6 Local anesthesia enforces gentle manipulation of the tissues, minimizing pressure on the gland with its danger of overactivation of the heat, as proved by Cannon

7 Postoperative nausea, vomiting and strangling, with the attendant risk of bleeding, are practically eliminated

8 The patient can take liquids by the mouth immediately after operation, eliminating proctoclysis, which is annoying to excitable toxic patients

In a relatively small percentage of goiter operations, general anesthesia may present these advantages over regional anesthesia

1 There is complete relaxation and unconsciousness

2 Operation under general anesthesia demands the use of less gentleness and patience on the part of the operator than does regional anesthesia

3 The operation may be performed more quickly under general anesthesia

These are doubtful advantages The excitation incident to the induction of inhalation anesthesia is often greater than that which attends operating under local anesthesia Here the personality of the surgeon is of great importance One extensively experienced in the use of regional anesthesia will appreciate and utilize the hypnotic influence of the kindly caressing voice, the tranquil manner, and the attitude of frankness and decision which win the confidence of a timid patient The employment of regional anesthesia develops these qualities in an operator This, of course, is in the line of the anoci-association plan, with which the name of Crile is so honorably connected

The patient need know very little of what is going on, if a Kocher screen is used or the simple expedient

*Read before the Section on Surgery General and Abdominal at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

employed of placing a wet napkin of gauze over the eyes Then, too, the preparation of the patient for the induction of local anesthesia is important in this connection "The terror of the operating room, and the bad impression which the patient receives owing to the observation of everything connected with an operation are removed or at least considerably diminished if a mild narcotic be administered an hour before the operation is begun Thus the patient's cerebration is sufficiently blunted to external influences as to prevent further excitement"

Concerning the question of the amount of patience and forbearance which regional anesthesia requires of the surgeon, is it important that the tax on the surgeon is less with general anesthesia? If this is true, is it not fair to say that goiter surgery should be left to surgeons of patience and forbearance as well as technical skill? However great the virtuosoship of a surgeon in brilliant technical performances, he must lay great stress on the qualities of patience and cool judgment in goiter work

A great and worthy leader of American surgery said recently that he had no time to perform suprapubic prostatectomy under local anesthesia Should not the poor "prostatiker" with crippled heart and kidneys be turned over to one of reasonable skill who has enough time to provide the safeguard given by regional anesthesia?

Injury of the recurrent laryngeal nerve should rarely occur in local anesthesia The surgeon, talking with his patient, can know at once when this nerve is compressed or otherwise traumatized An interesting experiment under local anesthesia consists in producing hoarseness by compressing the recurrent laryn-

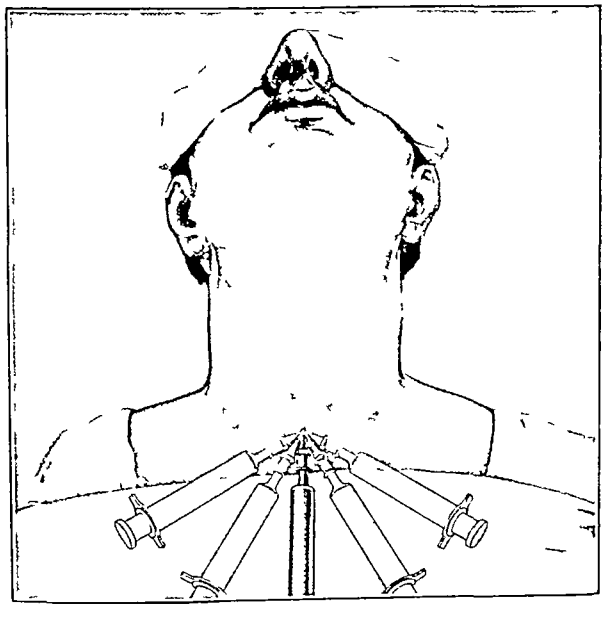

Fig 3 —Infiltrating all superficial structures through one puncture

geal nerve and relieving it at once on releasing the pressure Traction on the recurrent laryngeal elicits hoarseness and gives timely warning

Likewise in goiter surgery, the extra burden imposed on the lung, heart and kidneys by general anesthesia must be viewed with a due sense of its seriousness Suffice it here to quote Sistrunk, who says that in toxic cases, "with each crisis the damage to vital organs, especially the heart, liver and kidneys, increases until the patient finally suffers more from the symptoms produced by these degenerative changes than from the disease itself" Surgeons who have employed local anesthesia extensively are, I think, as a rule convinced that certain shock producing assaults on the cord or

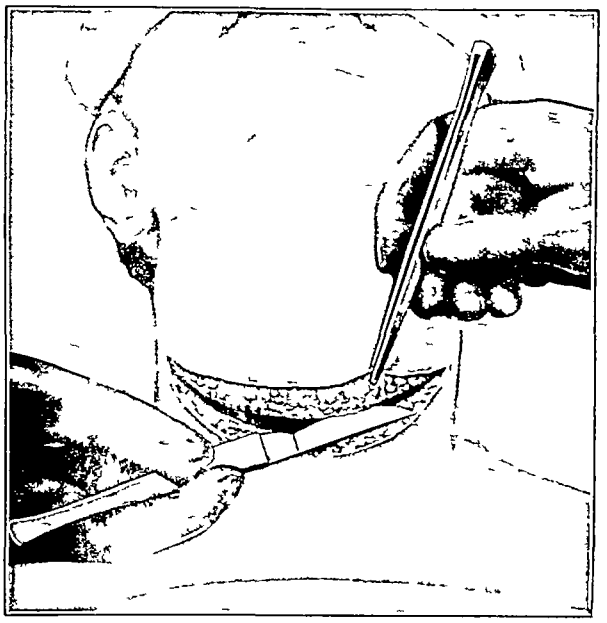

Fig 4 —Imbibition of panniculus adiposus facilitates dissection of flap

brain may be inhibited to a large degree by its use This is especially true if the patient is protected from frightful and irritating influences before and during the operation and if the pain centers are benumbed with morphin

After regional anesthesia, one does not observe the depression that follows general anesthesia Briefly, it seems fair to say now that accumulated evidence has established the value of regional anesthesia in the prevention of shock, which is of more avail than its treatment One need hardly reiterate that, in compliance with the theory of anoci-association, the prevention of pain after operation should receive interested attention

If the operating is done under regional anesthesia, the surgeon will be reminded that lying in one position on a hard table means discomfort and pain He will, perhaps be reminded by the patient, if it does not occur to him, that a pillow in the hollow of the back and a soft comfortable pillow under the head and neck have the effect of reducing the traumatism incident to the operation He will be taught respect for the nervous system of the patient, and will eventually make regular application of Crile's admonition that general anesthesia does not cut off the painful afferent impulses, but only inhibits their physical interpretation

It is quite well known that the addition of suprarenal extract to the procain solution in nontoxic cases not only lengthens the period of anesthesia produced by procain but also makes possible a much more complete control of hemorrhage Fewer artery clamps are required, and this is of importance since the pressure of clamps on the neck by their weight and traction may be the cause of the only discomfort felt during local anesthesia

In this connection it may not be amiss to recall the lessons of Kocher relating to provisional ligation in goiter operations Artery clamps should not be left on the neck during the operation without good reason No time is lost if the vessels are tied as soon as they

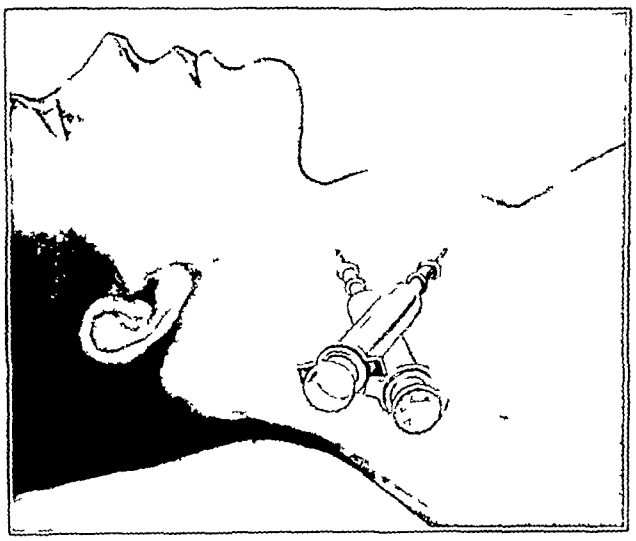

Fig 5 —Perineural anesthesia of poles

are grasped by the artery clamps They must be tied eventually, so why permit the wound to be cluttered with the clamps during the operation? The clamps which provide for bloodless division of the ribbon muscles can be removed after interlocking ligatures to the number of four or five on each side are applied under the clamp jaws If the ends of these ligatures are left long, they may be employed as retractors dur-

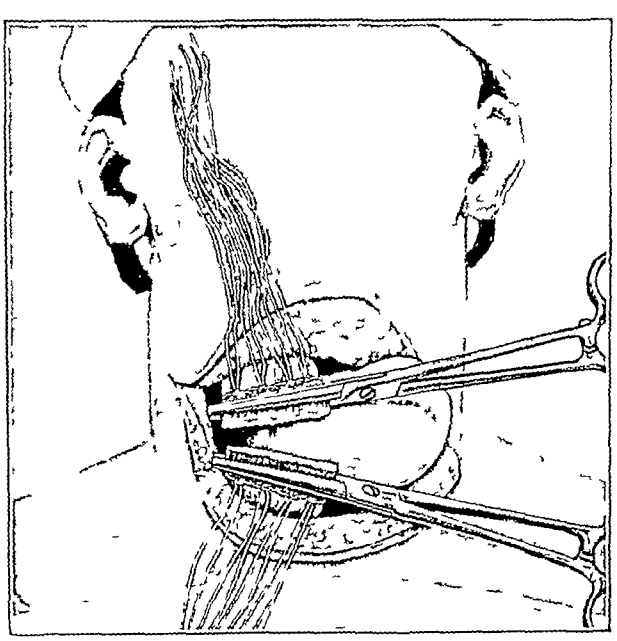

Fig 6 —Hemostatic sutures in ribbon muscles under forceps jaws make possible the removal of the forceps freeing the field of all clamps

ing the operation, and used to unite the cut edges of the muscles on completion of the operation

Ochsner admonishes that surgeons who are inclined to be violent in their manipulations should perform thyroidectomies under local anesthesia, with its enforced gentleness, since there is no doubt as to the likelihood of increased postoperative perversion of thyroid function if the tissues are severely traumatized

The loss of blood seems to have the same effect It is consequently wise always to clamp each vessel between two hemostatic forceps, cut between these and ligate In this manner the entire operation may be performed with the loss of almost no blood and therefore with greater facility The tissues at the close of the operation will not be saturated with blood, the absorption of which, according to Kocher, increases the likelihood of hyperthyroidism

It should not be embarrassing to the operator if the patient converses with him, informing him perhaps during the course of the thyroidectomy that traction on a lobe is producing dyspnea, or that the pressure of a hand or of the instruments is causing discomfort It is one of the valuable advantages of local anesthesia that the patient participates in the matter of protecting himself against unnecessary trauma

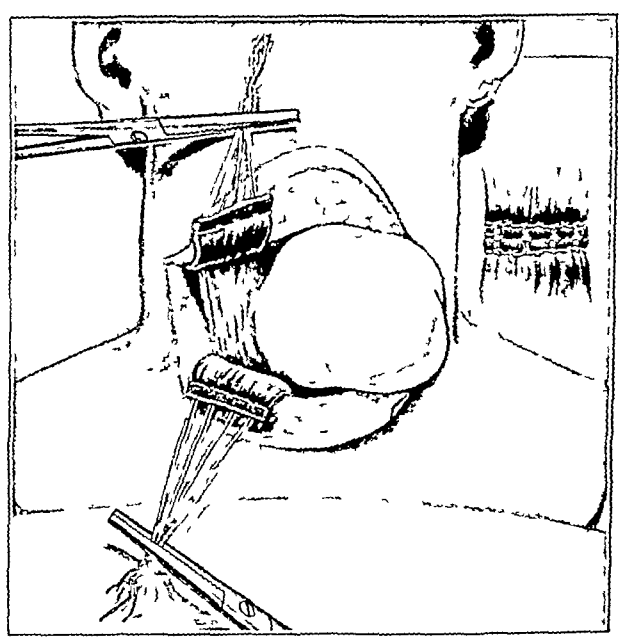

Fig 7 —Hemostatic sutures in ribbon muscles used as retractors

Local anesthesia makes its appeal to surgeons who are willing to consider all of these apparently slight factors of precision and gentleness, to proceed with the caution of a serpent and the patience of Job It is not a proper field of activity for those who still lay stress on the now discredited surgical showmanship

Very important is the positon of the patient on the operating table "Let the patient be the judge to tell us whether the head lies correctly It is not necessary to be guided by the stridor, the patient can say whether the neck is pressed upon or too greatly angulated" [1]

For what good reasons are the head, neck and trunk elevated in thyroid operations? Lowering the head augments the blood supply to the brain and also to the lungs and heart A position of slight elevation of the trunk, with the neck curving gently backward, is perhaps one of greatest comfort to the patient and of value for the vital reason that in this position the

1 Schwyzer Gustav Diagnosis and Surgical Treatment of Intrathoracic Goiter, J A M A 74 597 (Feb 28) 1920

heart and lungs are less liable to overtaxation Thus it is of importance that the patient can indicate to the surgeon that he or she is made panicky by an unfavorable position

If a 1 per cent solution of procain-epinephrin is injected copiously into the subcutaneous tissues and muscles, there will of course result a marked imbibition and thickening of the subcutaneous panniculus After becoming accustomed to this, the surgeon will not be disturbed in any way by this resulting imbibition, on the contrary, it renders the freeing of the skin flap more easy and more expeditious Likewise, deep injections at the upper and lower pole not only establish perineural or infiltration anesthesia in the painful areas along the sides of the larynx and trachea, but they greatly thicken the loose weblike fascia external to the capsula propria, which thickening really facilitates freeing and delivery of the lobes

Postoperative observation of the enormous material of the Mayo Clinic indicates that the degree of improvement that follows thyroidectomy depends to a considerable degree on the extent of damage to the vital organs at the time of operation If the damage to organs has been extensive, it is impossible to restore the patient to normal health Here again we are reminded of the great importance of protecting the heart, lungs and kidneys against overtaxation As a factor assisting in the restoration of the normal metabolic balance following the operation, it is here submitted that the use of local anesthesia offsets to some degree the effects of the increased metabolism by bringing up the rate of food intake in the first few days following the thyroidectomy The patient can take liquids or even house diets, beginning at once after the operation In dehydrated patients, water or other fluids taken by the mouth render unnecessary the

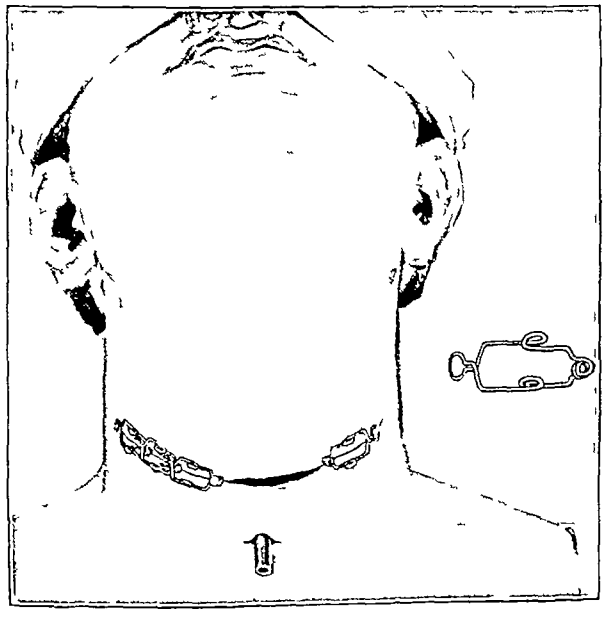

Fig 8—Herf clips close wounds quickly and precisely

employment of proctoclysis which in toxic thyroid cases, is as a rule more or less exciting

If the patient is not permitted to take too much water by the mouth during the operation there is little likelihood of vomiting either during or after the thyroid operation and this is of practical interest as postoperative bleeding is as a rule due to postoperative vomiting and strangling

Thus it is seen that the elimination of vomiting and the administration of food by the mouth immediately after operation have a bearing on the important question of metabolism In conclusion, it may be said that, whereas one perhaps should not take the supercilious position that those who do not succeed with regional anesthesia in thyroid surgery fail because of lack of skill or understanding, it may nevertheless be fair to say that considerable experience must precede efficiency in employment of regional anesthesia, that the use of suggestion or hypnosis secured by an appropriate personality on the part of the surgeon and proper environmental influences is desirable, and that much caution and patience on the part of the operator are indispensable

AN EMERGENCY TECHNIC FOR THYROIDECTOMY*

WILLARD BARTLETT AM, MD
ST LOUIS

The admirable Halsted technic, based on anatomic grounds, or some modification of it has up to the present been employed whenever a thyroidectomy has seemed indicated It has fulfilled all requirements when the patient has been carefully chosen, with an assured margin of safety, still, a number of operative experiences during the last year have shown me that the indications for thyroidectomy may be very considerably broadened by the employment of a technic which is based on pathologic principles and is calculated to make the minimum demand on the patient's strength To this end, one waives every consideration of a cosmetic nature (although it may be stated in passing that the visual end-result is not so bad as to disappoint greatly the patient, especially if he is a man who wears a collar of ordinary height or a woman whose matrimonial question has been settled) the sole

* Read before the Section on Surgery General and Abdominal at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

aim here being to destroy the greatest amount of thyroid tissue possible, which could not be accomplished without risk to life if done in the usual manner

This may, then, for want of a better expression, be termed an emergency technic 1 It contemplates the

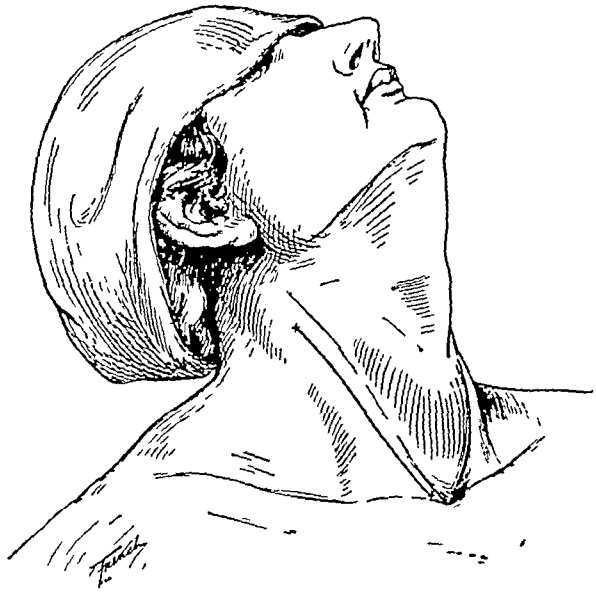

Fig 1—Site of intended incision marked before infiltration is commenced

most direct, rapid and bloodless approach to the tumor 2 It prevents the tissues being contaminated by toxic thyroid juices 3 It saves the time ordinarily spent in ligating vessels and in closing the wound 4 It eliminates the accidents which not infrequently cause loss of blood while ligating the numerous vessels divided It naturally follows that shock is rendered unlikely, because, as will be seen, the operation is short, the efferent nerves are blocked, and very little retraction is necessary Likewise, postoperative hyperthyroidism is not to be expected because absorption cannot take place, the wound being left wide open (absorption, of course, is only a partial explanation of postoperative hyperthyroidism) This phase of the subject, however, cannot lightly be dismissed by one who has seen postoperative temperature invariably drop when fluid was found secondarily in cases in which no change in the central nervous system had become manifest

In the past, the great danger of thyroidectomy for toxic patients has consisted in our doing too much and thus bringing about a fatal postoperative toxic condition In consequence, we have gradually been driven to primary ligation for most of the serious cases In these cases, then, it may not be out of order to attempt primarily a form of thyroidectomy, the gravity of which has been reduced to something like that of ligation Speaking in general, in the past we have divided our patients into three classes (1) the safe risks, (2) those who were rejected, and (3) the doubtful class which contains most of our unpleasant postoperative surprises Nothing need be said here about the first group, those that are definitely fit for any form of operation, or for the second, on whom no one would do more than a ligation, if even that But this emergency technic is intended for the doubtful patients who seem too good for ligation, but in whom no positive guaranty of safety can be given after a classical thyroidectomy has been done No less an authority than C H Mayo says that ligation is of value only in the exophthalmic hyperplasia type with demonstrable vascular disease, hence the toxic adenomas indicate a thyroidectomy only, if operation at all Many of these patients are so ill that the classical Halsted operation is highly dangerous to them

The preparation for operation does not vary materially from that generally used We rest these patients, feed them, try to improve the failing circulatory apparatus, and ward off an impending acidosis by the administration of morphin and fluids No operation of any kind is justified in a person with persistent vomiting

As soon as the patient has reached the maximum of improvement and becomes sufficiently well acquainted with the surgeon to exhibit any degree of confidence in him, she is taken to the operating room, in full possession of her faculties, without any preliminary morphin for fear of vomiting on the table, the head of the table is slightly elevated, and the face is turned away from the operator The site of the intended incision is now marked (Fig 1) just behind the anterior border of the sternomastoid, care being taken not to run down within 1 cm of the clavicle (Fig 2), else an ugly scar will result

A diamond-shaped area is infiltrated about the growth through two needle punctures (Fig 3), one at each end of the mark just mentioned It suffices to infiltrate the subcutaneous fat and the muscle planes with 0 5 per cent procain As such a patient must under no circumstances be kept lying long on the table, it is well not to wait for a nerve block, but to infiltrate the skin where marked and proceed with the operation just as quickly as possible after she is placed in position

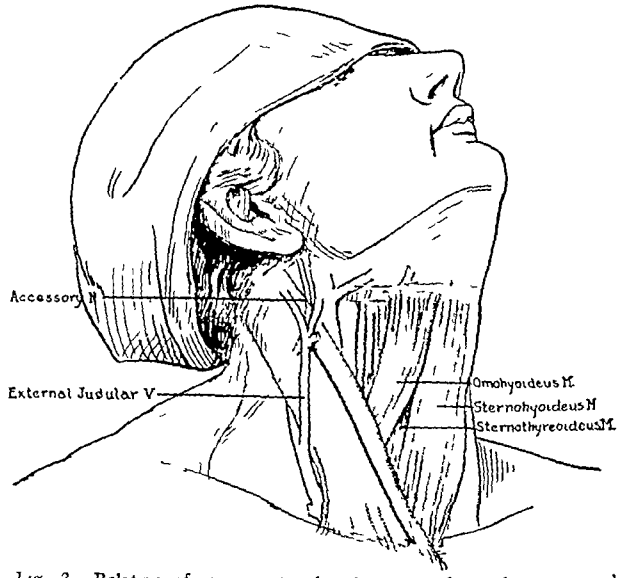

Fig 2—Relation of incision to clavicle external jugular vein and spinal accessory nerve

This form of incision has a number of advantages It allows one to approach the tumor by the most direct route, it encounters vastly fewer vessels than does the "collar incision," it avoids the extensive separation of tissue planes as contemplated in making the Halsted flaps, it is in a line with the axes of the important deep structures, it obviates retraction to a very considerable extent, and it insures that the resulting ridge-

like scar will lie on a preformed prominent ridge, namely, the sternomastoid muscle

As soon as the skin incision has been made, sutures (Fig 4) are introduced to be tied later, and then held out of the way by an automatic spreader (Fig 5) which engages in the angles of the wound

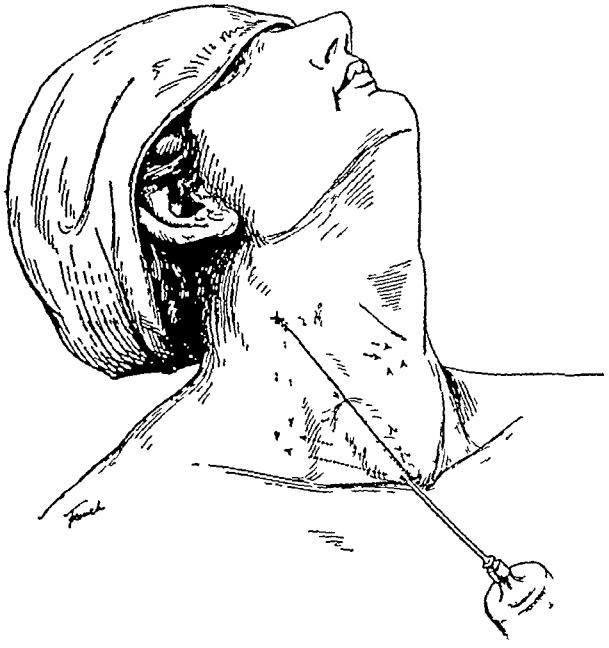

Fig 3.—Infiltration in two planes about tumor also the skin in line previously marked

The platysma incision corresponds with that in the skin, this unimportant muscle being the only one whose fibers are divided in any but a line parallel to them After gentle retraction (Fig 6) of the lower sternomastoid outward, and of the opposite upper wound lip inward, the ribbon muscles are split longitudinally (Fig 7) over the most prominent portion of the growth below (Fig 8) It will usually be found that the upper pole and superior thyroid vessels lie directly under the upper angle formed in the divided ribbon muscles, thus greatly facilitating the further progress of the operation It will be noticed just here that the gentlest possible retraction gives all the room for approach that is needed, quite contrary to the experience that all of us have had when operating through a midline ribbon muscle incision

The exposed lobe is now caught with two or three light intestinal clamps and gently lifted At this point the whole defect is flooded with alcohol (Fig 9) to seal up all tissue spaces against absorption of toxic material to be liberated in amputating a moment later As a further guard against this accident, we often pack the furrow around the gland with a roll of dental cotton, provided there is room enough, which is by no means always the case

The upper pole is now divided (Fig 10) and the lobe gently drawn toward the angle of the jaw, while capsule and goiter substance are divided after clamping from above downward (Fig 11) In this way it becomes surprisingly easy to slip out the lobe gently with the minimum of work about the lower pole and without roughly luxating the gland with the finger, provided there is no outspoken parathyroiditis By working in this way, the procedure is rendered practically bloodless and the patient disturbed not at all

In some instances the stump has been cut off with the cautery, thus destroying thyroid juice as liberated, and at the same time sealing over denuded surfaces It must be admitted, however, that this may be an unnecessary refinement

None of the clamps on thyroid substance are ligated in order to reduce tissue necrosis to the minimum No attempt is made to whip over the cut thyroid surface, fearing retention of toxic products and consequent symptoms In other words, *all of the clamps are left on the stump* (Fig 12), although in most instances we have ligated the few which were required to control bleeding from the other subcutaneous structures In one instance a total of fourteen clamps was left in place, in another, twenty-six in another, thirty-four, and in one other still a larger number of which no count was made The instruments we employ are the lightest that are adequate, namely, the clamp designed by Dr Halsted, and used commonly in his clinic at the Johns Hopkins Hospital The instruments are bunched together by a mass of dressing wrapped about them in such a way as to bring pressure to bear on the skin of the neck, and on their handles (Fig 13), thus tending to lift their weight upward instead of allowing them to rest on the floor of the defect The whole bundle is now covered with cotton, and a bandage applied around the neck and under the arms

It goes without saying that a wound held open in this manner cannot possibly retain the fluids forming in it, hence the most complete drainage is secured The patients who have been operated on in this way have complained of sore throat in just about the measure we see it in other forms of lobe resection I will say that they almost universally have difficulty in

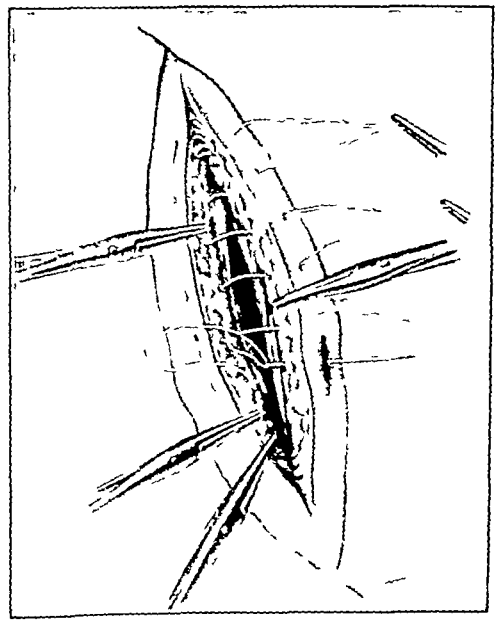

Fig 4.—Introduction of skin sutures

swallowing until the moment when the clamps are released then they are suddenly freed from this minor discomfort It will be recollected in passing that many a person whose neck has been sewed up in the ordinary way swallows with difficulty for a day or two Postoperative and pain rot the removal

instances was packed in the spaces left between the clamps It is therefore deemed inadvisable to use any packing at all when the clamps are left in place

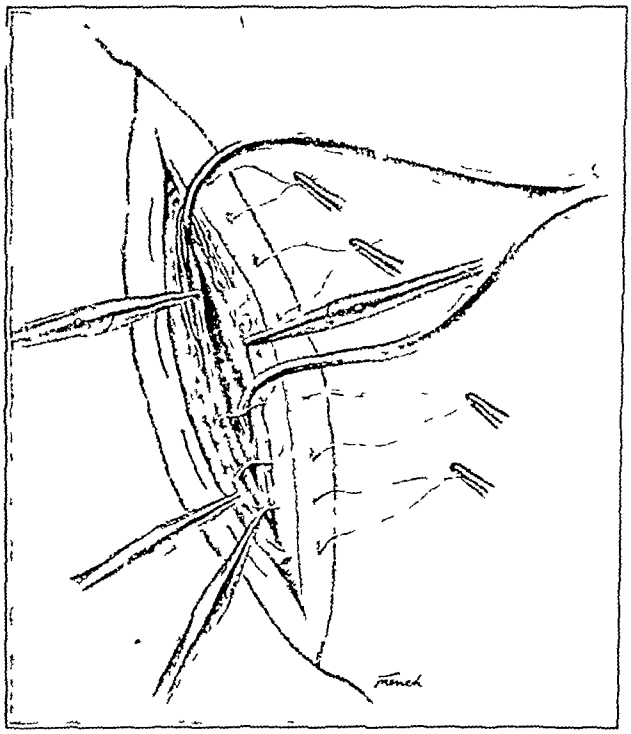

Fig 5—Sutures held out of way by automatic spreader

The after-treatment consists in giving one-half grain of morphin (the tolerance of these patients is always high on account of high metabolic rate) on leaving the table, so that severe after-pain may be avoided It is customary to repeat this dose as often as the

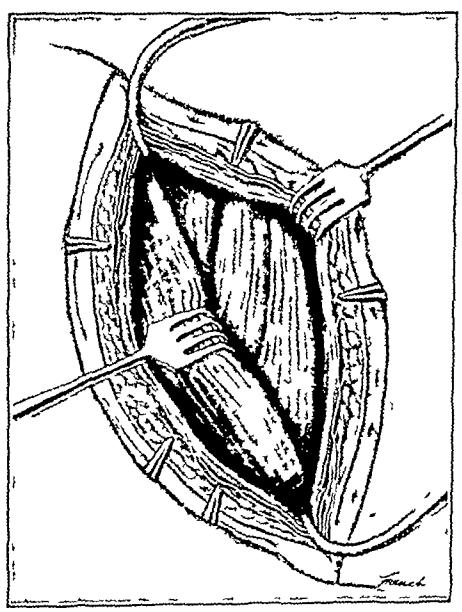

Fig 6—Retraction of sternomastoid to expose ribbon muscles

patient's respiration goes over 20, else restlessness may have the effect of wearing out a damaged heart We have used Crile's ice pack, applied on a rubber sheet over a thin cotton blanket, laid on the patient's right dress This invariably reduces a high temperature at about the rate of 2 degrees an hour, and does much to decrease restlessness We have for many years been in the habit of turning an electric fan directly on all of these perspiring patients, with very much the same result as one gets from the ice pack, having been under the impression that the metabolic rate increases about 10 per cent with each degree of fever *When there is vomiting or inability to swallow*, water is always pushed in the form of hypodermoclysis

The original dressing should not be touched until the postoperative storm, if there be one, is over Strange to say, these patients do not complain of the weight of the clamps, at least they have not complained up to a number of Halsted clamps as high as thirty-four, hence there is no reason to touch them during the first twenty-four hours when, if the patient is quiet, it is our custom to unlock all but those on the superior thyroid and let them fall off in the next few hours by virtue of their own weight This causes no

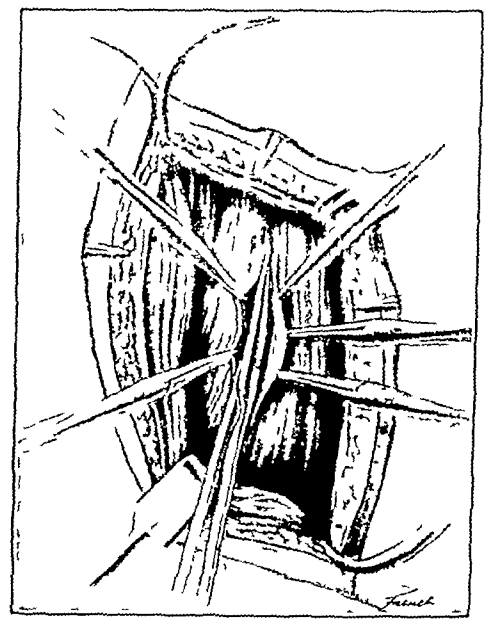

Fig 7—Ribbon muscles split longitudionally

discomfort, provided it can be done with the utmost gentleness The wound is usually found full of serum, when the clamps are removed This is expelled by tissue shrinkage, which follows the removal of the instruments, and the defect is practically obliterated when the skin stitches are tied at the expiration of the second twenty-four hours Some little discomfort always attends this act, but it is distinctly less than that caused by the application of skin wound clips, however, no local or other anesthesia has ever been required at this time One is surprised at the expiration of forty-eight hours to see how little need there is for any form of skin closure The application of adhesive plaster would answer all requirements were it not for the tendency that the lips of such a skin wound show to roll inward

It will be noted that the operation is over as soon as the lobe has been amputated, a fortunate circumstance when it is recalled that the resistance of a toxic patient under local anesthesia is about gone when this stage of the thyroidectomy has been reached This practical observation tends to discount the fact that it is *the-*

orctically far from ideal to leave a large number of clamps in any surgical wound One who entertains the idea for the first time might be justified in thinking of shock, postoperative discomfort, possibility of infection and cosmetic deficiency In practice, the procedure has not worked out thus, on the contrary, the operation has been greatly shortened, perfect drainage has been secured, and there has been none of the hemorrhage that occasionally complicates the tying-off of many clamps In some instances the undertaking is much better borne than was anticipated in the beginning and one is justified in going further and ligating in the ordinary manner, then packing the defect with gauze or with soft rubber, which we consider better However, the gain is very slight, excepting so far as surgical traditions are concerned The longitudinal slit in the ribbon muscles tends to close spontaneously as soon as their function is exerted The sternomastoid slips forward to cover the defect in

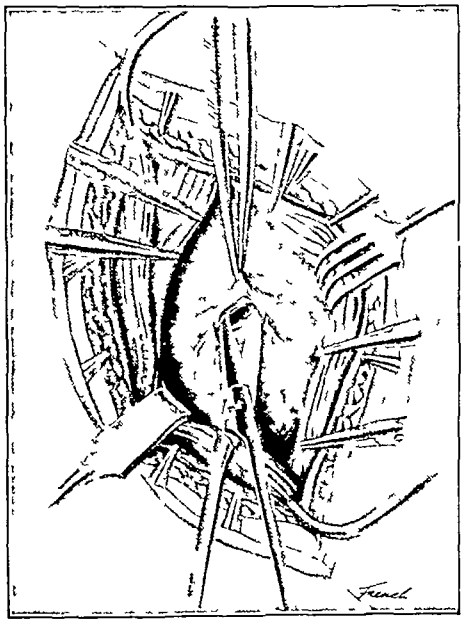

Fig 8—Tumor exposed

them, the thin platysma defect can be disregarded while the skin is closed well enough for all practical purposes by the tying of the few sutures which were introduced at the operation and left long for that purpose

Limitations on time and space prevent one's going into details of clinical histories I can state, however that the early postoperative period has been rendered so comparatively free from toxic symptoms by this technic as to make one feel justified in resecting one lobe on a considerable percentage of patients who were formerly not thought able to bear the operation as performed in the commonly accepted manner

ABSTRACT OF DISCUSSION

ON PAPERS OF DRS MASON, LAHEY, EASTMAN AND BARTLETT

DR HENRY S PLUMMER Rochester Minn Dr Lahey's general analysis of the goiter situation was in line with my views A basal rate of plus 15 or 16 can be accepted as meaning that the case is one of hyperthyroidism with adenoma That does not apply to exophthalmic goiter The risks of goiter are evident largely in the case of patients who have been hyperthyroid for more than a year We must learn not to wait until the patient is a bad surgical case before we

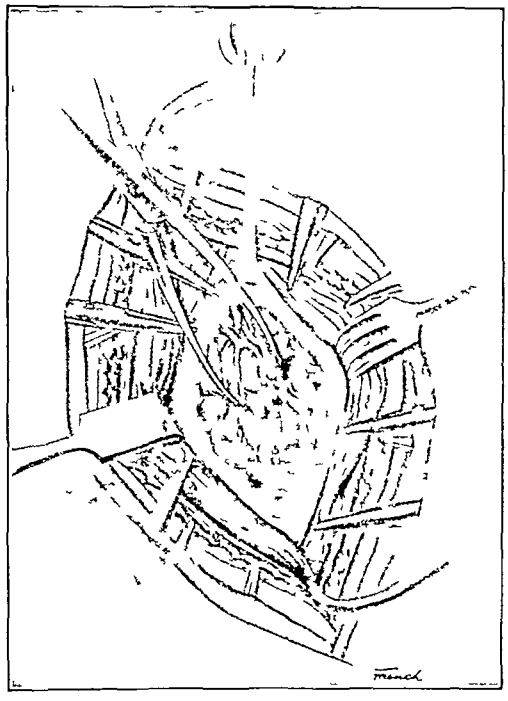

Fig 9—Defect flooded with alcohol to seal up tissue spaces

operate Sixty-five per cent of the cases come to us in the first year A relatively small percentage of the mortality comes from that 65 per cent Postoperative reaction,

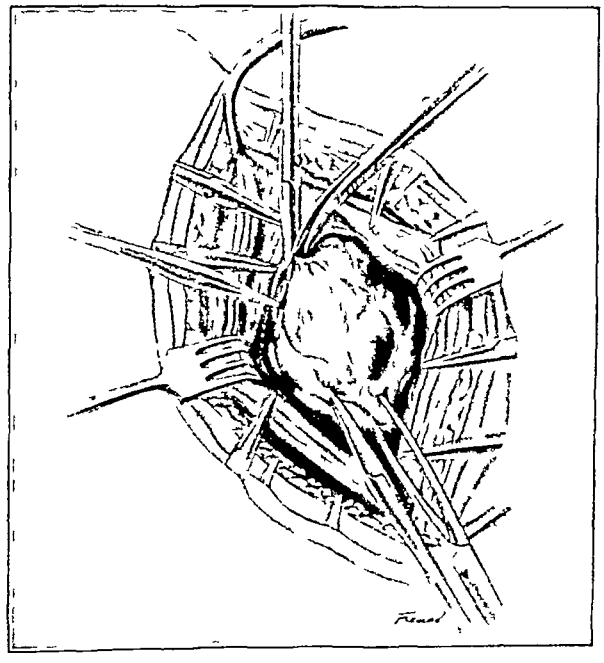

Fig 10—Upper pole divided

the so called postoperative thyroidism raises the question whether a patient can stand this sudden discharge of thyrotoxins into his system We do not even definitely know the crucial point on which this postoperative reaction depends

Until we do know that, we will not know the line of attack which will bring the highest benefit

DR EMIL GOETSCH, Brooklyn Dr Mason brought out some interesting points with regard to partial reduction of hyperthyroidism I should like to know why he prefers the

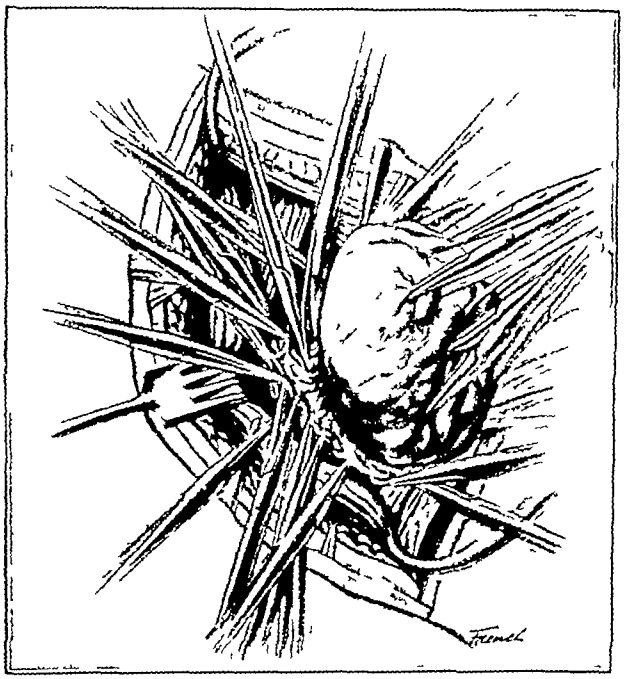

Fig 11—Stump divided from above downward

repeated use of the cautery instead of ligation The theory of partial reduction of hyperthyroidism consists largely in the destruction of gland substance or in reduction of its vascularity After all, secretion of the gland depends on its blood supply I cannot quite see why it is preferable to redevelop the operations which are more mutilating I think that repeated cauterizations are less advantageous than single quick ligations With regard to the neatness of ligation, I have never been able to convince myself that the cautery is preferable Dr Lahey has called attention to the very definite aid which the roentgen ray affords in the diagnosis of adenoma cases I have made use of the roentgen ray in some cases and have been able to confirm our suspicions that a deep adenoma was present With regard to the origin and mechanism of these intrathoracic growths which he mentioned, occasionally a growth of this kind seems definitely to have its origin in accessory thyroid tissue In certain instances there is no connection between these growths and the thyroid In one instance its structure was the same as a demonstrated accessory thyroid at a higher level in the neck The new tumor had an independent blood supply It is well worth remembering this possible origin of these accessory tumors In one case of acromegaly a large colloid goiter originally was situated in the neck, but with the enlargement of the shoulder girdle, this tumor descended into the mediastinum and was not even palpable above the jugular notch If the psychic element in thyroid operations is so important, particularly in exophthalmic goiter, as claimed by Crile, I cannot understand why one should resort to local anesthesia in exophthalmic goiter cases in which procedure the psychic element certainly is present to disturb the patient I have repeatedly noticed a preliminary pulse rate of 140 or 160 fall to 110 or lower under the anesthetic and remain so during the course of the operation This is evidence of considerable value to show that as far as the stimulating effect on the pulse is concerned the patient is apparently better off under a simple general anesthetic than under a local anesthetic As far as the pulse may be considered an index of toxicity, there is less of the latter under nitrous oxid-oxygen anesthesia than when a local anesthetic is employed

DR EDWARD G JONES, Atlanta, Ga If some medical men are inclined to discredit thyroidectomy and to criticize early operators in this field, they ought to keep in mind that these pioneers had to grope their way carefully to discover the proper margin of safety These early operators were justified in their caution to remove too little rather than too much thyroid tissue, so that if they had to operate on some patients a second time this circumstance is not a reflection on their judgment I have never seen a patient who suffered from having had too much thyroid tissue removed at operation, though I am well aware that there is a line of danger, and that such a statement ought to be made with circumspection Patients have not come back for so-called recurrences It is true that in some patients I have left one side because it seemed bad judgment to tax them with a double resection These patients ought to have had a second operation, but usually declined it because of the improvement gained from the one sided operation Dr Bartlett's procedure is a commendable effort to provide one more way of handling satisfactorily the class of patients for which he recommends it It is doubtless true, as he says, that this operation does some violence to cosmetics, and is a little iconoclastic as to the traditions of surgery, but we must remember that the individual under consideration is not much concerned about a scar in the neck, and takes only an academic interest in the traditions of surgery Anociation should begin the very first time the patient comes under observation, and be continued throughout the whole care of the patient Goiter is relatively rare in the South The incidence in the colored race is undoubtedly smaller than in the white race. A nontoxic goiter does not usually compel an individual to consult a physician, and the negro does not do it One third of our colored patients had exophthalmic goiter

DR A J OCHSNER, Chicago You will find a great deal of satisfaction in following the advice that Dr Bartlett has given in a certain series of cases similar in character to those which he has described Most of you will share his doubt about the wisdom of leaving on the clamps The amount of shock avoided by the few moments of taking off clamps will

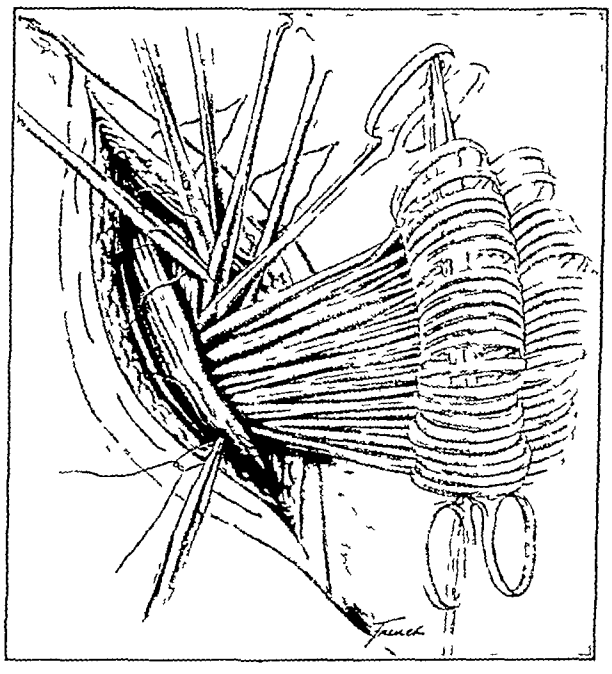

Fig 12—Clamps left in place on superior thyroid and stump

usually be greatly multiplied by the annoyance of leaving them on We have compared hundreds of cases operated under local and general anesthesia, and, as a rule, the patient operated on under local anesthesia is less badly off on the day after the operation than the one who has been operated on under general anesthesia However, we have found that

by performing gastric lavage with water at 105 F immediately after the operation in cases in which general anesthesia was used, these patients are almost in the same condition afterward as those that have had local anesthesia As a rule, we perform all goiter operations under local anesthesia at the present time provided there is no reason why we should not do it, that is, if the patient is not excessively afraid of the local anesthesia With regard to substernal or subclavicular goiters I wish to refer to a procedure which you may find convenient to employ at some time In a few of these cases, before I made use of this precaution, the patient gave a sharp cough after the tumor had been delivered and burst the pleura which caused me much worry Now I immediately place a moist sponge in the space produced when the goiter is lifted out of its substernal or subclavicular location and then go on with the operation The explanation which Dr Lahey has given about the goiter being forced down by the strong anterior muscles is an excellent one In cases in which the goiter was poststernal and post clavicular we have found that usually the anterior muscles are especially heavy, and it has been so in many of these cases in which in the earlier times we considered the goiter too small to give rise to the symptoms which existed I believe every close observer has confirmed what Dr Mason said about the late conditions of the heart due to hyperthyroidism Landstrom brought out this fact fifteen years ago, that degeneration, once it has occurred in the heart, will not disappear, and the advice Dr Mason has given is absolutely correct In order to avoid that degeneration we must operate early

DR. ANDRE CROTTI Columbus Ohio I have operated in more than 1,000 cases of goiter of all forms In the last 500 cases, the death rate was about 2 per cent The anesthetic used was ether-oxygen In dealing with intrathoracic goiters, one must have a complete knowledge of the anatomy of the region, one must be sure to locate the right plane of cleavage otherwise only disasters will be encountered No attempt ought to be made at delivery of an intrathoracic goiter before the upper pole has been entirely ligated cut off and the whole lobe isolated as far down into the thorax as possible This procedure is very important because in many instances the connection of the intrathoracic with the cervical lobe is a very thin one It may be the only hold that one may have to pull on the goiter When the time of delivery is reached, go very gently around the goiter and separate it from the mediastinal organs especially the blood vessels, and only then shall we attempt the delivery of the goiter itself Now, either the goiter is small enough to go through the superior opening of the thorax and then the delivery will be very easy or it is too large and at that critical time of the operation an unpleasant complication occurs namely choking So far as anesthesia is concerned in those cases one must be guided entirely by the condition of the goiter and of the patient If the goiter is accompanied with bronchitis catarrh dyspnea, or marked compression on the trachea, then local anesthesia ought to be used It is in these cases that choking spells are apt to occur in the early part of general anesthesia and one must be prepared to meet the situation In the majority of cases, however, ether or nitrous oxid will do well

DR MALCOLM L HARRIS Chicago Operations on the thyroid under nerve blocking is one of the most satisfactory procedures in the field of local anesthesia The region should be blocked by bilateral blocking of the cervical plexus which may be done very easily by a single needle puncture on either side of the neck Under this method of blocking the entire anterolateral region of the neck is completely anesthetized and any operation in this region may be done without pain Concerning the psychic effect of operations on goiter even the toxic variety, this is largely in the mind of the operator and not in that of the patient The patients under complete blocking will have no psychic effect and if properly handled by the surgeon the patient will leave the table in infinitely better condition than under any general anesthetic with which I am acquainted Recovery is easier and shorter and in place of local anesthesia being a step backward it is one of the greatest steps forward introduced in operations on the thyroid as it is in operations on other regions of the body where it is applicable

DR GEORGE W CRILE Cleveland I have found objections to using local anesthesia alone on account of the important psychic factor there are objections to using general anesthesia alone because in serious cases of exophthalmic goiter there is so great an interference with the interral respiration that inhalation anesthetics may cause much injury by added suboxidation Therefore, in serious cases we take the operation to the patient in bed Using local anesthesia with analgesia under nitrous oxid does not interfere with the internal respiration of the cells This plan has succeeded remarkably well Also in certain cases we allow the wound to remain open in order to prevent the absorption of toxins from the wound and to promote postoperative comfort A comfortable patient is more likely to make a good recovery The important note I gathered from these papers was that the operators have found that it is important to conserve to the utmost degree all the resources of the patient and to add other factors of safety by good judgment, by a graduated operation by doing the right thing at the right time by local anesthesia by general anesthesia Thus they have been able to achieve great progress in the surgical treatment of exophthalmic goiter

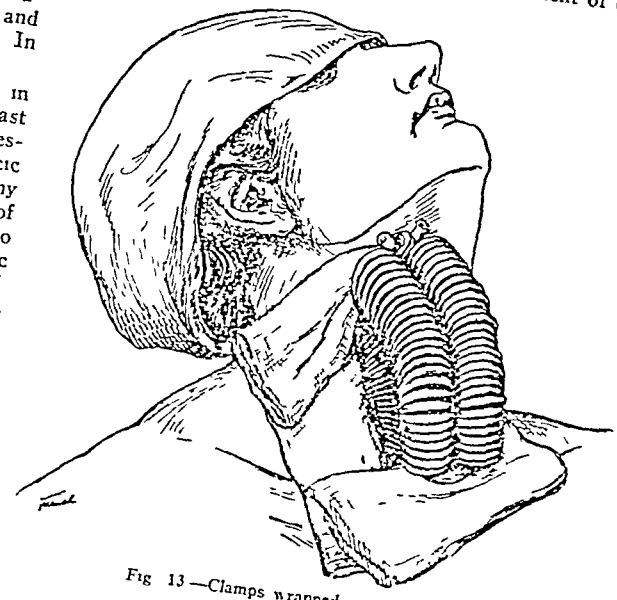

FIG 13.—Clamps wrapped with dressings.

DR. J TATE MASON Seattle We do not repeat cauterization if the patient is a safe risk for ligation The cauterization is not done twice in the same place We follow a line which eventually is removed by the thyroidectomy incision The scars will be lost in the one continuous scar that is made when the thyroid is removed I felt somewhat uneasy in reporting such a large percentage of cases of reoperation They were our earlier cases of six or seven years ago

DR FRANK H LAHEY Boston An important diagnostic point of intrathoracic thyroid is deviation of the trachea to one side One other point regarding the handling of these intrathoracic masses is the danger of injury to the recurrent laryngeal nerve There must necessarily be some cases in which injury will occur since manipulations are naturally digital and the course of the nerve is often markedly distorted It is therefore wise to explain this possibility to the friends or family before operation is undertaken

DR JOSEPH R EASTMAN Indianapolis Dr Crotti and Dr Crile struck a very important note Local anesthesia is of great value and is especially applicable in the bad cases These are the cases which concern us most If a man uses local anesthesia habitually and has become accomplished in its use then he will be the better prepared to deal with the serious cases in which its use is demanded I am pleased to have the endorsement of local anesthesia by Dr Harris

Clinical Notes, Suggestions, and New Instruments

DEATH FOLLOWING INTRAVENOUS INJECTION OF ONE CUBIC CENTIMETER OF RHEUMATISM PHYLACOGEN

MERVIN T SUDLER M D ROSEDALE KAN

A trained nurse, aged 57, acting as hospital superintendent, had suffered from rheumatism, particularly of the knee joints, for the last five years Her nose had been examined and operated on and her teeth had been extracted over a year before, with a resultant small amount of relief, but she still experienced a great deal of pain and difficulty with her knee joints In December, desperate from her suffering and lack of improvement, she secretly accepted the advice of a salesman (who is a graduate physician) who visited the hospital from time to time and who recommended phylacogen, in addition to the measures recommended by her regular physician on the hospital staff

The phylacogen was administered by a graduate nurse, according to the directions of this salesman About January 20 1 minim, diluted with physiologic sodium chlorid solution, was given subcutaneously About January 24, 3 minims, diluted with physiologic sodium chlorid solution were given subcutaneously About February 2 8 minims were given subcutaneously No general reaction followed any of these doses The first dose given intravenously was on February 7, when 0 125 c c, diluted with physiologic sodium chlorid solution was given It was then given intravenously every day for about two weeks the directions being to use in slightly increased doses, provided no reaction followed If there was any reaction the same amount was repeated the following day, and no reaction would occur There was an occasional rather severe reaction but usually only a mild one At the end of about two weeks 3 c c were given Then because of frequent reactions the dose was ordered decreased until no reaction followed, and given only one every other day This was done to February 29 The patient had not felt well all day, and at 7 o'clock her temperature was 100 4 At this time, she took 10 grains of acetylsalicylic acid At 10 o'clock, 1 c c of phylacogen was given Following this dose of phylacogen, the nurse caring for her stated that she had a chill lasting for twenty-five minutes She then complained of shortness of breath ,and began breathing hard Her breathing then became irregular and shallow The heart was very weak and irregular She was apparently nauseated just before she died, one and a half hours after receiving the medication

The nurse, in giving this medicine, carried out the instructions of the physician, who was the representative of the firm manufacturing the phylacogen

The patient had no valvular heart lesion and had never had any symptoms referable to her heart previously

A METHOD FOR DEMONSTRATING SPIROCHAETA PALLIDA IN REGIONAL LYMPH GLANDS

EDWIN W SCHULTZ M D STANFORD UNIVERSITY CALIF

The importance of establishing an early diagnosis in syphilis is clearly recognized by every one The most useful means that we have for arriving at the earliest possible diagnosis is undoubtedly by the dark field method However, occasionally difficulties are experienced in obtaining proper specimens for such examinations For example, not infrequently one receives patients for dark field examination who before consulting their physician have applied some drug to the lesion in question In the army it was not uncommon for men to apply calomel ointment on newly appearing genital sores before their nature could be established by medical examination Naturally such treatment makes the demonstration of *Spirochaeta pallida* at least on the surface of the lesion quite out of the question Fortunately, the presence of the spirochete in the deeper tissues can frequently be still discovered in these cases by puncturing the base of the lesion in the same manner as I shall describe for demonstrating their presence in lymph glands Should this fail to reveal the organism, and the regional lymph glands show even a slight enlargement, their presence may then generally be discovered by puncturing the involved glands This much is not especially new, but I should like to point out a modification of the method ordinarily employed which has proved to be far more efficient in my hands Merely puncturing a gland with a hypodermic needle and making suction with the syringe, without first injecting into the gland a small quantity of fluid, as is generally done, gives comparatively poor results The method here described will reveal the presence of *Spirochaeta pallida* in the lymph glands in practically every case of untreated syphilis

METHOD

A 2 or 5 c c hypodermic syringe with a sharp needle is employed Into the syringe is drawn from 0 5 to 1 c c of sterile physiologic sodium chlorid solution The gland is firmly fixed between the two forefingers and thumb of the left hand and with the syringe in the right hand the needle is passed through the overlying skin and then gently through the capsule of the gland The point of the needle is then rotated in order to break down some of the gland tissue After this has been done the saline solution is slowly injected into the gland, and the capsule sewell under the fingers is noted, after which the point is rotated a few times more Suction is then made with the plunger of the syringe and as much gland-pulp mixture is withdrawn as is possible, but a few drops are generally quite sufficient Several slides are prepared for dark field examination, special care being taken to select thin slides and cover-slips and prepare the specimens in films of practically capillary thickness The sort of dark field technic is all important In general, the entire procedure of procuring the specimen should be aseptic and carefully done

The modification has proved especially valuable in establishing an early diagnosis in certain cases, and has been employed without any noticeable ill effects on the patients

INDUCTION OF LABOR BY AN UNUSUAL METHOD

GEORGE L BRODHEAD M D NEW YORK

Mrs A, aged 24 at term in her first pregnancy, was sent to the Harlem Hospital, March 2, 1920 by her family physician, who suspected that she was suffering from toxemia of pregnancy Her chief complaint on admission was edema of the vulva and extremities She had no headache, dizziness, nausea or vomiting, her vision was not disturbed and she had no epigastric pain The urine showed only the faintest trace of albumin The vulvar edema had been gradually increasing for the three weeks prior to her admission

The patient was pallid sat up in bed and was slightly dyspneic, with a systolic blood pressure of 130, and diastolic, 80 The abdomen showed a full term pregnancy with the vertex well engaged in the left occipito-anterior position The fetal heart was 142 and of good quality The vulva showed a very extensive edema, the labia were tremendously swollen, and pitted on pressure, and were so large that the patient could scarcely bring her thighs together The heart showed hypertrophy and dilatation, due to the decompensated double mitral disease The pulse was irregular at times both in rate and in rhythm The lungs showed many rales of all kinds over both chests, anteriorly and posteriorly The patient's general condition was only fair, and as she appeared to be seriously ill, we believed that pregnancy should be terminated Remembering a former experience in a similar case, acupuncture of the vulva was performed March 4, 1920, at 4 p m, with the escape of a considerable amount of edema fluid The patient was immediately improved, slept much better, and felt a great deal more comfortable

At 1 a m March 5, she complained of rather severe pains in the back and lower abdomen, and on that day she delivered herself normally of a female child weighing 7 pounds 14 ounces

After her delivery the patient was more comfortable, and the edema of both the vulva and the extremities, which had markedly decreased immediately after the puncture, rapidly disappeared The puerperium was uneventful She left the hospital, March 13, in good physical condition, except for her cardiac disease

The interesting feature in the case was the onset of labor following the puncture of the edematous vulva, obviating the necessity for any intra-uterine manipulation to bring on labor

50 West Forty-Eighth Street

ATROPIN POISONING REPORT OF A CASE

WARREN E FORSYTHE M D ANN ARBOR MICH

A student, aged 22, during an attack of acute rhinitis, asked at a drug store for atropin tablets He was given ¼ grain atropin sulphate dispensing tablets without assurance as to their intended use He stated that he took one at 4 p m and that at 4 30 he noticed marked dryness of the nose and throat This was followed in a short time by muscular weakness and dizziness He took strong coffee and tea at 5 p m

When first visited at 6 p m, the patient was lying down and complained of general weakness and dry throat He was rational, but was very anxious concerning his condition The pulse was 120 and respiration 30 The pupils were dilated A mustard emetic was given, and the patient left at 7 30 p m showing no change except slight carphology

At 8 30 p m the patient insisted on getting out of bed, and made frequent trips to urinate He was given 10 grains of chloral at intervals, but continued to be restless and talk irrationally at times until 9 a m

At 9 30 a m, he was rational comfortable, passing urine normally, and able to read medium print at 16 inches The pupils were dilated and the mouth was dry At 3 30 p m the pupils were dilated, and the mouth was moist He was able to read fine print at 16 inches, and complained only of weakness

At the end of forty-eight hours after he had taken the atropin the pupils were dilated and the patient had some general weakness, otherwise he was in good condition and resumed activity without further trouble

FETAL ABDOMINAL SARCOMA OBSTRUCTING LABOR*

THOMAS D MAHER M D AND A S MUSANTE PH G M D
SAN FRANCISCO

Mrs P, aged 35, Italian, quintipara, had a previously good obstetric history, and as far as could be ascertained the patient passed through the present period of gestation without untoward incident At 5 p m, June 25, 1919, approximately at term, labor started, and at 9 p m the membranes ruptured The pains were normal in nature and the labor progressed satisfactorily until 11 p m, when the head and shoulders were delivered, but further delivery by judicious traction was unavailing Vaginal and intra-uterine examination under anesthesia revealed the fetal abdomen greatly enlarged and causing the dystocia After further attempts at manual extraction had failed the obstetric problem of the reduction in the size of the offending passenger was met by puncturing the fetal abdomen at the ensiform cartilage and extracting an immense tumor, by tearing away pieces with the fingers and hand, until the mass was reduced sufficiently to permit of the passage of the fetus

The tumor was a heterogeneous mass about twice the size of the fetal head grayish with a pinkish framework running through it, and of semisolid consistency

The reports of two pathologists showed the character of the growth to be that of myxosarcoma and its origin was thought to have been the kidney

Thorough examination of the fetal structures was not possible

*Read at the April 1920 meeting of the St Joseph Hospital Staff

THE USE OF SMALL ENEMAS IN CONSTIPATION

LOUIS HENRY LEVY M S M D NEW HAVEN CONN

I should like to call attention to a means which I have been using in combating constipation in cases that have resisted the usual forms of medication by mouth, such as the salines, pills and tablets liquid petrolatum and agar It is the use of soft soap containing either glycerin, turpentine cottonseed oil or mixtures of these one or two teaspoonfuls added to 4 ounces of warm water This is injected directly into the rectum by means of a rubber bulb syringe of 4 ounces capacity This makes a nice method for rapid use and rapid results Occasionally I follow up this enema with another one of a similar amount, of warm water The formula is

		Gm or Cc	Per Teaspoon Cc
℞	Rectified oil of turpentine	5	2
	Cottonseed oil	25	1
	Glycerin	45	2
	Soft soap	45	2
	Oil of peppermint	q s	

I have been able to get some excellent results especially in those cases of rectal constipation mentioned by Alvarez With smaller amounts of the soft soap mixture this method can be used safely in children The treatment of constipation by enemas is an ideal short cut method and should be more universally used

1172 Chapel Street

ELEVATION OF CONJUNCTIVA NEAR LIMBUS PREVIOUS TO CATARACT EXTRACTION

ARTHUR WHITMIRE M D NEW ORLEANS

According to a method that I have used for some time to facilitate making a conjunctival bridge less hazardous I inject about 5 mm of sterile water from a hypodermic syringe under the conjunctiva at the upper limbus, to elevate it as far back as is necessary This I do immediately before making corneal section Many conjunctiva bridges are divided in the making on account of the patient's squeezing, or because the conjunctiva lies too close to the sclera I have employed this additional precaution in not more than twenty-five cases, but find it quite advantageous

New and Nonofficial Remedies

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION W A PUCKNER SECRETARY

DIPHTHERIA TOXIN-ANTITOXIN MIXTURE (See New and Nonofficial Remedies 1920 p 264)

Gilliland Laboratories Ambler Pa

Diphtheria Toxin Antitoxin Mixture (Gilliland)—Each Cc of the mixture represents three lethal (Lt) doses of toxin and approximately 3 2 units of antitoxin Marketed in packages of three 1 Cc ampules representing one immunizing treatment in packages of three 1 Cc syringes representing one immunizing treatment also in packages of thirty 1 Cc ampules representing ten immunizing treatment

GONOCOCCUS VACCINE (See New and Nonofficial Remedies 1920 p 283)

Lederle Antitoxin Laboratories New York

Gonococcus Glycerol Vaccine (Lederle)—A suspension of killed gonococci in a vehicle composed of glycerol 66 per cent physiological solution of sodium chloride 30 per cent and trikresol 1 1 per cent The product is supplied in packages of 15 vials containing proper amounts of gonococcus glycerol vaccine and 15 vials of sterile diluent with which to make the proper dilution of the vaccine Each 1 Cc contains of 0 1 Cc of gonococcus glycerol vaccine (the remainder consisting for each 1 Cc) and 0 9 Cc of sterile physiological solution of sodium chloride After dilution the doses (1 to 15 300 400 500 600 700 800 900 1000 11 million killed gonococci respectively

PROHIBITION AND THE MEDICAL PROFESSION

If one were to take seriously the newspaper jokes and gibes regarding the prescribing of whisky by physicians one might assume that the medical profession had lost all honor Any self-respecting physician must blush for shame at what he regards as slanders on his profession Unfortunately, however, the charges are apparently true, so far as they apply to some physicians The office of the Federal prohibition enforcement officer for Illinois contains sufficient evidence to establish the truth of the reports, so far as they concern a not inconsiderable number of physicians

As is well known, the regulations governing the prescribing of intoxicating liquors require that prescriptions shall be written on regular blanks provided by the government, which are issued in book form Each of the books contains 100 blanks, with corresponding stubs On these stubs must be written the date, the name of the patient, the amount of whisky prescribed and the disease for which it is given These stubs are a record of what the physician has prescribed during a certain period Before obtaining a new book, the physician must return the stubs of the old one Examination of these stubs reveals that some physicians have been writing from seventy-five to 100 prescriptions for whisky a month The stubs of a dozen different books examined at random show that in no single instance was the prescription for less than the maximum quantity allowed by law—one pint, or sixteen ounces An analysis of ten books—one thousand blanks—shows that the diseases given as the reason for prescribing whisky were bronchitis, 354, general debility, 167, la grippe, 163 Boils, coryza, diabetes, nephritis, endocarditis, eyestrain and headache, hay-fever, nasal catarrh, rheumatism and urinary irritation were some of the other disease conditions for which whisky was given

Undoubtedly, the conditions in Chicago are duplicated to a greater or less extent in other cities Naturally, the proportional number of physicians who are selling their rights and privileges as members of an honorable profession for "a mess of pottage" is very small, but that even a small number of physicians could be so lacking in honor reflects on the profession as a whole Our profession has always been regarded by the public as an honorable one Its members are presumed, by the very nature of their calling, to be upright and dependable Physicians are, in a sense, a privileged class, as is emphasized in the laws of all civilized nations With the privileges go certain responsibilities and obligations which every physician, tacitly at least, assumes when he enters the profession It is such a privilege that was conferred on him by the government, under the laws enforcing the principles of the Eighteenth Amendment to the Constitution of the United States These privileges were granted on the assumption that there might be times when physicians would need to prescribe intoxicating liquor for sick persons It is beside the question as to how many prescriptions for liquor any physician may need to write in a certain length of time It is obvious—there is no denying the fact—that some physicians are grossly abusing their trust in this matter The privileges were granted to physicians with the presumption that they would use them honorably, and would prescribe intoxicating liquor only when absolutely necessary—if such necessity ever exists [1]

The whole question is a serious one which should, be faced frankly by the organized profession It is one which merits the immediate attention of county medical societies throughout the country Already physicians in many communities have taken action defining their attitude toward those physicians who have traded an honorable name for the unworthy title of "bootlegger" For the good name of our profession, it should be made known to the public in an emphatic manner that such disreputable practices, on the part of any physician, are not condoned Noblesse oblige

TISSUES FUNCTIONALLY EQUIVALENT TO THE SUPRARENALS

Two facts with respect to the physiology of the suprarenal glands have become generally accepted, namely, that these structures are indispensable to life, and that extracts of them, or the epinephrin obtainable from them, can exert very pronounced physiologic effects on the body Whether the latter potency is a common mode of altering the bodily functions during life, that is, whether the suprarenals exhibit an important internal secretory activity under the normal conditions of existence, has been somewhat debated The enthusiasm for the earlier belief that vasomotor tone and other essential phenomena are continually

1 In the words of the law No physician shall prescribe liquor unless after careful physical examination of the person for whose use such prescription is sought or if such examination is found impracticable then upon the best information obtainable he in good faith believes that the use of such liquor as a medicine by such person is necessary and will afford relief to him from some known ailment,'

regulated by an internal secretion of the suprarenals has waned The once asserted relationship between nephritis or arteriosclerosis and suprarenalemia is no longer emphasized by experimental investigators, and the various assumed interreactions between the suprarenals and other systems of gland structures in the body cannot yet be outlined in a convincing way

The foremost evidence for the indispensability of the glands consists in the results of extirpation experiments, which are quickly fatal in most species The fact that the majority of patients who succumb to Addison's disease show a bilateral destruction or atrophy of the suprarenal glands favors the view that this malady is due to some sort of insufficiency of these structures Epinephrin, which has long been regarded as the "active principle" of the suprarenals, is produced in the medulla of the glands Since administration of epinephrin as a rule fails to stay the course of Addison's disease, the question has arisen whether the cortical portions of the suprarenals do not also play an important physiologic part Furthermore, chromaffin structures analogous in character to the suprarenal medulla are scattered in small masses through other parts of the body If they are functionally equivalent to the suprarenals, it can be understood why persons may survive apparently severe pathologic changes in the glands

This suggestion that chromaffin tissues located elsewhere than in the suprarenals may act in a way compensatory to the latter is suggested by the report of an unusual case observed by Strauss [1] in Berlin The history of the patient showed the classic picture of Addison's disease, which had not covered a period of more than six months The necropsy, however, disclosed an entire lack of suprarenal glands No vestiges of them could be discovered As the absence of any detectable residual structures made it seem unlikely that the suprarenals had been present in the months immediately preceding death, Strauss has concluded that the remaining parts of the chromaffin tissue in the body must have functioned in some way for a long time to maintain the physiologic activities for which the suprarenals ordinarily are primarily reponsible Perhaps the situation can best be summarized, from the results of this unusual case, by noting that the suprarenals per se are only a part, though probably the overwhelmingly most significant portion, of a larger system of essential tissues Since these nonsuprarenal structures may be functionally equivalent in some measure to the suprarenals, as Strauss' findings seem to suggest, it becomes important to learn more about the distribution and performance of the tissues responsible for prolongation of life when the suprarenals themselves are severely involved

SOCIAL WORK FOR THE HARD OF HEARING

Specialism develops a tendency toward the elimination of the intimate personal relationship between physician and patient which existed when the family practitioner was the only type However, there has been developing among physicians a social mind, and the specialist of today is beginning to realize that it is his duty to "see the patient through," and lend his aid to restore him, not only physically, but mentally, economically and socially, as nearly as possible, to the best position he is capable of occupying in relation to other human beings In other words, the physician's duty does not end when he has done all he can to correct the physical disability Manifestations of the newer spirit are evidenced in great surveys now being made as to the number of physically handicapped persons in various communities, in the organization of service leagues for the handicapped, and in the creation of institutes for vocational education and of bureaus for propaganda to interest the public in this altruistic work

A particularly difficult problem is that of the care of the deaf, including those who suffer from speech defects As is beginning to be recognized, this class of disabled persons is peculiarly hypersensitive Through repeated failures to secure relief and through impositions practiced on them by the unprincipled, they have become suspicious of all efforts toward their improvement In a recent symposium before the Section on Otology of the New York Academy of Medicine, Dr Wendell C Phillips called attention to the fact that the physician is frequently unable to supply more than palliative measures in these cases The deafness is progressive, and with the increasing deafness, there appears an increasing depression of the patient's spirit, inclining him to believe that his life will be useless and, in some instances, leading even to suicide It is in such cases that the application of otologic skill is the minor phase of treatment "The otologist," according to Dr Phillips, "should not be only the otologist, but the wise counselor, treating his patient as a client whose comfort and happiness he should safeguard equally with that of his physical infirmity He should be prepared to warn him against the pitfalls of despondency, of charlatanism both inside and outside of the medical profession, and to conserve his finances by warning him against responding to advertised quackery in every form He should encourage him to accept his fate as his peculiar 'thorn in the flesh,' and to have no fear in letting his friends become aware of his infirmity In other words, deafened people should be warned against their arch-enemies, hypersensitiveness and despondency"

The simple warning in itself, however, is not sufficient Despondency must perforce increase, unless the patient is pointed to a way out— he is shown

how he may remain or become a useful citizen Much of the sensitivity of the deafened person is dependent on the fact that he must utilize unusual devices for hearing or for communicating his thought He should be made to understand that through the discovery and encouragement of the art of lip reading, these extraneous and conspicuous methods have been largely done away with The physician should be able to direct the patient to some of the many leagues or organizations now existing or being formed in most of our principal cities under the leadership of the central Association for the Hard of Hearing, which teach this art to the deafened worker, and where special classes are held to enable the deaf to study lip reading together, thus giving them confidence in their ability [1] Through practice they lose their hypersensitivity and nervousness, and become almost as proficient in hearing through the eye as is the ordinary person using the normal organ for this purpose Furthermore, through special employment bureaus, situations are secured for deafened workers, especially adapted to their infirmities It may be pointed out that the deaf employee does not waste time in conversation, and that, through his infirmity he is attached to his situation, so that he is not continually changing from one occupation to another

There are few fields of philanthropy which will pay so highly in the reward of successful accomplishment as will aid to those physically handicapped when given in the manner described The mere bestowal of charity serves to increase sensitiveness and to stimulate pauperization Instruction and aid which cause the handicapped to become producing members of society develop ambition and happiness, decrease sensitivity, and thus are a real charity

1 Complete information may be obtained by writing to the New York League for the Hard of Hearing 126 East Fifty Ninth Street, New York City

FURTHER NEW ZOOPARASITES OF MAN

Only a few years ago the search for new varieties of bacteria in their possible relation to disease was one of the foremost activities of the pathologic investigator Discoveries in the domain of bacteriology had demonstrated the profound importance that they might assume in the problems of medicine With the growth of knowledge regarding the role of bacteria in the genesis of specific diseases, the finding of new microorganisms has become less frequent in occurrence Indeed, the proof of the etiologic association of some heretofore unrecognized species of bacteria with an old malady has come to be a comparative rarity in medical investigation On the other hand, other types of parasites, notably those of animal origin, are beginning to awaken more and more interest, so that animal parasitology is claiming a larger share than ever before in the field of pathologic research

From a popular standpoint, the story of the hookworm has probably been most widely heralded But uncinariasis is only one of many harmful manifestations of the zooparasites of man Fecal examinations conducted in all parts of the world of late, particularly by the medical officers active in the World War, have disclosed an unexpected incidence of parasitic invaders, some of which have more than intestinal or purely local effects on their host One of the latest finds is reported from the Chosen-Government General Hospital at Seoul [1] It refers to a species of *Rhabditis*, temporarily designated as *Rhabditis hominis* n sp, a viviparous parasite found numerously in the freshly passed feces of schoolchildren Heretofore most species of *Rhabditis* and its allies have been found free living in the earth and decayed vegetable matter, although a parasitic specimen in man has been reported Best authenticated is the rhabditiform larva which was found in 1882 by Nielly in cutaneous papules, chiefly on the limbs, along with small worms in the blood

In the Korean investigation, seventeen out of 668 schoolchildren examined in one district were found infected with the parasitic worms of the new species In another place, three cases were discovered among 471 pupils In a number of these young people the worms had passed out of the body in the course of two or three months without any medical treatment This suggests that, perhaps, *Rhabditis hominis* may not be a true parasite, but may have happened to find temporary or accidental lodgment in the human body The Japanese discoverer [1] regards it as highly probable, however, that the worms can thrive in the human alimentary canal, because they were found abundantly and in all stages of their development The nematode reminds one, in some ways, of possible infections with *Strongyloides stercoralis*, which has rhabditiform embryos and has been found not only in the Far East, but even in the United States Strongyloidosis has been alleged to occasion a variety of intestinal disturbances The new worm found in Korea cannot be mistaken for *Strongyloides stercoralis*, because in contrast with what occurs with the latter, eggs of the rhabditoid worm are not found in the feces It is not unlikely, according to Kobayashi, that the two species have been confused in the past in descriptions of nematode infections of the alimentary tract

Another recent acquisition to the list of animal parasites of man is a small biflagellated protozoon found in smears and cultures from patients dead of influenza in an army camp The organisms were spherical or pear-shaped, possessing two free flagella and a kinetonucleus They are regarded by their discoverers [2] at the base hospital of Camp Zachary Taylor, Ky, as accidental invaders of the body, rather than pathogenic in character

Current Comment

THIS YEAR'S FOURTH OF JULY CELEBRATION

It will be recalled that from 1903 to 1916, inclusive, THE JOURNAL conducted a campaign for a safe and sane celebration of the Fourth of July Facts and figures were gathered and published each year showing the various casualties that resulted from the method of celebration then prevalent Ultimately the annual holocaust of deaths and injuries, together with the noise and hubbub due to the use of death-dealing fireworks, gave way to a safe and sane celebration By 1916, the annual number of deaths from tetanus had been reduced from 406 to none and other fatalities reduced to a minimum THE JOURNAL felt that its object had been accomplished and the publishing of statistics was discontinued Newspaper reports of the celebration this year indicate that there has been a serious relapse into the old conditions Many deaths and large numbers of serious wounds are reported Of the deaths, several were due to the supposedly harmless sparklers Of the injuries, the more serious, as usual, were caused by cannon crackers It is still too early, at this writing, for reports on tetanus, but it can be predicted that with a return to the use of high explosives in the celebration of the Fourth of July there will be a return of mutilation injuries and fatalities with increased possibilities for tetanus Will it be necessary to learn our lesson over again?

MULTIPLE EXOSTOSIS

Cartilaginous exostoses have been among the rarer phenomena coming to the attention of physicians The roentgenographic method of observation has greatly increased the possibilities of detecting these abnormalities of growth, so that what is at present a clinical rarity may presently be found more common than is currently suspected It has happened more than once in the history of medical diagnosis that the introduction of more accurate methods of observation and analysis or forceful publicity by striking descriptions of unusual anomalies has resulted in bringing them to light in unanticipated numbers of cases Perhaps this will prove to be the outcome of the present interest in exostoses Honeij [1] has recently correlated the findings in sixty-six reported cases of multiple cartilaginous exostosis with the result that certain theses seem to be presented with clearness if they are not, indeed, definitely established Apparently the disease involves well defined metabolic disturbances, if one may judge by the alterations in the metabolism of calcium and magnesium found by Underhill and Bogert The excretion of the alkali earths shows a tendency toward abnormally large values, particularly when the intake is inadequate Malformation and deformities occur at an age not yet determined, owing to arrest in growth of the skeleton and to bone growth arising at such points as to interfere with the normal growth and direction of the bones The exact nature of the objectionable growths cannot be properly ascertained until more examinations are made at different ages and developmental periods According to Honeij there is no evidence that infection plays a part in the etiology, but since a positive relation through heredity was obtained in thirteen of thirty-three cases, the disease having occurred in some member or members of the patients' families, he believes that hereditary factors are concerned The numerous roentgen-ray observations now made daily on hundreds of persons may be expected to increase knowledge of the exostoses in rapid order

NEW MEDICAL SCHOOLS

In times past reports regarding the establishing of new schools of medicine have caused some anxiety among those interested in the development of medical education, since the country was already oversupplied with such institutions With rare exceptions, also, the new schools reported were opened without adequate financial backing, or without satisfactory clinical material How different, however, is the news in regard to the medical school to be established by the University of Rochester As reported recently, through the gifts from Mr George Eastman and the General Education Board, this institution will have a total endowment of $9,000,000, which guarantees ample buildings, laboratories and hospital facilities In this connection the news is also welcome that the University of Wisconsin has obtained legal authority to offer a complete four year medical course within the next few years Of the eleven universities now offering the two year medical course, the University of Wisconsin has established the work on the most elaborate scale and is in an excellent position to develop clinical departments of an equally high grade The campaign for the improvement of medical education during the last sixteen years has resulted in reducing the number of medical schools from 162 to eighty-five A vast oversupply has given way to a more nearly normal quantity We can still dispense with several medical schools of a seriously low type, but there is always room for those which are amply endowed, and prepared to teach modern medicine in a practical manner

NEW FACTS REGARDING OPIUM ALKALOIDS

In a series of investigations on the pharmacology of opium alkaloids, Macht emphasized that these compounds could be grouped into two distinct categories, in doing this he [1] defined more clearly the work of Pal, Straub, Sahli, and others One of the categories the piperidin-phenanthrene group, of which morphin is the principal member, includes substances that stimulate the contractions and increase the tonus of smooth muscle The second, or benzyl-isoquinolin, group, of which papaverin is the conspicuous member inhibits the contractions and lowers the tonus of the same active tissue It was through the discriminating pharmacologic analysis that attention became

1 Macht D I Action of Opium Alkaloid J Pharmacol & Exper Therap 7 309 1915

prominently directed to the inhibitory effect of benzyl alcohol and its derivatives, so that they have found some recognition in therapy as antispasmodics On the other hand, Straub's so-called morphin reaction, consisting in a peculiar stiffening or bending backward or curling of the tails of mice which have received doses of morphin, can now be explained as due to the spasms of the sphincters of the anus and bladder provoked by the alkaloid in question As the morphin molecule includes both piperidin and phenanthrene groups, Macht[2] has undertaken to ascertain the effect of these groups separately on smooth muscle The upshot of the research has been to demonstrate the comparative inertness of phenanthrene, whereas piperidin is found to be a powerful stimulant of this contractile tissue, suitable doses causing an increase in the rate and strength of its contractions and an increase in its tonicity Macht asserts that this interesting effect of piperidin on smooth muscle has never before been described Its possible significance deserves further consideration

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION PUBLIC HEALTH ETC)

ARKANSAS

Martin Clinic Organized—Dr E H Martin announces the formation of the Martin Clinic with offices in the Dugan-Stuart Building Hot Springs, and with the following staff Drs Edward H Martin chief of clinic, Ernest A. Purdum, medicine, William G Klugh, neurology, George C Coffey, urology, William F Porter gastrology, W C Minnich surgery, Milton T Edgerton, Jr ophthalmology, W J Fort, roentgenology, and L M Runskequitz, clinical pathology

Personal—Dr Octavius L Williamson, Marianna, has been appointed a member of the state board of health, succeeding Dr Charles M Lutterloh, Jonesboro, deceased——Dr William E McLean has been appointed health officer of Little Rock, succeeding Dr Robert C Foster, who resigned to accept a position as passed assistant surgeon U S Public Health Service, with station at Houston Texas——Dr H H Niehuss, Eldorado for many years health officer of Union County, has also been appointed health officer of Eldorado

Physicians Protest Against Tax—Members of the Garland County Medical Society at its meeting in Hot Springs, July 1 entered a protest against the tax recently levied by the Division of National Parks of the Department of the Interior compelling all physicians who prescribe the hot radio-active baths to pay the government $60 a year The Department of the Interior also has ruled that physicians desiring to take the examination to prescribe the hot baths must pay a fee of $10, and if they pass the test must pay an additional fee of $15

FLORIDA

Bubonic Plague—After several days of freedom from the disease the fourth case of bubonic plague was officially reported in Pensacola, July 7, the patient being a driver for an express company The state health officer has urged the people to assist in the campaign to exterminate rats

ILLINOIS

Personal—Dr Edgar G Merwin Highland, sustained a fracture of the leg in a collision between automobiles June 10, and is under treatment at St Joseph's Hospital Edwardsville——Dr Harry S Holmes of the Lincoln State School and Colony, was stabbed in the back by a young man whom he had reproved for using foul language——Dr Clifford P McCullough, Lake Forest, sustained a severe cut in the face by being accidentally struck with a golf ball

Clinics to Be Established—The Moline city council on July 8 passed an ordinance providing for the establishment of a city venereal disease clinic and for making venereal disease reportable The clinic will be under the supervision of Dr David E Kohler——An all-day clinic was conducted at the Robinson Hospital, June 30, by the medical field director of the Illinois Tuberculosis Association——On June 29, a tuberculosis clinic was conducted at Kewanee by Drs Orville W McMichael Chicago, Russell L Adkins, Springfield, and James W Pettit, Ottawa, under the auspices of the Henry County Tuberculosis Association

Chicago

Explosion in Hospital—Fire which started in the basement of the South Chicago Hospital, July 10, occasioned much excitement and necessitated the removal of thirty-five patients from the building The fire started in the basement and is believed to have been due to the explosion of chemicals None of the patients were injured, but the janitor was seriously burned and may die

Home Nursing School—The sixth session of the training school for home and public nursing opened July 7 The classes are held three times a week and the course lasts eight weeks At the graduating exercises of the fifth course held at the Municipal Tuberculosis Sanatorium, June 29 a proposal to raise a million dollars to make the training school a permanent institution was presented to the board of directors of the institution A class of 478 was graduated

Personal—At a meeting of the Council of the Society of Medical History of Chicago, Dr Morris Fishbein was elected secretary-treasurer to succeed the late Dr Stanton A Friedberg——Dr and Mrs Kellogg Speed sailed for France July 3 Dr Speed is one of the delegates from the United States to the International Surgical Congress which meets in Paris July 19——Dr George G Zoehrlaut has been appointed a special deputy collector of internal revenue, and will have charge of collecting taxes on motor boats in the Chicago district

INDIANA

New Clinics—The City Board of Health of Indianapolis has ordered the establishment of three additional tuberculosis day clinics and one night clinic One of the clinics is for colored people The clinics will be supported by money derived from the special tuberculosis tax levy

Personal—Dr Ira Miltimore has returned to his duties as chief surgeon of the Gary Steel Company Hospital after a three months' trip to Panama and South America——Dr John W Cook Pendleton was stricken with cerebral hemorrhage, June 21 It is believed that he will recover——Dr Thomas O Redden Indianapolis, fell into a cistern at the rear of his house July 3, and was rescued with great difficulty——Dr Gardner C Johnson, Evansville, president of the state antituberculosis association, will act as temporary superintendent of the Boehne Camp after the departure of Dr Thomas Willett, Evansville

IOWA

Public Health Nursing in the University of Iowa.—Beginning with the academic year in September, the University of Iowa will conduct a course in public health nursing, open only to graduate nurses

Alumni Election.—At the annual meeting of the Alumni of Keokuk Medical College, Dr Benjamin S Pennington Hoisington, Kan was elected president, Dr Albert C Armitage, Shenandoah, vice president, Dr Henry C Young Bloomfield, secretary, and Dr Alanson M Pond, Dubuque, treasurer

Personal—Dr Robert E Jameson, Davenport, was operated on at Mercy Hospital, July 1, for gastric ulcer——Dr Grant J Ross, Sioux City has been installed as medical director of the Iowa Department of the Grand Army of the Republic——Dr Jennie McCowen, for more than thirty-five years physician of the Cook Home, Davenport, has resigned

Employee May Choose His Own Physician.—A committee has been appointed by the Dubuque County Medical Society to investigate the statement made by a local manufacturing company that it would not be responsible for bills from any except its own company physician for services rendered its

2 Macht D I A Pharmacodynamic Analysis of Straub's Morphine Reaction J Pharmacol & Exper Therap 15 243 (May) 1920

employees The committee has reported that an employee has the right to choose any physician he pleases under the Iowa workingmen's compensation law

KANSAS

Detention Home Opened —The state detention home at Lawrence was opened June 1 In this institution, girls infected with venereal disease will be treated

State Board Election.—At the annual meeting of the state board of health held in Topeka June 25 Dr Oliver D Walker, Salina, was elected president, Dr William M Earnest Washington, vice president, Dr Samuel J Crumbine, Topeka, secretary and executive officer (reelected for the seventeenth year), Albert J Jewell, chief engineer, and C F Maxcy, state bacteriologist succeeding Dr Sara E Greenfield, resigned

Public Health Association Organized —At the annual meeting of the state board of health of Topeka June 25, the Kansas Public Health Association was organized Rev Edmund J Kulp, Topeka, was elected president, Mr William Allen White, Emporia, and Dr Samuel J Crumbine, Topeka, vice presidents, Dr Charles H Lerrigo, Topeka, state registrar of vital statistics, secretary, and Dr Earle G Brown, health officer of Topeka, treasurer

MARYLAND

Personal—Dr Laurence Hickman, president of the Baltimore City Jail Board underwent an operation for appendicitis recently at the Hebrew Hospital, and is reported to be improving rapidly

Campaign Against Bubonic Plague —Because of the presence of bubonic plague in cities connected with Baltimore through steamship lines, Dr C Hampson Jones health commissioner, has taken steps to prevent the introduction of the plague into Baltimore He will conduct a vigorous campaign against rats and other rodents that carry the disease. The U S Public Health Service has asked all health officials along the Atlantic Coast to prepare to fight the disease

MICHIGAN

Personal—Dr William G Hutchinson, Detroit, was elected third vice president of the Michigan Mutual Life Insurance Company, June 19

Sanatorium Enjoined —An injunction is said to have been granted in the circuit court by Judge Burton of Big Rapids, June 26 against Dr Benjamin A Shepard, Kalamazoo, to restrain him from operating an institution known as the Pine Ridge Tuberculosis Sanatorium

University Notes.—The national research council has reappointed Dr E T Barker to its fellowship in the University of Michigan, Ann Arbor——Dr Ira Dean Loree, associate professor of genito-urinary surgery in the medical school, has resigned——Dr Clyde B Stouffer, assistant physician of the university health service, has resigned——The medical library of the late Dr Enos Church has been given to the university by Mrs Church

Work Against Tuberculosis—Tuberculosis sanatoriums in Michigan now number twenty-seven with a capacity of less than 1,000, while the number of known cases of tuberculosis in the state is approximately 25 000——The clinic division of the Michigan Anti-Tuberculosis Association held four separate series of free clinics in Macomb, St Joseph and Washtenaw counties and on Drummond Island The series commenced, June 14 in Macomb County, June 22 in St Joseph County, July 6 in Washtenaw County, and July 12, on Drummond Island

MINNESOTA

Hospital Staff Organized—The staff of the Fairview Hospital, Minneapolis organized April 28 and elected Dr Henry L Williams president, Dr Oscar Owre vice president, and Dr Frederick J Souba, secretary-treasurer

Research Fellowship Created—A tuberculosis research fellowship in the University of Minnesota to be supported by the Hennepin County Medical Association has been created The object of the fellowship is to encourage research in means for the cure and prevention of tuberculosis and will be for the first year $750, and for the second and third years, progressively increasing amounts

Personal—Dr Elias Potter Lyon, dean of the University of Minnesota Medical School was granted the degree of Doctor of Laws by the St Louis University at its commencement, June 7——Dr Lawrence F Sutton St. Paul, field inspector for the Minnesota Sanatorium Commission, has gone to England to make a study of social conditions——Dr William Friesleben, St Cloud has been appointed coroner of Stearns County——Dr Pierre A Hilbert, Melrose, has been appointed a member of the state board of control

MISSOURI

Hospital Building Started—Construction work on the new Callaway County Hospital at Fulton has been begun and the cornerstone has been laid

Fined for Violation of Narcotic Law—Drs Commodore E Bennett Joplin and John W Jeans, Prosperity, are said to have pleaded guilty to a charge of violation of the Harrison Narcotic Law and to have been sentenced to imprisonment for ninety days and four months respectively in the Newton County jail——The permit of Dr Jeans to practice medicine in the state is said to have been suspended by the state board of health for a period of ten years

New Dispensary—The Albert Benjamin Dispensary Kansas City, was opened June 18, at Admiral Boulevard and Harrison Street It is being operated under the direction of the United Jewish Charities and its objects are the furtherance of science the study of diseases and the instruction of nurses and assistants——A free health clinic has been opened at Carthage under the charge of Drs Cassius M Ketcham, Edward J Burch and Herman A LaForce

Personal.—Dr William L Gist has been appointed superintendent of the Kansas City General Hospital succeeding Dr A W Thompson resigned——Dr William A Clark has been appointed chief of staff and Dr Lawrence David Enloe, secretary of the staff of St Mary s Hospital Jefferson City——Dr Malvern B Clopton, St Louis, has been elected president of the Missouri Association for Occupational Therapy succeeding Dr G Canby Robinson resigned——Dr Porter E Williams has been reappointed superintendent of State Hospital No 2 St Joseph——Dr Hasbrouck De Lamater formerly health officer of St Joseph, has been appointed health officer of Norfolk County, Va and has been succeeded by Dr George M Boteler, St Joseph——Dr W M Lamkin Eugene is reported to be critically ill as the result of a cerebral hemorrhage——Dr James W Bruton, Ozark has been appointed state deputy health commissioner

MONTANA

State Board Building Dedicated—The new building of the state board of health, which has been erected at a cost of more than $50 000 was dedicated July 11 The dedicatory exercises were conducted by Governor Stewart

Health Regulations Circularized—Booklets giving all the necessary data as to the duties of county health officers and methods to be employed by them together with a copy of the state health laws and the new regulations were mailed to all county health officers the first week in July

Public Health Officials Meet—The annual meeting of the Montana Public Health Association was held at the state house Helena July 11 and 12, under the presidency of W N Cobley, state chemist Bozeman In addition to the general sessions there were also meetings of the sections on tuberculosis child welfare industrial hygiene and sanitary and water works engineering

NEBRASKA

Hospital Dedicated—The Lynchburg Hospital was dedicated May 4 by Archbishop Hodges——The Verges Sanatorium Norfolk has been opened by Dr Carl J Verges

Personal—Dr Jacob O Hoffman Orleans has retired after more than forty years practice——Dr John T Standard has been made mayor of Ulysses——Dr Charles A Hull Omaha has been made chief surgeon of the Omaha and Council Bluffs Railway Company——Dr D S Brazda has been appointed instructor in anatomy in the University of Nebraska during the absence of Mr Homer P Latimer professor of anatomy at the university who has been granted a leave of absence for a year that he may study at the Institute of Anatomy of the University of Minnesota

NEW JERSEY

Personal.—Dr Isaac Barber Phillipsburg has been appointed a member of the state board of taxes and assessments——Dr Clarence A Hofer Metuchen who was

operated on recently for appendicitis complicated by gallbladder disease is convalescent——Dr Samuel K Salasin has been elected health officer of Atlantic City, succeeding Dr Talbot Reed, deceased

NEW YORK

Eye Clinic for Watertown—The Visiting Nurse Association has opened an eye clinic to care for children in the schools who cannot afford the services of an oculist

Sanitary Exhibit Installed—The Jewish Agricultural and Industrial Aid Society has installed a permanent exhibit on its property at Ellenville to demonstrate to farmers and proprietors of boarding houses how wells, springs, cesspools, sewage disposal plants and privies should be constructed and maintained in rural districts

Outline Lecture on Tuberculosis—The *Monthly Bulletin* of the New York State Department of Health announces that an outline lecture on tuberculosis for use before lay audiences in connection with the department set of lantern slides on this subject is now available and may be obtained by writing to the Supervisor of Exhibits, State Department of Health, Albany

Civil Service Examinations—Examinations will be held July 31, to fill the following positions

Assistant medical examiner state industrial commission, salary $2 000 (separate circular)

Physician and assistant physicians state institutions, salary $1,500 to $1 800 and maintenance candidates will be rated on training experience and personal qualifications

Physician (psychiatrist) Syracuse State School for Mental Defectives salary $2 000 and maintenance, candidates must be trained psychiatrists and will be rated on training experience and personal qualifications

Information regarding these examinations or separate circulars may be obtained by addressing the State Civil Service Commission, Albany Application forms for these positions will not be sent out after July 19

Personal—Dr Clarence E Cobb, Bath, has been appointed superintendent of the Steuben County Tuberculosis Hospital to fill the vacancy caused by the resignation of Dr Elliot I Dorn, Bath who assumed the superintendency of the Chautauqua County Tuberculosis Hospital April 1——Dr Clarence W Buckmaster, Yonkers, has entered on his duties as health commissioner of Yonkers and has appointed Dr Chauncey V Umsted, Yonkers, as assistant commissioner of health ——Morris Scherago, formerly head of the department of bacteriology of the University of Kentucky, has been appointed assistant bacteriologist in the state laboratory——Dr Hermann M Biggs, state commissioner of health, has been given the honorary degree of Doctor of Science by Harvard University in recognition of his work in combatting tuberculosis——Dr Edward F Marsh, Brooklyn, consultant in venereal diseases of the state department of health has recently been appointed assistant professor of hygiene and preventive medicine in Long Island College Hospital, Brooklyn——Dr Edward S Godfrey, Albany, has been appointed acting director of the division of communicable disease

New York City

New Clinics Established—The Visiting Nurse Service of the Henry Street Settlement announces that it has established four new clinics in connection with its nursing and medical facilities Plans looking to the establishmet of a diagnostic clinic are under way

Acquitted of Violation of Harrison Act—Dr Christian F J Laase has been acquitted in the United States district court on all of twenty-seven counts of an indictment returned against him a year ago alleging violation of the Harrison drug law in prescribing for addicts

Medical Education Association—At the meeting of the directors of the New York Association for Medical Education held in New York, June 21, the following officers were elected Dr Haven Emerson, president, Drs George David Stewart and Glentworth R Butler, Brooklyn, vice presidents, Dr Otto V Huffman, Brooklyn, secretary, and Dr Arthur F Chace, treasurer

Ask Leniency for Physician Convicted of Manslaughter—The conviction of Dr Julius Hammer of the Bronx for manslaughter in the first degree for having performed a curettage on a woman, which resulted in her death has called forth protests from Bronx physicians A petition signed by 400 physicians and surgeons has been presented to the Bronx County court asking for clemency for Dr Hammer This action is said to be a forerunner of a movement to appeal to the legislature to amend the penal law so as to make it possible for a physician to perform an operation of this kind to protect the life or health of a patient without fear of spending twenty years in prison Physicians state that in the present case the operation performed by Dr Hammer was justifiable and object to having "a jury of laymen pass judgment on the acts of reputable doctors"

Antirat Campaign and Other Precautions Against Plague—Owing to the danger of the spread of bubonic plague through infected rats, regulations to prevent the escape of rats from vessels docking in this port were adopted some time ago and recently special efforts have been made to apply them The sanitary bureau of the department is conducting conferences with ship owners, pier lessees, civic organizations, warehouse men and professional rat exterminators relative to ways and means to destroy rats and prevent any from landing from vessels A circular has been printed for general distribution urging cooperation on the part of every citizen in the effort to destroy rats and giving definite instructions as to how they may be caught and disposed of All ships coming to port are being carefully inspected and when there is suspicion that passengers may have been exposed in Europe they are taken to Hoffman Island for observation

PENNSYLVANIA

Hospital Building Begun—Work of construction has been started for the Emergency Hospital at Ellwood City

New Medical Organization—Physicians of Beechview, West Liberty, Brookline, Dormont and Mount Lebanon met in Dormont, April 22, and organized the South Hill Medical Association with Dr Chauncey L Palmer, Mount Lebanon, president, and Dr John L Steffy, Brookline secretary This will eventually become a branch of the Allegheny County Medical Society

Personal—Dr Clair B Kirk, Mill Hall, has been made chief of the tuberculosis dispensary at Lock Haven——Drs Edwin D Schnabel Bethlehem, and Thomas J Butler, South Bethlehem, are president and secretary, respectively, of the Physicians' Club of Bethlehem, recently organized——Dr John F Norris, for several years superintendent of the Somerset Home and Hospital, has resigned——Dr John B Critchfield, Lock Haven, has been appointed state medical supervisor of the state department of health, succeeding Dr John Herbert Waite, Flemington, resigned

Chester to Get Hospital—Another hospital to be known as the Robert H Crozer Hospital will be erected on the grounds of the Chester Hospital and will be deeded to that institution for ninety-nine years The agreement reached ended a long series of conferences between the executors of the Crozer will and the Chester Hospital managers regarding the bequest of $200,000 made by Crozer in his will several years ago for the erection of a hospital in Upland or Chester Since his death the amount has increased to $240 000 and the executors declared their intention of making available the fund for the immediate erection of a hospital

Philadelphia

More City Nurses Needed—A shortage of nurses to care for the city's insane has led the director of public health and charities to ask the city's civil service commission to waive citizenship and residence requirements in order to obtain the services of Canadian nurses

Blockley Interns Appointed—The following men have been appointed to the resident staff of the Philadelphia General Hospital Drs Furman Angel, John S Floyd, Charles A Heiken, Alfred B Nesler Robert L Crogan, Duma C Arnold, Joseph A Kervin, Frederick W Mulsow, Russell O Lyday and Adam R Blakey

Personal—Dr Charles H Frazier has accepted a commission in the Medical Reserve Corps, U S Army to attend the Interallied Surgical Conference to be held in Paris, July 18 to 23 He will make a report on the activities of the Neurosurgical Department of the Surgeon-General's Office during the period of reconstruction

Health Survey—The department of public welfare according to an announcement made by its chief physician, Dr Blair Spencer, will make a health survey of all girls and boys who go to the health centers of the city Two physicians will be appointed to hold a clinic at ten recreation centers the object being to discover any incipient illness among children and to guide them in treatment and exercises most beneficial to them

Plans for Special School—Plans have been completed by the University of Pennsylvania for the establishment of a special school of advanced training in medicine and sur-

gery to be opened in the coming autumn which will accommodate not only the graduate student who wishes to pursue his studies further, but also the trained surgeon and physician who wishes to extend his training Two hundred physicians and surgeons will comprise the staff of the new school, which will open, October 4

Bill to Regulate Drives and Campaigns—In the twenty months that have elapsed since the armistice was signed the people of Philadelphia have contributed $20 000,000 to "drives" of all kinds according to figures compiled in connection with the introduction in the city council June 29, of an ordinance to regulate the solicitation of funds for charitable purposes This bill will require organizations conducting drives for funds to file with the department of public welfare complete information in regard to the proposed use of the money collected it will require solicitors to apply for a license and pay a fee and it will empower the director of public welfare to investigate individuals and organizations filing applications

CANADA

Personal—Dr Marchant B Whyte Toronto director of medical service in the department of public health has resigned, to take effect September 1

Vital Statistics for Quebec—According to figures just issued the province of Quebec with a total population of 2,500,000 had 77,915 births in 1919 as against 82 521 in 1918 and 80 361 in 1914 The marriages reached a record number—21,997—there being only 12 031 in 1918 In 1919 the number of deaths amounted to 40 917, which is about equal to 52 per cent of the births

Federal Health Department—Owing to the retirement of Hon Newton Wesley Rowell from the ministry of health, doubt is expressed as to the future of the department There is every likelihood with the advent of a new ministry for the dominion that some of the departments will be consolidated and it is feared by high medical officials that the department of health may be merged in some other department

GENERAL

Gold Medal Awarded to Dr Souchon—The Committee on Awards at the New Orleans Session awarded the Gold Medal of the Scientific Exhibit to Dr Edmond Souchon of New Orleans for his exhibit of anatomic dissections In acknowledging the receipt, Dr Souchon writes

> The beautiful gold medal came this morning I received it with great joy as the crowning glory of my declining years In a few months I shall be 80
>
> This work is my Song of the Swan as I will not likely be able to do any more of it My endurance is fast ebbing away
>
> With kindest regards EDMOND SOUCHON M D

District Society Meeting—The annual meeting of the Iowa and Illinois Central District Medical Society was held in Davenport, July 8 Dr Gordon F Harkness Davenport, Iowa, was elected president, Dr John W Seids Moline, Ill, vice president, Dr William D Chapman Silvis, Ill secretary, and Dr William D Snively, Rock Island, Ill, treasurer

Meetings to Come—The annual meeting of the Lake Keuka Medical and Surgical Association will be held at nished by Florence Swift Wright, chairman of the section, 156 Fifth Avenue, New York

Catholic Hospital Association.—The annual meeting of the Catholic Hospital Association was held at St Paul June 22-24 Many of the Catholic hospitals were represented by groups of sisters There were also a number of physicians in attendance Special interest was shown in the shortage of nurses and a committee was appointed to suggest ways and means by which more student nurses could be recruited The association is now publishing a monthly journal entitled *Hospital Progress* and reports indicate an increased membership in the association both by institutions and individuals The election of officers resulted in the renaming of Rev C B Moulinier, as president, and Charles F McGrath, as secretary

Yellow Fever Investigations in Central America to Be Continued—In a report on the work of the Rockefeller Institute for Medical Research during 1919, Dr George E Vincent comments on the work in connection with the origin and treatment of yellow fever No cases of yellow fever have appeared in Guayaquil since June 1 1919 while from 1912 to 1918 the city averaged 259 cases annually, and there were 460 cases in 1918 The report announces that vigilance will not be relaxed for a year at least The commissions created in Central American countries to regulate control measures will be continued through the year. Dr Hideyo Noguchi, New York, will test the results at Guayaquil by further investigations at other places

The Child Welfare Special—The Child Welfare Special is a large government truck that is being used as a movable child welfare station for the purpose of carrying to remote regions the principles of child hygiene It was built especially for this purpose and follows in a general way the construction and equipment of the traveling dispensaries used in a number of the large cities of the country The truck has been in operation since July 1919 and in the meantime it has inspired welfare organizations in several communities to duplicate and augment the efforts of the government in furthering child hygiene The Children's Bureau of the U S Department of Labor has just issued an illustrated pamphlet outlining the purposes and giving a detailed account of the workings of the Child Welfare Special and it is ready to lend all possible assistance to related endeavors

Scientific Research—Under the auspices of the federal government thirty-five scientific researches are being conducted simultaneously in the leading laboratories of the United States for the discovery of more effective measures in the treatment and prevention of venereal disease These include researches at the State University of Iowa College of Medicine, on a selective medium for the isolation and cultivation of the gonococcus, at Northwestern Univer[illegible] Department of Chemistry a synthesis of new organic mercury compounds for use in the treatment of syphilis of the central nervous system, at Washington Univer[illegible] School, a study of hereditary and congenital [illegible] particular reference to the progre[illegible] of the disea[illegible] individual and the effect of treatment at [illegible] of Harvard University a continuation of the [illegible] toxicity of arsphenamin and analogous [illegible] methods of manufacturing a[illegible] at Columbia University College of P[illegible] Department of Bacteriology New [illegible]

and 48 per thousand, respectively In Saginaw, Mich, and Brockton, Mass, where the proportion of foreign-born, illiterate and gainfully employed mothers was comparatively low, and incomes were more nearly adequate, infant mortality rates from gastro-intestinal diseases were only 8 and 12 per thousand, respectively

LATIN AMERICA

Plague in Mexico—It is reported from Mexico that one death from bubonic plague and two new cases were reported at Vera Cruz on July 12 It is also stated that there have occurred several cases of yellow fever

Personal—Dr E R Coni, the pioneer in public hygiene in Argentina, has been elected honorary member of the Havana Academy of Medical and Physical Sciences——Dr Juan Santos Fernandez of Havana has been elected corresponding member of the S Paulo Medical Society, Brazil——Dr F M Fernandez of Havana has been elected corresponding member of the Sociedad oftalmologica mexicana and member of the Sociedad academica de Historia internacional The two latter are director and editor of the *Cronica medico-quirurgica de la Habana*

FOREIGN

Race Biology Institute—It is announced that the Swedish parliament has appropriated 50,000 crowns for the yearly maintenance of the Rasbiologisk Institut at Upsala, of which Prof H Lindborg is in charge

Roentgen-Ray Injuries—The cable reports that the radiologist, Dr C Infroit, of Paris, had to have his remaining arm amputated on account of roentgen-ray injuries This is the twenty-fourth operation he has had to undergo since 1898

Brazilian Hospital Transferred to France—The hospital installed by Brazilians in Vaugirard, France, at a cost of $2,000,000 has been offered by the government of Brazil to France and has been accepted by the Paris Faculty of Medicine

Marriage and Disease—The new Danish marriage law is up for its third reading in the Folketing (Lower House) after which it will go to the Landsting (Upper House) for consideration The committee having the draft in charge is unanimous in approving the following provisions

1 If the person who wishes to contract a marriage does not suffer and has never suffered from venereal disease he shall give a written declaration on his honor to that effect

2 In the opposite case he must either put in a doctor's certificate made within the previous fortnight that the danger of infection or its transmission to the children is most improbable or

3 If such a declaration cannot be made he must prove that the other party to the marriage has been informed as to the disease and that both parties have had oral instruction from a doctor as to the dangers consequent thereon

Deaths in Other Countries

Dr de Pezzer, a well known urologist of Paris——Dr Susano Almado of Montevideo, a leader in the fight against tuberculosis, aged 50——Dr J F Fuste of Placetas, Cuba ——Dr Cayetano Vilalta of Manbanillo, Cuba, and Dr A Lobato of Havana, both members of the national legislature

CORRECTIONS

Dose of Arsphenamin—In the article by Dr Oliver S Ormsby, Chicago, THE JOURNAL, July 3, page 4, second column, it is stated that frequently repeated small doses, that is from 0 1 to 0 5 gm, are inefficient The figures should be 0 1 to 0 15 gm

Society Election—In the May 29 issue of THE JOURNAL it was announced that Dr Warren G Patton, Cape Girardeau, had been elected president of the Southeastern Medical Association The new president of the association is Dr William G Patton of Cape Girardeau

Treatment of Anthrax—In an article on "Anthrax," THE JOURNAL, May 22 page 1441, Dr Albert J Scholl, Jr, Los Angeles, states that Regan reports a successful case and suggests phenol injections at the site of the wound The statement is an error We are informed that Regan used anthrax serum locally

Interstitial, Not Epithelial—In THE JOURNAL, June 19, page 1748, the abstracter quotes Ishibasi *Mitteilungen a d med Fak d kais Univ*, Tokyo, to the effect that he finds no relation between the total amount of the interstitial cells and the secondary sexual characters, but erroneously uses the words 'epithelial cells" In the abstract, the word 'interstitial' should be substituted for 'epithelial'

Government Services

Colonel McCoy Honored

John C McCoy, Lieut-Col, M C, U S Army, Paterson, N J, was decorated with the Distinguished Service Cross at Governor's Island, April 30 Colonel McCoy was cited for exceptional bravery under fire at a hospital at Joug-sur-Nurin and at Chateau-Thierry, where he commanded Red Cross hospitals

Funeral Honors to General Gorgas

Unusual honors were paid July 9, at the funeral ceremonies of Major-General Gorgas in St Paul's Cathedral King George V was represented by Sir Thomas Herbert John Chapman Goodwin K C B, C M G, D S O, and a salute of thirteen guns was fired as the procession started from Queen Alexandra Military Hospital The procession was led by the Coldstream Guard band followed by detachments from the Coldstream Guards, the Life Guards and other military organizations Representatives from all the allied powers and from scientific organizations of England and the continent were honorary pallbearers

Rapid Test for Butter Fat

Dr Icard of Marseilles, speaking before the Societe de pathologie comparee, recently called attention to a practical method for examining milk, especially applicable to the milk of wetnurses A drop of milk is placed on a piece of paper, which is placed across the two branches of a hair-pin resting on an iron spoon This is then held in an alcohol or gas flame or over the globe of an oil-lamp, for from three to five minutes or until the drop of milk has dried and has assumed a dark caramel tint, almost black At this moment it will be seen that a dark caramel spot is surrounded by a bullous halo, which can be clearly distinguished The diameter of this halo is proportional to the butter fat content of the milk A good cow's milk will give a halo nearly three times that obtained with a drop of ordinary milk

The procedure will be especially valuable in examining wetnurses It will give very reliable information about the nutritive value of the milk and it will make it possible to determine the variations in fat content during the nursing period and especially under certain physiologic and pathologic conditions (menstruation, pregnancy and various diseases) The halo obtained with a drop of good human milk is always smaller than that with a drop of good cows milk The same procedure may also be applied to the examination of cheese, but the halo is much larger, owing to the greater fat content

The Physicians of Alsace

Alsace is still under a transition government, which has occasioned considerable difficulties, especially emphasized in regard to the status of Alsatian physicians Most of these are graduates of the German faculty of Strasbourg, and have not up to the present time been authorized to practice elsewhere than in Alsace-Lorraine During the World War, many of them gave their services to France in Red Cross hospitals and by attending the civil population

At the armistice however, it was determined that they could not practice medicine in France, and they therefore returned to Alsace At that time a demand was made that the question of recognizing the Strasbourg diploma as equivalent to the French diploma be settled as soon as possible Up to date nothing has been done about it

The Association de la presse medicale française at its last meeting displayed considerable agitation over this state of affairs, and adopted a motion requesting early settlement of the question by Parliament The resolution was sent to the medical members of Parliament and these will take prompt steps to improve the status of their Alsatian confreres

The Public Health Budget

Dr Roux, director of the Pasteur Institute of Paris at a recent meeting of the Academie de medecine, remarked on the fact that the budget of the Ministere de l'hygiene, assistance et prevoyance sociale carries 105 000 000 francs for relief and only 2,730 000 for hygiene This disproportionate appropriation for public health work shows that the care of the sick has until now outweighed the prevention of disease, a policy which should not be continued To care for the sick is good but to prevent disease is still better If it is hoped to reduce, some day the expenditures for charity it is necessary to start now by increasing the appropriation for public health work The Academy adopted a resolution requesting an increased budget for hygiene and a reorganization of the service along lines which will best serve the public good

Epilepsy Prize Competition

On several occasions, attention has been called to an important international competition for a prize of 100 000 francs offered by an anonymous donor to that investigator who should effectively disclose by clinical study, and if necessary by experiment the pathogenesis and treatment of nervous diseases especially epilepsy The competition lasted during 1913-1919, but the capital prize was not awarded However three papers were retained and were deemed worthy of reward one by Dr Dujardin Brussels, another by Drs Bouche and Hustin, Brussels and a third by Drs Dide and Guiraud, Toulouse

Committee on Day Nurseries

At the time when the first hot spell threatened the recrudescence of infant mortality, M Raux prefect of police called a meeting of a number of presidents of Paris day nurseries in order to coordinate the efforts of the various agencies interested in the protection of infant life In Paris, there are more than 160 nurseries established through private charity, not counting those attached to factories or the milk stations ("gouttes de lait") which render splendid services to infants in the populous centers In each of these nurseries more than twenty infants are cared for and fed

The prefect of police conceived the idea that it would serve a useful purpose to organize the presidents of these agencies into a Comite consultatif des creches This new committee will occupy itself with the development of breast feeding, it will study the difficulties and advantages of artificial feeding and will make recommendations regarding feeding bottles cradles and other articles employed in the care of children Those nurseries which play a passive role will have a new field of activity in the teaching of hygiene directly to mothers Finally when children are found in a bad state of health because of insanitary housing conditions the nurseries can refer these to the attention of the prefect of police who will be able to suggest correction of the evil by the property owner

LONDON

(From Our Regular Correspondent)

June 26 1920

The Revolution in Medical Service

The revolution in the medical service of the country described in a previous letter was the subject of an address by Lord Dawson of Penn to a branch of the British Medical Association It may be remembered that he is chairman of the Consultative Medical Council appointed to advise the ministry of health, which brought forward the scheme He pointed out that the health of the citizen was now seen to be of supreme importance and it was agreed that organized measures must be taken for securing it A series of whole-time services had been set up one by one The school service for example had become almost a detached service with a certain number of physicians earning their living entirely as school medical officers More recently there was set up a tuberculosis service then a venereal service and lastly a maternity service The second evident fact was that physicians today were not in a position to do or give the best for their patients along purely individual lines In his hospital days a man had every facility for following up his cases in the various departments he could look at the roentgen ray image he could see the testing of the secretions and could go into the operating theater and the postmortem But on going into practice he dropped suddenly [illegible] limited opportunities of an office in a private [illegible] he went to the home of the people the [illegible] were often such that he could not do [illegible] of medicine right through the [illegible]

organization and provision The insurance act was one endeavor to bring medical treatment within the reach of the people more completely than before, but if the best means for the treatment of the community were to be made available, the range of benefit must not be restricted to insured persons The state could not be asked to make those means available only for one section of the community The reference to the Consultative Council was therefore to suggest ways whereby the medical services of the country could be so systematized as to provide what should be made reasonably available for all members of the community The recommendations were designed to secure (1) the provision of buildings and equipment, (2) services correlated and made available for all, (3) opportunity for physicians to do their best work and further their knowledge, (4) coordination of preventive and curative medicine and (5) freedom of action for physician and patient It was difficult to combine all these ideals If the point of view of the administrator alone were considered, recourse would be to a whole-time service But that was felt not to be the best thing in the interest of the health of the community The correlation of preventive and curative medicine was most important, and at present the physician was not identified closely enough with prevention and with the maintenance of communal health He had yet to be brought into contact with the preventive services The higher posts in such services must necessarily be in the hands of specialists, but the physician, nevertheless, must somehow be identified with preventive work With the advance of knowledge, the line of demarcation between prevention and cure became increasingly blurred A further principle on which the council had acted was that the work of a district should as far as possible be performed by the physicians of that district, who should be paid on a part-time basis This in itself would bring preventive medicine more under the ken of the general physician Then, it was realized also that the physicians must have opportunities of following up cases and investigating disease from different standpoints The work of medicine was becoming less the work of an individual, and more the work of a team An increase of institutional provision was therefore indicated What was suggested was new, there was no experience from any other country to guide them, indeed other countries were watching the experiment with a view to imitating it The term 'health center" was employed because something bigger and more embracing was desired than the term 'hospital" The center might be defined as an organization to bring together the curative and preventive services of a given district In a typical instance it might contain fifty beds, with certain clinical accommodation where consultations might take place and patients be seen other than those in the beds, also a roentgenographic room, a laboratory and other departments, and a common room where physicians could hold meetings The essential thing about the primary health center was that it should be staffed by the physicians of the district, and that when a patient left his home and went into the clinic he would be followed there by his own physician The primary health centers in a given area would be connected with a secondary center, which instead of being staffed by physicians would be staffed by consultants or by physicians acting in a consultative capacity Then to complete this ideal arrangement the secondary centers would be linked with a teaching hospital which would be scheduled as a national institution with a 'zone of influence" attaching to it

The Medical Curriculum

The General Council of Medical Education is discussing the reform of the medical curriculum Sir George Newman, principal medical officer of the ministry of health, whose official memorandum on medical education in England has attracted much attention, put in a plea for the importance of the preliminary science subjects in relation to clinical medicine and surgeory He thought it desirable to strengthen these science subjects rather than weaken them Chemistry, physics and biology were continually becoming more closely allied to clinical work He laid down six points for consideration in connection with that broad and generous revision—he would not say revolution—of the curriculum which the time was more than ripe for the council to discuss His six points were 1 The curriculum ought to be lightened at both ends We were not giving our students time to think or digest. True culture or learning was never forthcoming on the principle of the general scrimmage 2 An endeavor should be made to coordinate the preliminary scientific and intermediate subjects with each other and with the clinical, and to make the preliminary scientific subjects much more applied 3 The reorganization of clinical teaching must be considered In America and Germany he had seen no clinical teaching to compare with the best in this country, but our clinical teaching wanted reorganization so that the clinical teacher was in a position to give his best, and not a mere residuum 4 He would like to see the provision of ampler education in four or five particular subjects, namely, venereal diseases, tuberculosis, maternity and infant welfare, orthopedics and mental diseases 5 There must be some kind of postgraduate equipment, first for dealing with specialism, and secondly, for insuring the continued education of the student 6 He would put in a plea for a reform of the examination system The examination system must follow the training, not lead to it It must include the preparation of the student, not exclude it It must represent not a hazard but a certainty It must be an instrument by which the center of gravity was thrown upon the curriculum rather than upon the examination room itself This would alter the whole outlook for the student He would see that his education was not a scrimmage for an uncertain goal, but a course of study for a final destiny

BELGIUM

(From Our Regular Correspondent)

June 16, 1920

Rationing of Belgium During the War

M Demoor this time in collaboration with M Slosse, has published another study on the food conditions in Belgium during the war, and the disastrous consequences to the population The conclusions of this contribution are very interesting from a physiologic and sociologic point of view They are based on the results of an impartial scientific investigation by one with a strict professional conscience He brings out the fact that the average daily ration for a man was equivalent to from 1,400 to 1,500 calories with 35 gm of protein (largely vegetable) This diet, decidedly below requirements caused serious impairment of the health, as observed in 1916 by Professor Lucas, a representative of the American Commission to Belgium, in a report to Mr Herbert Hoover The work is of special social and political import and deserves attentive perusal, all the more so as certain data are apparently in direct contradiction to the findings of Professor Starling during his investigation in Germany A fairly complete version of the official resume published by the Royal Academy may therefore be of some interest

The Comite National, which managed the food rationing, understood from the beginning of hostilities that after giving all of Belgium the largest ration which could possibly be distributed (it is now seen that it was insufficient), it must seek especially to protect and sustain the children

It undertook the feeding of all infants from 0 to 1 year, and granted a supplementary ration to pregnant women and

to nursing mothers Later it provided extra meals for debilitated children In February, 1918 it distributed 11,343,000 varied meals of from 600 to 825 calories, to children between 3 and 16 years From 1916 to the end of the war, school lunches consisting of 70 gm of bread, 5 gm of lard, and milk (when available) were provided for 1,174,000 children This then constituted the dietary of the Belgians during the war, an insufficient regimen in fact, which could only lead to much misery Some selected facts among those recounted by the various authors will justify this assertion

INFANTS UNDER ONE YEAR

Thanks to the special measures of infant care, enteritis practically disappeared and infant mortality fell off in 1915 and 1916 In the following two years, the figures again increased without, however attaining the proportions of the period before the war But the decreased mortality does not prove that the children were more robust than normally or that the general diet was good As a matter of fact the weight of new-born infants averaged only 2,500 gm at birth (Antwerp and Brussels) as compared with the prewar average of 3,000 gm, and there was an increase of mortality from congenital debility Their physical development (height and weight) was inadequate On the whole while the lives of living children may have been protected, the unborn children came into life with marked unfavorable heredity

CHILDREN FROM ONE TO SIX YEARS

The incidence of rickets increased markedly and attained proportions hitherto unknown in Belgium

CHILDREN FROM SIX TO FOURTEEN YEARS

In this age group development was greatly retarded and the average weight and height for the various ages at the end of the war was below normal by a figure corresponding to the growth of one full year In the course of the four years of war then, the average child lost one year in physical development Dr Dubois figures show that the same was true in Liege

CHILDREN IN ORPHAN ASYLUMS

The orphans were given a special examination in May, 1918 In two orphanages at Herenthals for example, the dietary yielded a total of 1341 calories (30 gm of protein and 17 gm of fat) in one and 1871 calories (58 gm of protein) in the other Now in the first orphanage two thirds of the children were below the normal height and weight, and in the second one half of the inmates were subnormal So then, in spite of all the special care which they received these two groups comprised three fourths or one half of children with serious physical impairment Before the war, in a communal school of the poorest quarter of Brussels, only one fourth of the children showed as much impairment.

ADULTS

The mortality rate of adults increased during the war slightly in 1916 but more in 1917 and 1918 Influenza and tuberculosis undoubtedly made great inroads but deaths from renal and cardiac diseases were also much more numerous Immunity processes were lowered and the body's resistance against disease was enfeebled Undoubedly adults were greatly reduced in robusticity the average loss in weight for men in Brussels and Liege being 10 kilograms In 1916 among 600 inmates of an agricultural colon for the insane in Gheel an average loss in weight of 4.2 kg was noted. These facts are brought out by Drs Denoor and Slosse who discussed at the same time a British parliamentary report by Prof E. H Starling on his investigations in Germany after the armistice. Professor Starling claimed that the average food allowance per man in Germany was 1,500 calories, plus 200 calories (from cultivated legumes) plus 300 calories extra for workingmen (45 gm of protein, and from 15 to 20 gm of fat) He contended that this ration was deficient and he showed that the general health was impaired and that both children and adults were suffering The London physiologist compared the present German ration and its consequences with that which he believes to have been the Belgian ration during the war According to him the program of the American Commission during the war provided a ration averaging 2842 calories per man (2,274 calories per inhabitant) and that the Belgians were not much impaired and cases of undernutrition were rare

The Belgian professors are asking their English colleague why he did not get direct information on the real facts about the rationing of Belgium Of what significance is a program? In times of war, ship arrivals are irregular and agricultural and other products are constantly commandeered by the enemy, therefore the food actually distributed and not that which it was planned to provide should be considered As a matter of fact the Belgian subsisted on from 1,400 to 1500 calories during the war

If Professor Starling had made the same inquiries in Belgium that he made in Germany he would have found that tuberculosis and debility have increased considerably and that all the misery described by Professor Lucas, in 1916 became accentuated in 1917 and 1918 He would have encountered the populace overwhelmed by ruthless invaders preserving their moral strength in opposing the enemy though physically they were much enfeebled and tottering Such an inquiry would have prevented inclusion of the erroneous conclusions regarding Belgium

MEXICO CITY

(From Our Regular Correspondent)

July 4 1920

Decrease of Plague Epidemic

According to the official data from June 18 to June 25 there were at Vera Cruz only seven new cases and three deaths of bubonic plague making a total of forty-six cases and twenty-nine deaths from the beginning of the epidemic From June 25 to July 2 there have been no new cases, and in view of the energetic measures being carried out, it is to be hoped that no more cases will occur However the epizootic has not subsided since the plague bacillus has been found in two of the trapped rats As a result the deratization measures are being pushed and the department of public health in order to prevent new invasions is going to establish at Vera Cruz a permanent deratization service Aside from the original focus at Vera Cruz no others have been discovered and a general campaign against rodents in this capital and other places has been carried out only as a precautionary measure

Mexican Medical Association

Our association has established its headquarters at No 18 Avenida Juarez. In order to celebrate the opening as well as the first anniversary of its foundation the association will give a concert for physicians and their families There has already been published the first number of the *Bulletin* of the association which so far is only an organ for propaganda and information As it is intended that the journal of the association will keep abreast of similar foreign publications it has been decided to postpone its appearance until the necessary elements are available.

In Honor of Dr Liceaga

The National University the Mexican Medical Association the Academy of Medicine and other scientific bodies recently joined in funeral services in honor of Dr Liceaga who died in the early part

memory as a scientific and public official we try to keep alive as a model for future generations On its part the Department of Public Health has rendered homage to Dr Liceaga, placing his portrait in its assembly hall On this occasion the chief of this department, Dr Malda, a pupil and admirer of Dr Liceaga, spoke on the virtues that distinguished the latter

Personal

Dr Enrique Gonzalez Martinez, a well known writer and former undersecretary of public instruction, has been appointed minister of Mexico to Chile, and will leave very soon for Santiago ——Nothing is known about the whereabouts of Dr Alfonso Cabrera, former governor of the state of Puebla, who had to abandon his capital during the last revolution Dr Cabrera always took an active interest in everything pertaining to the profession He contributed greatly to the success of the Fifth National Medical Congress, founded and supported for two years the *Revista Medica,* had a law adopted regulating the practice of liberal professions, and during his term of office some "healers" were sent to jail for practicing medicine illegally, which is an unusual occurrence in this country ——Dr Alfredo Caturegli has been appointed Mexican financial agent in New York ——Dr A Lara N has been designated as head of the School of Medicine of the State of Yucatan ——It is expected that in the near future there will return to this country Dr F Vasquez Gomez, now of San Antonio, Texas, who was a former candidate for the vice presidency of Mexico, and Dr Fernando Zarraga, former dean of the School of Medicine, now of Los Angeles Both had to leave several years ago on account of politics

Marriages

FRANK IGNATIUS STUART, Independence, Mo, to Miss Minnie Ruth McLaughlin of Monticello, Iowa, June 29

ABRAHAM LEBENDIG, Rochester, N Y, to Miss Mamie E Spoont of Shenandoah, Pa, at Rochester, June 29

OLIVER H KELSALL to Miss Dorothy May Dietzmann, both of Louisville, Ky, at New Albany, Ind, June 22

WILEY WARREN JOHNSTON, Winston-Salem, N C, to Miss Bess Swearnghan of Charlotte, N C, June 10

WILLIAM OTTERBEIN ROOP, Atlantic City, N J, to Miss Emma L Taylor of Jackson, N C, June 26

SYLVESTER C E ALLEN Waterloo, Wis, to Miss Mercy Rockwood of Oshkosh Wis, June 19

FREDERIC GEORGE MAURER Lima, Ohio, to Miss Odilia Ann Neumeyer of Toledo Ohio, June 19

STEPHEN PASCHAL KENYON, Dawson, Ga, to Miss Lucille Hooper of Atlanta, Ga June 16

RAY HOSKIN RULISON to Miss Mildred Fowler Gignoux, both of Monroe, N Y June 28

HENRY KAPLOVICH, Haverhill, Mass, to Miss Lillian Cohen of Somerville Mass, June 1

GEORGE B RANDALL, Buhl, Idaho to Miss Mathilda Bohr of Pocatello Idaho June 10

BENJAMIN AUGUSTUS to Miss Anna Beatrice Davidson, both of Chicago recently

ROY ROBERT HALEY to Miss Mary Katherine Erwin, both of Brookfield Mo June 28

EU YOUNG KAU, New York City, to Miss Mabel F J Tyau of Philadelphia, June 16

JAMES LOUIS LOCASCIO to Miss Olga Marie Elliott, both of New Orleans, June 23

SOLOMON BILOON to Miss Fannie R Levin, both of New York City, June 20

BENJAMIN KADISH to Miss M Saplitzsky, both of Chicago, June 27

JACOB RUCHMAN to Miss Edith I Max both of Brooklyn, June 27

Deaths

Joseph Oakland Hirschfelder ⊕ San Francisco, University of Leipzig, Germany, 1876, aged 65, died, July 4 After studying for two years at the University of California and a year at the Medical College of the Pacific, he completed his medical studies at Wurzburg, Berlin and Leipzig On his return to America in 1877, he was made professor of materia medica and clinical medicine in the Medical College of the Pacific, San Francisco, and continued as professor of clinical medicine throughout the life of Cooper Medical College from 1882 until its absorption by Leland Stanford, Jr, University, when he become emeritus professor Working with General Sternberg, he was one of the first in this country to confirm Koch's findings of the tubercle bacillus In his latter years he devoted himself chiefly to experimental medicine His work was all done in his own laboratory at his own expense, with tireless devotion and thoroughness His methods were largely original and his experimental resourcefulness excellent He was a keen diagnostician and warm-hearted physician, and held for many years a leading position as a practitioner and consultant

Adolph Alt ⊕ St Louis, University of Heidelberg, Germany, 1875, aged 69, a member of the American Academy of Ophthalmology and Oto-Laryngology and American Ophthalmological Society, professor of ophthalmology in Beaumont Hospital Medical College, St Louis University Medical School, and Washington University, and professor emeritus in the latter institution since 1917, a veteran of the Franco-Prussian War, oculist and aurist to the St Louis Mullanphy Hospital, and consulting oculist to several hospitals of the city, died, June 28, from heart disease

John Henry Curtis, New Britain, Conn, University of the City of New York, 1886, aged 56, for twelve years professor of therapeutics in the College of Physicians and Surgeons, Chicago, for several years an official of the Chicago Health Department, who went to New Britain in February as superintendent of the local department of health, died, June 26, from embolism

William Hamilton Lambert, Moosejaw, Sask, University of Toronto Ont, 1893, aged 51, major, R A M C, during the World War, with service in Asia Minor and Egypt, and since the war president of the examining board at Moosejaw, and consultant in diseases of the eye and ear in the Military Hospital, died, June 11, from nephritis

Charles Arthur Pauson ⊕ San Francisco, University of California, San Francisco 1907, aged 38 captain, M C, U S Army, and discharged March 26, 1919, died in Mount Zion Hospital, San Francisco June 29 from acute congestion of the brain and lung due, it is said, to a local anesthetic, injected preparatory to a tonsillectomy

Marion Tracy Davis ⊕ Atlanta, Ga, University of Maryland Baltimore 1892, aged 51, formerly a member of the staff of the Grady Hospital Atlanta, died June 26, from the effects of a gunshot wound of the head, believed to have been self-inflicted, with suicidal intent, while despondent on account of ill health

John D Sourwine ⊕ Brazil, Ind, Central College of Physicians and Surgeons, Indianapolis 1896, aged 67, local surgeon for the Big Four system, said to have been the builder of the first traction line in the United States, formerly a druggist, postmaster of Brazil in 1884, died, June 26, from heart disease

James Stratton Carpenter, Pittsville, Pa, University of Pennsylvania, Philadelphia, 1882, aged 61, local surgeon for the Pennsylvania system since 1889, surgeon of the Eighth Infantry, N G, Pa, from 1885 to 1895, president of the Schuylkill County Medical Society in 1889-1890, died, July 3

Oscar Baker Steely ⊕ Pocatello, Idaho, Jefferson Medical College, 1891, aged 58, formerly president of the Idaho State Board of Health, a member of the Association of Military Surgeons of the United States, division surgeon of the Oregon Short Line, died June 27, from angina pectoris

Delbert Joseph Miller ⊕ Alliance, Ohio, University of Michigan Ann Arbor 1888, aged 57 died at the home of his brother, near North Benton Ohio June 29, from the effects of a gunshot wound, self-inflicted, it is believed, with suicidal intent while suffering from melancholia

George W Thomas, Chester, Pa, Howard University, Washington, D C, 1908, aged 45, a colored practitioner,

⊕ Indicates Fellow of the American Medical Association

and a member of the staff of Douglas Hospital, Chester, died in Chester Hospital, June 18, from surgical shock a few hours after an operation for appendicitis

Ellsworth S Blythe, Allen, Texas, Vanderbilt University, Nashville, Tenn, 1884, aged 61, a member of the State Medical Association of Texas, died in a sanatorium in Dallas June 14, from malignant disease, for which an operation had been performed four days before

John Calvin Fulton, Bluffton, Ind (license, Indiana, years of practice, 1897), aged 75, a practitioner for more than fifty years, a member of the Indiana State Medical Association, a veteran of the Civil War, died, June 22, from carcinoma of the intestines

Robert Shelby Cowan, Girard, Ill, St Louis Medical College, 1867, aged 87, a charter member of the Macoupin County Medical Society, a surgeon of Third Missouri Volunteer Cavalry during the Civil War, for three terms mayor of Girard, died June 18

Thomas Linton Price, San Francisco, Medico-Chirurgical College of Pennsylvania, Philadelphia 1897, aged 54, was found dead in a skiff at Wingo, Calif, June 19 Death is believed to have been due to heart disease, resulting from heat exhaustion

Joseph Burton Connell, Kansas City Mo, Kansas City (Mo) Medical College, 1887 aged 64, formerly professor of skin diseases in the Medical Department of the State University of Kansas, died in a sanatorium in Jacksonville, Ill, June 18

James C Stewart, Kansas City Mo Kansas City (Mo) Homeopathic Medical College 1895, aged 69, professor of visceral anatomy in his alma mater, formerly a builder and contractor, died, June 21, from the effects of roentgen-ray burns

Davison Hughes Ray, Bingham Canyon, Utah, University of Louisville, Ky 1907, aged 39, after his graduation acting assistant surgeon in the United States Public Health Service died at his country home near Bowling Green Ky, June 27

John Edgar Hathorn, Bartley, Neb, Rush Medical College 1874, aged 75, a member of the Nebraska State Medical Association, at one time a member of the state legislature, died, May 6, as the result of an automobile accident

William Austin Tomes, Brooklyn, College of Physicians and Surgeons in the City of New York 1891, aged 55, a member of the Medical Society of the State of New York, died, June 28 from carcinoma of the liver

Robert H Milnor, Warrensville, Pa, Jefferson Medical College, 1896, aged 52 a member of the Medical Society of the State of Pennsylvania, died in Hahnemann Hospital Rochester, N Y, June 24 from nephritis

Sidney P Hollingsworth, Washington D C, National University Washington, D C 1886, who had been in the patent business in Washington for many years, died June 18, in the Emergency Hospital, Washington

Edmund Oldham, Chatsworth, Ont, Queens University, Kingston, Ont, 1881, medical officer of the Thirty-First Regiment with rank of lieutenant colonel for twenty-five years, died June 8

George Thomas Northcutt, Seligman, Mo, University of Tennessee, Nashville 1896, aged 54, a member of the Missouri State Medical Association, died, May 18, from cerebral hemorrhage

Thomas W Duvall, Lynchberg Ohio Medical College of Ohio Cincinnati 1886, aged 55, a member of the Ohio State Medical Association, died May 21, from cerebral hemorrhage

Joseph M Wells ⊕ Trenton N J, Jefferson Medical College 1878, aged 63, for many years local surgeon for the Pennsylvania system, died, June 11, from cerebral hemorrhage

James Anderson, Hamilton Ont University of Toronto, Ont, 1880, aged 61, died recently at the Mayo Clinic Rochester, Minn after an operation for carcinoma of the throat

Sebastian Cabot Hatton, Riverton Iowa, College of Physicians and Surgeons, St Joseph Mo 1882 aged 71, died in the Jennie Edmundson Hospital, Council Bluffs, Iowa, July 5

Elijah H Hesterly, Cerro Gordo Ark (license, Eclectic State Medical Board of Arkansas 1903) aged 47 was accidentally drowned, while fording Little River, June 19

George David Arnold, Cleveland, University of Pennsylvania, Philadelphia, 1871, aged 71, a member of the Ohio State Medical Association, died in Mexico June 14

Donald A Kellogg, Sacramento, Calif Bellevue Hospital Medical College, 1889 aged 54, a member of the Medical Society of the State of California, died June 23

George Louis Ahlers, Pittsburgh, University of Buffalo, 1883 aged 55 formerly police surgeon of Allegheny, Pa, died June 21, from carcinoma of the stomach

John Wesley Blades, Hornell N Y, University of the City of New York 1881 aged 74, local surgeon for the Erie Railroad, died June 28 from heart disease

William P Patterson, Beauregard Miss, license, Mississippi State Board of Health, 1882, aged 82, died in Hattiesburg Miss May 1, from senile debility

Ernest A Bleuler, South Bend Ind, Washington University St Louis 1898, aged 60, died in Epworth Hospital South Bend June 12 from heart disease

Thelesphere Chagnon, Brooklyn, Long Island College Hospital Brooklyn 1894, aged 61, also a pharmacist, died, June 22 from cerebral hemorrhage

Thomas Cope, Nazareth, Pa, Jefferson Medical College 1869, aged 72, a member of the Medical Society of the State of Pennsylvania died June 26

Robert Joseph Thompson, Versailles Ky, Kentucky School of Medicine Louisville, 1870, aged 73, died at the home of his sister in Versailles, June 22

John Horner, White Water, Kan, Eclectic Medical Institute Cincinnati, 1880, aged 87, for fifty years a resident of Butler County, died June 19

George W Higbee, Sullivan, Ind, Homeopathic Medical College of Missouri St Louis, 1870, aged 78, a veteran of the Civil War died, June 12

Ernest C Brown, Madrid Iowa, University of Michigan Homeopathic Medical School, Ann Arbor, 1893, aged 53, died May 30, from tuberculosis

Sandford Reamy, Hot Springs, Ark, University of Louisville, Ky, 1851 aged 92, died at the home of his daughter in Hot Springs June 19

Quintus Emanuel Snyder, Frenchtown, N J, Bellevue Hospital Medical College 1868, aged 78, died, May 10, from progressive paralysis

John H Neese, Tremont City, Ohio, Starling Medical College Columbus Ohio, 1892 aged 64, died, June 15, from cerebral hemorrhage

Thomas McKenzie, Parkdale, Toronto, University of Toronto 1883 aged 55, lecturer in biology in his alma mater, died, June 2

Harry Lewis Connett, Athens Ohio, Johns Hopkins University Baltimore 1909, aged 38, died March 31, from pulmonary tuberculosis

George E Meredith, Lanesville Va University of Maryland, Baltimore 1886, aged 56, died June 10, from cerebral hemorrhage

John Moore, Sussex N J, College of Physicians and Surgeons in the City of New York 1866, aged 76, died April 30

John C Cooper, Carrollton Mo, University of Pennsylvania Philadelphia 1856, aged 87 died, May 2, from renal calculus

Ivey Goodman Riddick, Raleigh N C, Bellevue Hospital Medical College 1886, died recently from carcinoma of the throat

Victor Sisung ⊕ Monroe, Mich, Detroit College of Medicine and Surgery 1895, aged 52, died, June 27, from heart disease

George J Pickenpaugh, Unionville Mo Northwestern Medical College St Joseph Mo 1885 aged 64 died, June 9

Irving S Bretz ⊕ Cleveland College of Physicians and Surgeons 1897 aged 49 died, June 25 from heart disease

Julius B Thomas, Smiths Grove Ky, University of Louisville Ky 1870 aged 79 died May 13 from uremia

William H Price, Cartersville Mo license Missouri 1883, aged 79 for half a century a practitioner died June 14

Grant Newton, Dexter Mo, Chicago Homeopathic Medical College 1894 aged 52 died June 14 from dropsy

William Iseminger, Denison Iowa (license years of practice Iowa 1887) aged 83 died June 21

Nelson Cheney, Corning N Y Eclectic Medical Institute Cincinnati 1868 aged 84 died June 16

James M Moore Marietta Ga Medical College of Georgia Augusta 1871 aged 72 died June 23

The Propaganda for Reform

IN THIS DEPARTMENT APPEAR REPORTS OF THE JOURNAL'S BUREAU OF INVESTIGATION, OF THE COUNCIL ON PHARMACY AND CHEMISTRY AND OF THE ASSOCIATION LABORATORY TOGETHER WITH OTHER MATTER TENDING TO AID INTELLIGENT PRESCRIBING AND TO OPPOSE FRAUD ON THE PUBLIC AND ON THE PROFESSION

BORACETINE

"Boracetine," is manufactured by F E Barr & Co, Chicago In a large advertising campaign in the fall of 1919, it was heralded as "The Guardian of Health" Some of the claims made for the product were

'Recommended by Doctors and Dentists Everywhere'

'Boracetine keeps the mouth, throat and nasal passages clean and sweet and prevents the growth of germ life by antisepticiz ing the tissues and membranes of these parts'

"It is an *all around* antiseptic especially good for pyhorrea [*sic!*], sore gums sore throat, etc excellent for cuts bruises in sect bites skin eruptions and in fact any condition where an effi ient healing agent and germ de stroyer is needed"

In addition, the use of Boracetine was recommended to "get rid of that 'dark brown taste'" By inference rather than by direct statement the advertisements also claimed that Boracetine would prevent "influenza, consumption, scarlet fever, diphtheria, pneumonia, hay fever, bronchitis, measles and many other diseases" An original package of Boracetine was examined in the Association's chemical laboratory and the report of the chemists follows

CHEMISTS' REPORT

"A specimen of Boracetine (F E Barr & Co, Chicago) was examined and found to be a slightly yellow liquid having the odor of thymol or eucalyptol Both the odor and taste were much like that of the Antiseptic Solution of the National Formulary (*Liquor Antisepticus, N F*) The label declared the presence of 20 per cent alcohol

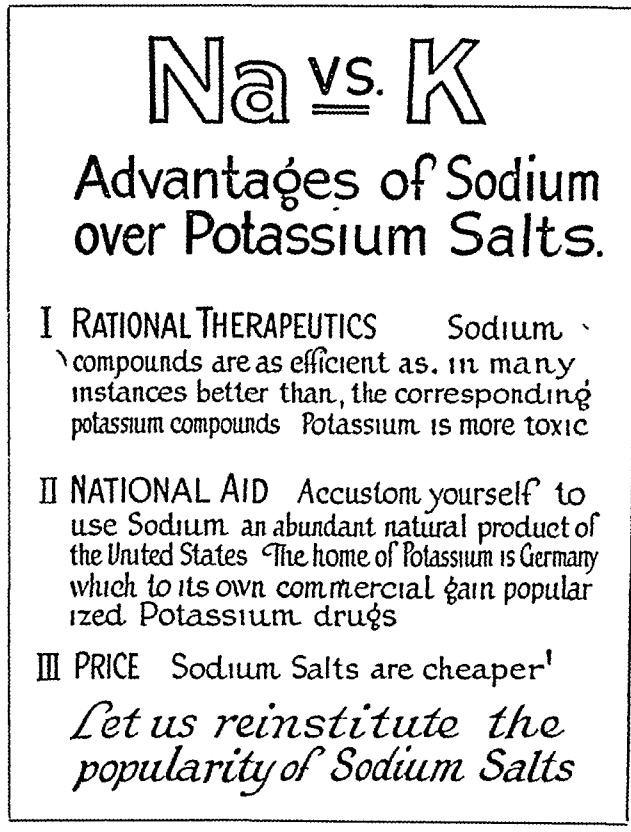
"Boracetine was found to have a specific gravity, at 25 C, of 0 9859 and was neutral or faintly acid to litmus Qualitative tests showed the presence of boric acid (some borate may also have been present), benzoic acid or a benzoate, formaldehyde, magnesium, sodium, traces of salicylic acid or a salicylate, some carbonate, and traces of some alkaloid When allowed to dry in a desiccator over sulphuric acid and phosphorus pentoxid Boracetine gave a residue amounting to 2 3 gm in 100 c c The total borate expressed as boric acid was 1 95 gm in 100 c c The total chloroform extract from strongly acidified Boracetine was 0 4078 gm in 100 c.c

"When extracted with chloroform, an oily residue was obtained, having, when dried spontaneously, a spicy odor suggesting both cinnamon and cloves Boracetine was acidulated with sulphuric acid, heated to expel alcohol and extracted with chloroform to remove oils, etc The acid solution was then made alkaline with ammonia water and again extracted with chloroform On evaporating the chloroform, a residue was obtained which, when dissolved in acidulated water, gave precipitates with potassium mercuric iodid, iodin solution, and phospho-molybdic acid These precipitates were about as dense as those obtained from a gram of ordinary alkaloids in a pint of water The amount of this residue was so small that its identification was not attempted

"Compared colorometrically by action of Jorissen's Reagent with a solution of formaldehyde of known strength, Boracetine was found to contain about one-tenth of 1 per cent formaldehyde From the above analysis it was concluded the Boracetine was a solution containing about 2 gm boric acid, about 0 5 gm sodium benzoate, about 0 1 gm formaldehyde in each 100 c c, together with aromatic substances, traces of some alkaloid and also sodium salicylate

"Boracetine is like the National Formulary antiseptic solution (*Liquor Antisepticus, N F*) in odor and taste Aside from the presence of formaldehyde, it is like it in composition also, since the N F preparation contains 2 5 gm boric acid, 0 6 gm sodium benzoate and 0 120 gm sodium salicylate in 100 c c, quantities which approximate those found in Boracetine"

From the chemists' report, then, it appears, that this preventive of consumption, scarlet fever, diphtheria, etc., this "efficient germ destroyer," is no more wonderful than some *Liquor Antisepticus, N F*, with a dash of formaldehyd The more "patent medicines" that are analyzed, the more obvious becomes the commercial wisdom of the nostrum interests in fighting formula disclosure Secrecy and mystery are indeed the backbone of the "patent medicine" industry Consider the woful state of the advertisement copy-writer who had to romance about *Liquor Antisepticus* with a dash of formaldehyd, but "Boracetine"—well, that's different! *Omne ignotum pro magnifico!*



This is a greatly reduced reproduction of one of numerous educational posters shown at the New Orleans session in the exhibit of the Chemical Laboratory of the American Medical Association Potassium as compared with sodium is relatively speaking a foreign substance in the body Potassium and sodium salts are prescribed mainly for the effect of the radicle they carry It is illogical therefore to administer *potassium* acetate or *potassium* bromid when *sodium* acetate or *sodium* bromid can more readily be given In spite of the smaller demand sodium salts are on the whole cheaper than potassium salts and should the medical profession prescribe the sodium salts more generally undoubtedly all of those that might be used in medicine would be less expensive than the corresponding potassium salts

Work for the Tuberculous—D A Stewart (*Am Rev Tuberc* 4 292 [June] 1920) remarks that a fairly general agreement as to the guiding principles of sanatorium treatment for pulmonary tuberculosis has been reached by men of experience These principles are as definitely standardized as those of surgery, but they are not as familiar to the medical profession or to the general public as the principles of surgery and they run counter to many old prejudices, as indeed the principles of modern surgery did a generation or more ago The essentials of the treatment of tuberculosis are frequently—and wrongly—stated to be 'food and fresh air" The real essential, as sanatorium men all know, is regulation of rest and exercise—of energy conservation and expenditure One tuberculous patient must not raise his hand to his head unnecessarily, another may do a day's work with benefit Between these two are ranged all who have active or even fairly arrested tuberculosis, and the placing of a man where he belongs is a matter of experience, study and skill He who can direct wisely regarding rest and exercise can treat tuberculosis He who cannot do this can only maltreat tuberculosis Only he who can bring to the treatment of tuberculosis thought, experience and skill, has a right to try to direct the treatment or after employment of the tuberculous

Correspondence

THE MEDICAL PROFESSION A SUBSTITUTE FOR THE SALOON

To the Editor —The following resolution was passed and signed by the entire membership of the Beloit Physicians' and Surgeons' Club It appears to me that this should be the stand taken by the physicians in general throughout the country, and as we are getting a "black eye" by the careless prescribing of intoxicating liquors, I wish you would publish this resolution

WHEREAS By constitutional amendment the United States has adopted a prohibition law and

WHEREAS The legal right to prescribe and dispense intoxicating liquor is in the hands of the physicians of our country be it

Resolved That we the members of the Beloit Physicians and Surgeons Club as patriotic citizens of the United States do hereby place ourselves on record as absolutely upholding the letter of the law and do hereby agree not to dispense or prescribe any intoxicating liquors except in cases of extreme need, that this club will aid the federal government in every way possible in the enforcement of this law

This resolution appeared in the Beloit *Daily News,* June 18, 1920 The Beloit Physicians' and Surgeons' Club has received numerous letters congratulating it on the stand taken in this matter, and I know it is the stand of the medical profession at large Certainly, the medical profession never will take the attitude of being a substitute for the saloon

C F N SCHRAM, M D, Beloit, Wis

PRELIMINARY NOTE ON A NEW AND PHYSIOLOGIC METHOD OF "ARTIFICIAL" FERTILIZATION

To the Editor —I desire to record a method of so-called artificial fertilization which I believe to be not only practicable but obviously advantageous in certain cases

In some instances of azoospermia it has been recommended to obtain the semen from some individual other than the husband, insemination being accomplished by injecting the fluid into the cervix Only an intense desire for progeny on the part of the female and complaisance on the part of the husband justifies this procedure The knowledge of the fact that the material is obtained from a heterogenous source is likely to be disquieting to a sensitive female, to say nothing of the unphysiologic nature of the process It is my belief that both of these objections can be overcome by the following simple method

A small incision can be made on either side, exposing the vas, as in vasostomy The seminal fluid from a healthy individual, which obviously is easily obtained, is to be injected into the seminal vesicle in precisely the same way as the colloid preparations of silver are used for the cure of vesicular infection Coitus may be performed immediately, or even within a reasonable period, thereafter, the act not being interfered with by the slight disturbance of the tissues incidental to the exposure and injection of the vas By this method the opportunity for impregnation is afforded in a perfectly natural and physiologic manner free from esthetic objections on the part of the female

In following the foregoing plan, the source of the spermatozoa may be revealed or not, at the discretion of the husband While I have performed no experiments as yet, I am of opinion that, granting a comparative freedom of the vesicles from infection, with a patent vas on the proximal side of the point of injection, the spermatozoa from an alien source probably will thrive quite as well in the vesicle of the recipient as in that of the donor The injected spermatozoa are not so "alien" to their new habitat as spermatozoa always are to the generative tract of the female It is evident that this method would be available only in selected cases In instances in which the seminal vesicles of the husband are seriously diseased and both vasa deferentia occluded above the point available for vasostomy, the method could not be used successfully When the sterility of the male is associated with sufficiently abnormal vaginal secretions which destroy the spermatozoa *the method would not be available* In cases in which not only is the husband sterile but also mechanical obstructions exist in the wife's cervical canal, the method could be supplemented by taking the semen from the vagina after coitus and injecting it into the uterus

My object in making this preliminary note is merely to put it on record, pending such opportunities as may present themselves to put it into actual practice Experiments to determine the feasibility of the method so far as concerns the conveyance of the spermatozoa during coitus are very easily accomplished

G FRANK LYDSTON, M D, Chicago

USE OF PITUITARY EXTRACT IN SECOND STAGE OF LABOR

To the Editor —I have just read, in the report of the meeting of the American Gynecological Society (THE JOURNAL, July 3 1920, p 56), the abstract of Dr Benjamin P Watson's discussion of induction of labor by the use of pituitary extract His attitude conveys the idea to my mind that the use of large doses of the drug, begun and repeated several times, before the cervix has become effaced, is perfectly safe This is so decidedly contradictory to my ideas that I cannot refrain from criticizing Dr Watson has been lucky if he has used this drug in the early part of the second stage for a long period of time with no evil results The use of a Voorhees bag is considered a better method by most obstetricians, unless I am much mistaken, and is preferable to the method suggested by Dr Watson I believe that this criticism is justified by the fact that were his suggestion accepted and followed by large numbers of practitioners, disastrous results might occur in many cases

RAYMOND L BRADLEY M D, Houston, Texas

Queries and Minor Notes

ANONYMOUS COMMUNICATIONS and queries on postal cards will not be noticed Every letter must contain the writer's name and address but these will be omitted on request

ECHINACEA

To the Editor —I have just received this circular What is the echinacea that will do such wonders? What is the evidence to warrant the claims? It ought to be easy to get the scientific evidence if there is any If you answer in THE JOURNAL, please omit my name

G S M D

ANSWER —The circular referred to by the correspondent is entitled Skin Lesions of Unknown and Uncertain Origin' It is devoted to the exploitation of Echitone a preparation put out by Strong Cobb & Co which is stated to contain echinacea blue flag and pansy Several years ago the Council on Pharmacy and Chemistry examined Echitone and rejected the product because unwarranted therapeutic claims were made for it and for other reasons (THE JOURNAL Jan 2 1915 p 70) The drug echinacea or purple cone flower has been claimed to be a specific for rattlesnake bite syphilis typhoid malaria diphtheria and hydrophobia Later enthusiasts have credited it with equally certain curative effects in *tuberculosis tetanus and exophthalmic goiter* as well as with the power of retarding the development of cancer In view of the extraordinary therapeutic claims made for echinacea in 1909 the Council [illegible] study of the subject and concluded [illegible]

dence was needed to warrant the use of this drug by the profession (THE JOURNAL, Nov 27, 1909, p 1836) In 1913 the Council reported that no satisfactory evidence of the therapeutic value of echinacea had been made available since the date of its previous investigation (THE JOURNAL, Jan 4, 1913, p 69) So far as can be learned to date, no reliable evidence for the claims made for this drug have been presented since the publication of the Council's reports Echinacea is one of the many vegetable drugs introduced by the eclectics without a rational basis for their use

LITERATURE ON LETHARGIC ENCEPHALITIS

To the Editor —Kindly give me references to articles on lethargic encephalitis HERMAN TROSSBACH M D Hasbrouck Heights N J

ANSWER—The following articles have appeared in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION during the last year

Loewe Leo and Strauss Israel Diagnosis of Epidemic Encephalitis May 15 1920 p 1373
Garnett A Y P Lethargic Encephalitis as a *Complication of* Pregnancy and Labor May 8 1920 p 1315
Encephalitis in Horses editorial, April 24 1920 p 1172

BLOOD AND RESPIRATORY CHEMICAL DETERMINATIONS

To the Editor —1 Please give the name of some small laboratory guide treating on the latest methods of blood and respiratory chemical determinations

2 In the Epstein modification of Lewis and Benedict s sugar blood test is it necessary to heat the picric blood sugar mixture over a free flame in the process of concentration just before and after the sodium carbonate is added? We have made the concentration over a steam bath and have not been able to detect any difference in the readings

3 Is it necessary to use a rubber bag in determining the alveolar carbon dioxid tension of alveolar air according to the method of Dr Marriott or can accurate results be obtained by having the patient exhale several times through a tube into the bicarbonate solution direct?

4 Is it possible to purchase the celloidin sacks used in the alkali reserve of blood plasma and the H ion concentration tests? Where may these be purchased?

Please omit name and address X Y Z

ANSWER—1

Medical War Manual No 6 Laboratory Methods of the U S Army Edition 2 Philadelphia Lea & Febiger $1 50
Rockwood E W A Laboratory Manual of Physiologic Chemistry Edition 4 Philadelphia F A Davis & Co $2 00

2 It is not necessary
3 A rubber bag should be used
4 Try the Central Scientific Company, 460 East Ohio Street, Chicago, Hynson, Westcott and Dunning, Baltimore, or any other good medical supply house

EXCEPTIONS FOR PHYSICIANS IN PARKING ORDINANCE

To the Editor —Our city has recently passed an ordinance prohibiting the parking of cars down town We are trying to get them to make an exception for physicians Will you let me know what cities do this? W H OWENS M D Atlanta Ga

ANSWER—So far as we know Billings, Mont, Easton, Pa, Greensboro, N C, and Fresno Calif have special exceptions for physicians in their parking ordinances

A GRADUATE COURSE IN ORTHOPEDIC SURGERY

A report states that the Harvard Medical School is planning to establish a graduate course in orthopedic surgery The course will be open, mainly, to graduates in medicine who have completed service as house officers in surgery in approved hospitals The course is planned to cover eighteen months, of which six months will be spent in the laboratories of the Harvard Medical School, six months in the Children's Hospital, and six months in the Massachusetts General Hospital The sequence will depend on the vacancies in the hospitals but as a rule the laboratory training will be in advance of the clinical work The laboratory portion of the course will be left sufficiently flexible to supply the varying needs of the applicants—a need greatly emphasized by experiences of a large number of medical officers in this special field during the war In order to pursue the clinical work to the best advantage it was decided that something should be done to correct any deficiencies of training in the fundamental branches At the same time, the instruction will be of an advanced character rather than elementary The candidates will be started at the hospital portion of their course at various times during the year, since hospital facilities necessitate the appointment of men periodically during the twelve months Since only a small number of students can be handled, they will be selected with great care The charge for the course will be kept at a nominal figure, and this will be only for the laboratory portion of the course It may be that fellowships can be provided for some, if not all, of the students who may be enrolled It is believed that the course as outlined will provide an opportunity for a number of special students to secure an excellent training in their chosen specialty

Educational Policy in China

What is reported as the largest medical conference ever assembled in the capital of China was held February 21-28, of the present year Over 300 delegates were present, including 210 medical missionaries A message from the minister of education of China was read which stated the following as the educational policy for the immediate future in that country

1 To establish new medical schools as soon as conditions will allow on the basis of one medical school for each province

2 To improve and extend such schools as were already established.

3 To encourage the study of medicine and to maintain for the scientifically trained doctors a high social status aiming at a sufficient number for this important profession

4 To cause to be organized at proper localities such institutions or facilities of investigation as will aid specialists in their research work, and

5 To regulate the practice of doctors trained in the traditional way with a view to the unification of standards required of medical practitioners

Delaware June Examination

Dr P S Downs, secretary, Delaware Regular State Board of Medical Examiners reports the written and practical examination held at Wilmington June 16-18, 1920 The examination covered 10 subjects and included 100 questions An average of 75 per cent was required to pass One graduate of Temple University, 1918 was examined and failed

Book Notices

THE PROBLEM OF THE NERVOUS CHILD By Elida Evans Introduction by C G Jung M D, LL D Cloth Price $2 50 Pp 299 New York Dodd Mead & Co 1920

Physicians realize that some of the disturbances of children, as many of the functional disturbances of adults have their origin in early experiences Perhaps, through the influence of Freud, this point of view has been exaggerated, on the other hand there is no doubt that an intimate analysis of the child's habits and its relations to its friends, relatives and its general environment frequently reveals the underlying factors that manifest themselves in systemic upheavals Among the most recent of several new books on the general subject is this work which has the distinction of an introduction by Jung The introduction is one of those graceful prefaces which merely state that the author seems to be well acquainted with the subject, and can therefore be granted reliance The book yields no evidence as to the experience or official position of the author, except that she herself was for some time a pupil of Jung Of all the books thus far available on the nervous child this one places most attention on the infantile sexuality and libido It is hardly a book of value for the general public because of the overemphasis of the sexual side, for the physician or educator who can use it with proper appraisal of the arguments and facts presented, it will make interesting if not altogether valuable reading

THE YOUNG PHYSICIAN By Francis Brett Young Cloth Price $2 50 net Pp 320 New York E P Dutton & Company, 1920

The author dedicates his book to Thomas Brett Young, M D, his father, from whom, undoubtedly he must have secured much of the medical material which it contains, for, like few other novels, everything medical in this book is accurate and real The book tells the life story of a young man from his first day in preparatory school to the first few years of his practice as a physician The first half of the book, which is especially interesting is a fascinating psychologic study of the development of boy character The middle portions of the book seem somewhat dull and halting, but the final portions, taking up entrance into the medical school with intimate scenes of dissecting room laboratory and clinic are thrilling with real life well described The book will be of interest to physicians as a literary exposition of what each of them has lived through An enthusiastic advertisement compares the style of Mr Young to that of Conrad, which is not complimenting Conrad

DISEASES OF THE CHEST AND THE PRINCIPLES OF PHYSICAL DIAGNOSIS By George William Norris A B M D Assistant Profes or of Medicine in the University of Pennsylvania and Henry R M Landis A B M D Assistant Professor of Medicine in the University of Pennsylvania With a Chapter on the Electrocardiograph in Heart Disea e by Edward B Krumbhaar Ph D M D Assistant Professor of Research Medicine in the University of Pennsylvania Second edition Cloth Price $8 net Pp 844 with 433 illustrations Philadelphia W B Saunders Company 1920

In this edition has been added a discussion of spirochetal bronchitis, influenza, streptococcus empyema, chronic inflammatory conditions of the lungs of uncertain etiology calcification of the lungs, pneumopericardium etc In other words, it is brought completely up to date This excellent work was given full and favorable review in THE JOURNAL, Dec 29, 1917 and what was then said in endorsement of the book would be repeated here, if necessary

A DIABETIC MANUAL FOR THE MUTUAL USE OF DOCTOR AND PATIENT By Elliott P Joslin M D Assistant Professor of Medicine Harvard Medical School Second edition Cloth Price $1 75 Pp 191 with illustrations Philadelphia Lea & Febiger 1919

The second edition of this book has been thoroughly revised, condensed and simplified It is a safe book to place in the hands of diabetic patients Physicians will believe with Dr Joslin that, for one diabetic patient who learns too much about the disease, there are unquestionably ninety-nine who know too little, and that those patients who are most intelligent and who understand their disease best live longest

LA TENSION ARTÉRIELLE EN CLINIQUE SA MESURE SA VALEUR SÉMÉIOLOGIQUE Par le Dr L Gallavardin Medecin des Hopitaux de Lyon Second edition Paper Price 30 francs net Pp 717 Paris Masson & Cie 1920

This edition, published ten years after the first is in reality a new book The author has brought the subject up to date and has included the results of his own clinical experience The work contains a full discussion of the principles underlying arterial tension and the various methods of estimating it The last two thirds of the book treats of the clinical features of the condition with an adequate consideration of therapy The book is a reliable and complete exposition of this important subject

A MANUAL ON FOOT CARE AND SHOE FITTING FOR OFFICERS OF THE U S NAVY AND U S MARINE CORPS By W L Mann Ph B A M M D Lieutenant Commander (M C) U S Navy and S A Folsom M D Lieutenant (M C) U S Navy Cloth Price $1 75 net Pp 124 with 58 illustrations Philadelphia P Blakiston's Son & Co 1920

This is one of the handy manuals for the definite purpose mentioned in the title Its directness and brevity appeal both to the busy practitioner and to the specialist

Competent Medical Witness and Evidence of Insanity

(*Beasley v Faust (Texas) 217 S W R 179*)

The Court of Civil Appeals of Texas says that in this action on a note and mortgage executed by the defendant for whom the defense of insanity was made a physician testified that he thought the defendant had been insane all the time from the fall of the Wilson campaign to the time of the trial This testimony was objected to on the ground that the witness did not qualify as an expert and because he was testifying to his opinion concerning the mental condition of the defendant at a time when he had not observed him The physician had practiced medicine for fifty-five years and had ample opportunity to observe the defendant during the years concerning which he testified but was unable to state that he had observed him at the time of the execution of the note and mortgage He had not specialized in the treatment of mental diseases but had treated a good many persons who were insane He had read textbooks on insanity, and his opinion whether insanity was curable was based on observation and textbooks He modestly admitted that he did not know what kind of insanity the defendant had and this admission was considered by the plaintiff to be sufficient to deprive him of standing as a skilled witness As the court understands the authorities the physician fully qualified as a skilled witness who was entitled to give his opinion of the mental condition of the defendant not only at such times as he observed him but also at the time he executed the instrument in question his opportunities for observing and conversing with the defendant before and after such times being such as to justify him in forming the opinion expressed The specialist in diseases of the mind may be able to classify with reasonable accuracy all cases of insanity which come under his observation but it is not necessary that the physician should be a specialist in order to testify as a skilled witness

Nor was there error in permitting the physician to testify that the defendant from about 1912 to the date of the trial would not be conscious of the effect his acts would have on him or surrounding circumstances The objection was urged that this testimony was a legal conclusion of the witness but the testimony was not subject to that objection No knowledge of any rule of law was necessary in order to answer the question The answer involved only an opinion concerning the extent or degree of the mental unsoundness of the defendant The expression of an opinion that a person did not have sufficient capacity to make a will or deed or to transact business has been held improper by the courts of Texas and these holdings are in accordance with the right

of authority To make a valid will or contract, a certain amount of mental capacity is required by the rule of law to be applied testing the validity of the transaction, and for a witness to say that a person has the requisite capacity implies that such witness knows the rule of law and is applying it in arriving at his conclusion But it seems obvious that to state that a person would not be conscious of the effect his act would have on him does not imply that the witness has attempted to apply a legal definition to test the validity of any act of the person

It might have been contended that the opinion expressed by the physician was in effect an opinion that on the date of the execution of the note and mortgage the defendant was not conscious of the effect his acts would have on him, and that therefore necessarily he expressed the opinion that the defendant was not conscious of the effect the execution of the note and mortgage would have on him Looking at the matter from that standpoint, the objection might have been urged that the opinion was one on the ultimate fact to be determined by the jury However, that objection is not tenable if the opinion relates to a matter within the scope of expert testimony In this case, moreover, the only objection relating to the competency of the evidence was that the opinion involved a legal conclusion Such objection was properly overruled

Construction of Statute Making Hospital Records Admissible in Evidence

(Leonard v Boston Elevated Ry Co (Mass) 125 N E R 593)

The Supreme Judicial Court of Massachusetts, in overruling an exception to permitting to be read to the jury that portion of the records of a hospital to which the plaintiff was taken after he was injured which contained the statement, "odor of alcohol on breath," says that this required the construction of the Massachusetts statute which requires certain hospitals to keep records of the treatment of the cases under their care and their medical history and provides that such records shall be admissible as evidence in the courts of the commonwealth so far as such records relate to the treatment and medical history of such cases, but nothing therein contained shall be admissible as evidence which has reference to the question of liability In construing this statute the court cannot accept the view of the plaintiff that the hospital record is inadmissible if it may have "reference to the question of liability," even though it directly relates only to the treatment and medical history of the case" A reasonable interpretation must be given to both these clauses in the statute Apparently the legislation making this hearsay evidence admissible was enacted primarily to relieve physicians and nurses of public hospitals from the hardship and inconvenience of attending court as witnesses to facts which ordinarily would be found recorded in the hospital books Under this statute only such portions of the record are admissible in evidence as relate to the treatment and medical history of the patient The difficulty in applying the act arises from the nature of the entries made in hospital records It frequently must happen that facts stated therein which deal in the main with the patients' medical history, may also be relevant to the issue of liability, in the event of litigation For instance, a statement of the location and nature of the patient s injuries, primarily an essential element in the history and treatment of his case, may incidentally tend to confirm or disprove his claim as to how the accident happened So the condition of intoxication, in the case of a patient suffering from delirium tremens, would be an important element of his medical history and treatment, at the same time it well might bear on the issue of liability in an action to recover under the civil damage law In the court's opinion, a reasonable and practical construction of the statute requires that a record which relates directly and mainly to the treatment and medical history of the patient should be admitted, even though incidentally the facts recorded may have some bearing on the question of liability The improper application of the facts recorded can be prevented by means of suitable instructions to the jury The court is unable to say as a matter of law that in the present case the "odor of alcohol on the breath" could not relate to the plaintiff s medical history So far as appeared, the usual physical examination may have been a material fact to consider in making a diagnosis of his condition

Right of Physician to Sue Employer Not Taken Away

(Noer v G W Jones Lumber Co (Wis) 175 N W R 784)

The Supreme Court of Wisconsin affirms a judgment in favor of the plaintiff, a physician, for services rendered in treating, and furnishing hospital accommodations to, an employee of the company injured under circumstances making the defendant liable for compensation under the workmen's compensation act, and notwithstanding that it was contended that the court had no jurisdiction of the case The supreme court says that, when the plaintiff presented his bill, payment was refused on the ground that it was excessive, and a request was made that the matter be referred to the industrial commission for adjustment, which was refused by the plaintiff It was argued for the defendant that, the services having been rendered to an injured employee at the request of the employer, no liability existing on the part of the employer to furnish such services except by virtue of the workingmen s compensation act all of which was known to the plaintiff, exclusive jurisdiction was vested in the industrial commission to pass on the reasonableness of the charges made for such services and that the plaintiff could not maintain an action at law to recover therefor This contention was unsound

The workmen s compensation act deals exclusively with matters growing out of the relation of employer and employee The provisions of the act are binding on employers and employees electing to be bound by them and on none others All except employers and employees are strangers to the act and their usual lawful rights and remedies are unaffected by it True, it is made the duty of the employer to provide certain medical attention to its employees, but the act does not provide that he who renders such medical services at the request of the employer must submit the reasonableness of his charges in that behalf to the industrial commission for its approval and allowance The physican rendering such services is no more deprived of his right to resort to the courts for the establishment and collection of his claim than though the services had been rendered to the employer personally The fact that neither employer nor employee, those for whom the act was primarily designed is affected by its provisions against their consent, coupled with the further consideration that no method is provided by which a physician may consent to be bound by the terms of the act would strongly negative the inference that the act was intended to have the effect for which the defendant contended

The provision in the act that the industrial commission shall have jurisdiction to pass on the reasonableness of medical and hospital bills in all cases of dispute in which compensation is paid, in the same manner and to the same effect as it passes on compensation, confers on the industrial commission authority to pass on and determine the amount which the employer shall pay the employee when the employer has failed in his duty to provide proper medical attention, which was provided by the employee himself Under such circumstances the reasonable value of the services, as determined by the industrial commission, measures the amount which the employer must pay to the employee for this item of compensation but the physician rendering the services is in no manner bound by such determination when he proceeds to collect from the employee His remedy in the courts is left unimpaired, and he may maintain his action therein for the value of his services as he conceives them to be

Having discovered no legislative justification in the workmen's compensation act to deprive physicians, rendering services under the circumstances here presented, of their legal rights and remedies, the court finds it unnecessary to consider the question of the power of the legislature to confer on the industrial commission the exclusive jurisdication for which the defendant contended

Seventy Fourth Annual Meeting held at Toledo Ohio June 1 3 1920

The President, DR J F BALDWIN, Columbus, in the Chair

Therapeutic Possibilities of Blood Transfusion Methods, Indications and Results

DR E R ARN, Dayton Hard and fast rules cannot be drawn about the possibilities of blood transfusion The physician must be guided by the single purpose of doing the most good at the minimum risk Many lives are lost either by not transfusing at all or by doing it too late The illness of many patients could be shortened materially by blood transfusion, operations could be made less hazardous, and recovery could be hastened and made less burdensome When bleeding has been abrupt and excessive, a blood transfusion is indicated because it alone can raise and sustain the blood pressure It is a good working rule to transfuse if the blood pressure falls as low as 70 mm of mercury, since life is hardly possible with a pressure below that limit The citrate technic is the method of choice In cases of hemorrhage of the new-born, transfusion is a specific In cases of pernicious anemia, it yields results superior to any other mode of therapy and frequently acts as a life-saving measure by initiating the onset of a remission Most of the dangers of transfusions can be prevented by avoiding the use of incompatible blood, excessively large injections, and emboli of air or blood clot

Medical Aspects of Blood Transfusion

DR LOUIS A LEVISON, Toledo The conditions in which aid of a lasting nature may reasonably be expected from blood transfusion are disappomtingly small In fact, it may be said that blood transfusion does not cure any disease The only exception to this would probably be certain hemorrhagic states in early infancy However, blood transfusion is life saving in many conditions in which hemorrhage is present as a symptom Occasional deaths ensue even after all the requirement of grouping have been met Only the most extreme emergency warrants a blood transfusion without determining the compatibility of the donor and the recipient In view of the reactions of successive transfusions involving the same participants, a separate determination of type should be made prior to each injection The benefit derived is probably due to the rise in hemoglobin percentage and not to the mass bulk of the blood itself Sooner or later blood transfusions cease to bring about remissions in anemias, but before this time there are usually pronounced cord signs to indicate the hopeless nature of the disease A field yet to be explored is the use of transfusion employing immunized blood in serious, chronic infections, especially those associated with endocarditis

Craniocerebral Injuries

DR THERON S JACKSON, Cleveland Cranial injuries are almost always emergencies, and those who handle them must be ready to make a rapid, systematic examination, accurate enough to enable them to use the correct treatment for the individual case Cushing's classification of craniocerebral injuries is as applicable to civil practice as to the surgery of war One of the chief difficulties encountered is the evaluation of cases of concussion Skull fractures and cerebral hemorrhage are so frequently masked by concussion that they must always be suspected In the differential diagnosis I have learned to rely on a rising pulse pressure associated with a falling pulse rate as a definite indication for operation Delay until symptoms of medullary compression arise spells disaster Valuable diagnostic information may also be obtained from the incidence of papilledema and the results of lumbar puncture, reflex reactions and stereoscopic roentgenograms Apparently mild injuries may eventuate in profound cerebral complications, while seemingly much more severe external injuries may recover without surgical interference We should always be prepared to perform a craniotomy at the earliest moment that a diagnosis of cortical irritation or compression is justified According to the best available statistics the end-results following operation whenever there has been a reasonable suspicion of intracranial injury have been much better than those following palliative treatment

The Laryngologist and Diseases of the Lungs

DR JOHN A THOMPSON Cincinnati The direct, local treatment of inflammatory diseases of the lungs gives results that cannot be obtained in any other way The training and skill of laryngologists fits them especially to give this treatment The diseases of the lungs in which local treatment is useful are acute and chronic inflammation of the trachea and bronchi, bronchiectasis, bronchial asthma, pulmonary tuberculosis pulmonary syphilis and emphysema The recovery from pneumonia, either bronchial or lobar, can be aided greatly by local treatment For an ordinary injection I prefer the following mixture atropin, 1 grain, epinephrin, 2 grains, menthol 48 grains, camphor, 80 grains, oil of sweet almonds, 4 ounces and liquid petrolatum, 12 ounces Using 1 or 2 drams for an injection will give a dosage of atropin 1/4 grain, epinephrin, 1/32 grain, menthol, 1 grain, and camphor about 1 1/4 grains Curing bronchitis by direct medication also cures bronchial asthma if treatment has been begun before the lungs become emphysematous or the heart has been weakened beyond repair In pulmonary tuberculosis, no direct curative effect on the disease can be expected from local medication but the complicating laryngitis and bronchitis can be helped and the paroxysms of coughing decreased by half A healthy mucosa will not be infected by the tuberculous sputum and the fatal laryngeal tuberculosis can be prevented by regular injections Also the control of the cough makes it unnecessary to give narcotics, and the nutrition of the patient is not impaired by medication

Surgical Phases of Cancer Problem

DR FRANK WARNER Columbus Cancer is the most fatal disease of adult life Of those who reach the age of 40 years, one person in eleven dies of cancer Cancer is neither hereditary contagious nor transmissible At the outset it is a purely local condition easily cured by radical operation A large number of the cases reach the surgeon only when terminal symptoms of the disease are present The public should be thoroughly informed regarding the necessity for early diagnosis and prompt operation The knife should always be used in early cases of cancer Care should be exercised not to spread cancer cells onto raw surfaces during operation as they grow readily Heat, the roentgen ray and radium should be reserved for handling inoperable cases

Treatment of Hyperthyroidism with Corpus Luteum

DR H H HOPPE Cincinnati I have been using corpus luteum in the treatment of hyperthyroidism for six years One of the patients has died of influenza, all the others are doing well and some of them seem to have reestablished a normal balance of the endocrine glands and no longer take corpus luteum while others are comfortable only when they take the remedy The most notable and rapid improvement following the use of corpus luteum is seen on the part of the cardiovascular symptoms and general nervous manifestations While I regard corpus luteum as a specific in exophthalmic goiter I have not discontinued symptomatic treatment or the attention to hygiene and diet I usually give corpus luteum 2 grains, quinin hydrobromate, 3 grains, and extract of belladonna 1/10 grain after each meal On improvement the dosage is reduced to two capsules a day and then to one dose at bedtime. The theory on which this treatment is based is that hyperthyroidism is caused by a defective secretion of the interstitial sex glands and the

have an inhibitory and regulatory action on the secretion of the thyroid, and that when their function is deficient there is a lack of physiologic inhibition of the thyroid with an excessive secretion, and, therefore, hyperthyroidism In other words, hyperthyroidism and hypo-ovarianism are synonomous conditions

(To be continued)

AMERICAN PEDIATRIC SOCIETY

Thirty Second Annual Meeting Held in Highland Park Ill May 31 June 2 1920

(Concluded from page 129)

Dyspituitarism So-Called Absorption of Membranous Bones, Exophthalmos and Polyuria

DR ALFRED HAND, Philadelphia A boy, aged 4 years, had a tumorlike swelling of the left parietal region removed at the age of 2 There was absence of bone under the tumor down to the dura, Section revealed a slight degree of inflammation, but mainly a myxomatous change Since then other swellings had appeared, and exophthalmos, which was greater on the right, but as yet there had been no polyuria

Use of Fresh Vaccines in Whooping Cough

DR ROWLAND G FREEMAN, New York In sixteen children, pertussis vaccines were used at various periods of the disease In five, no results were obtained, three received the vaccines early in the disease, and two very late Of the remaining eleven cases, nine showed a very material improvement and in four a practical cure was obtained Quite remarkable results obtained in certain beginning cases have convinced me that these vaccines should have an extended use, particularly in institutions where controls might be used to demonstrate whether we might not have in these vaccines a valuable method of reducing the large mortality from whooping cough Dr Huenekens' antibodies were not present after the injection of whooping cough vaccines unless the vaccines were freshly prepared

Rickets

DRS JOHN HOWLAND and EDWARDS A PARK, Baltimore A definite correlation exists between the roentgen-ray signs and the actual pathologic conditions Calcium deposits in the cartilage cast well-defined shadows The effectiveness of cod liver oil as a therapeutic agent in rickets is demonstrated In animal experiments a beginning calcium deposit can be demonstrated two days after beginning the administration of cod liver oil In human beings the calcium deposit in the cartilage is definitely demonstrable at the end of three weeks after beginning the administration of cod liver oil

DISCUSSION

DR. W MCKIM MARRIOTT, St Louis In order to gain some knowledge of the nature of the process which causes a deposition of lime salts, we have made a solution containing all the inorganic constituents of blood plasma, an "artificial blood," containing phosphates, lime, magnesium salts, sodium bicarbonate and carbon dioxid, the latter being at a tension of 40 mm Such a solution is perfectly clear, but a precipitate occurred when a portion of the carbon dioxid was removed or if more bicarbonate, calcium salts or inorganic phosphate were added The precipitates obtained in these various ways had each different compositions The only precipitate that had a composition the same as that of bone was obtained by increasing the amount of phosphate in solution A very small increase in the amount of phosphate in solution caused a considerable precipitate of the substance having the approximate composition of bone It would seem likely, therefore, that the method by which bone is laid down in the body is by an increase in the amount of phosphate present at some point, and that a mere increase in alkalinity is insufficient Such being the case, it would be interesting to know whether or not the phosphate content of the blood is increased following the administration of cod liver oil

DR. H J GERSTENBERGER, Cleveland We have fed 1 200 or more babies on a synthetic milk, containing 10 per cent fat in the form of cod liver oil, and we have as yet to see the first case of spasmophilia or rickets among the children so fed

DR CLIFFORD G GRULEE, Chicago Dr Phemister showed that feeding of phosphorus to normal children has produced a thickening of the ends of the bones very much the same as that produced by cod liver oil A longer feeding of phosphorus caused a greater thickening at the epiphyseal line In these children the phosphorus was used alone and not in combination with cod liver oil

DR JOHN HOWLAND, Baltimore After feeding cod liver oil we found the phosphorus content of the blood greatly increased

Sarcoma of Kidney

DR ROWLAND G FREEMAN, New York A child aged 2½ years, weighing 26½ pounds, had been in failing health for two months A tumor of the kidney on the left side was diagnosed Six weeks after operation the child was very dyspneic, with rales over the entire chest Roentgen-ray examination revealed numerous metastases in the lungs

Case of Portal Thrombosis

DR RICHARD M SMITH, Boston A child aged 3 years, gave a history of acute rise of temperature and cough lasting seven days before admission Several ecchymotic spots were present on the body, together with an enlarged heart, with a systolic murmur heard all over the precordia, an enlarged spleen, low red blood cell count and low hemoglobin The abdomen gradually distended with fluid, the superficial veins in the upper portion became enlarged, and the spleen increased greatly and assumed a transverse position in the abdomen The pulse remained rapid, respiration from 30 to 35 Six weeks after admission the child vomited a large amount of bright red blood The child was transfused several times, but died virtually two months from the onset of the illness No diagnosis was made during life. At necropsy, thrombosis of the portal vein and its great radicles was found, with passive congestion of the spleen, ascites, hypertrophy and dilatation of the heart, edema of the lungs and anemia Undoubtedly the thrombosis was of infectious origin arising in connection with the initial infection of the respiratory tract

Case of Paralysis of the Respiratory Muscles

DR W MCKIM MARRIOTT, St Louis A girl, aged 10 years, six weeks after an attack of diphtheria developed paralysis of the palate, ocular muscles, legs, back and neck muscles and partial paralysis of the arms, and ultimately the diaphragm became involved so that it failed to move at all during inspiration Artificial respiration was given by means of the Erlanger-Gessel air current interrupter connected with a nitrous oxid mask After ten minutes of artificial respiration the child fell asleep and the mask was removed Cyanosis slowly developed and was again relieved by artificial respiration This was kept up more or less continuously for five days, at the end of which time the function of the respiratory muscles began to return and the child was able to breathe without the apparatus She made a complete recovery

Congenital Atresia of Esophagus

DR HENRY L K SHAW Albany In this case necropsy revealed that the upper third of the esophagus ended in a culdesac and had no relation to the lower part, which opened into the trachea

A Case of Lymphosarcoma

DR CHARLES A FIFE, Philadelphia A boy, aged 9 years, gave a negative history until his seventh year, when a slowly enlarging right cervical node was detected On the supposition that the node was tuberculous, the roentgen ray was used Within five months of the cessation of roentgenism, extensive metastases in the tracheobronchial lymph nodes produced massive exudation into the left pleura, but causing no other signs of mediastinal compression There was a tremendous enlargement of the spleen and liver The lymph nodes in the abdomen which were not affected by radiation were full of typical, active tumor cells, while those in the region treated by the roentgen-ray and radium showed retro-

grade changes in the tumor cells, many of which were replaced by dense connective tissue

Primary Sarcoma of Thymus

DR. L. EMMETT HOLT, New York A child, aged 6 months, gave symptoms dating back only four weeks, consisting merely in increased pallor and slight fever There were a few minute hemorrhages over the neck and extremities The case was regarded as one of severe secondary anemia At necropsy a sarcomatous thymus weighing 36 gm was found Besides the sarcomatous change in the thymus, similar lesions were found in a lymph node in the spleen and in the lungs The child presented none of the symptoms associated with enlarged thymus

Case of Anaphylaxis Following an Intradermal Protein Sensitization

DR HENRY J GERSTENBERGER, Cleveland A boy, aged 17 months, who had never received egg in any form developed an extreme anaphylactic shock after an intracutaneous administration of egg yolk allergen and egg albumin in doses of 1 and 2 mg This child who had received cow's milk from the third week of life and had suffered from eczema and asthma, showed a negative intracutaneous test to cow's milk casein and cow's milk albumin The intracutaneous injection of cow's milk allergen responded within twenty-four hours with an indurated and red area of infiltration not unlike that of an ordinary positive von Pirquet test, but entirely different from an urticarial wheal

Blood Findings in a Child Five Years After Splenectomy

DR HOWARD CHILDS CARPENTER, Philadelphia The average results of thirteen blood counts in a white boy, aged 10 years, who had had his spleen removed five years before for familial hemolytic icterus of the Chauffard-Minowski type, show that the red blood cells, which before the operation were down to 2,020 000, have increased to 4 288 000 the hemoglobin, which was as low as 23 per cent before the operation, now is 82 per cent There is still present evidence of bone marrow regeneration as shown by the high color index, the continued leukocytosis, moderate chromophilia and poikilocytosis, high transitional and eosinophil counts, and reticulation of the erythrocytes There is an unusually quick coagulation time and a rather low platelet count indicating in this case either a rapid availability of the platelets for the purposes of coagulation or an increased amount of prothrombin in the platelets, or a large percentage of macroplatelets No Howell-Jolly bodies were found There is also evidence of lymphatic activity shown by absolute lymphocytosis, and by the enlargement of the external lymph glands and the very large tonsils

Duct Sign in Mumps

DR. DAVID MURRAY COWIE, Ann Arbor, Mich In 97 per cent of fifty-seven cases of parotid mumps, a red spot was observed at the orifice of Steno's duct, which developed and disappeared under the influence of the disease The duct itself becomes teatulated The sign develops early in the disease sometimes ahead of the swelling of the parotid and disappears when the duct returns to normal It is influenced by the degree of fever

Misuse of Milk in the Diets of Infants and Young Children

DR B RAYMOND HOOBLER Detroit There is much propaganda by popular writers urging the increased use of milk as a food for the young I believe that this is being overdone and that many mothers are forcing milk in such large quantities on their children that it becomes a positive menace to health, particularly in the group of children between the ages of 1 and 6 years In taking a diet so largely composed of milk, the child is robbed of minerals that should come to it in fresh fruits, vegetables and cereals not to mention the vitamin and antiscorbutic properties which these foods possess

DISCUSSION

DR CHARLES GILMORE KERLEY, New York After a child is 15 months old I give milk only to the amount of 1 pint daily The child fed entirely on milk is likely to be flabby, and in the second, third and fourth year it is likely to have secondary anemia

DR THOMAS S SOUTHWORTH, New York In the agitation for the larger use of milk, the fact that the kind of milk is important has been forgotten, it should be milk free from pathogenic bacteria

DR. E W SAUNDERS St Louis I agree with Dr Hoobler in every respect I never give Jersey cow's milk unless it is well skimmed I can see no valid reason why milk should be raised above a temperature of 140 F., which is sufficient to kill all pathogenic micro-organisms

DR MAYNARD LADD, Boston In feeding milk to children 2, 3 or 4 years of age, we should take into consideration the amount of butter the child is getting The harmful effect of milk is often due to the excessive amounts of butter fed on the theory that the more butter the child eats the better If one feeds a child a quart of milk a day he should be very careful to see that he is not receiving too much butter

Has Malt Soup Extract an Antiscorbutic Value?

DR. HENRY J GERSTENBERGER, Cleveland While studying the respiratory quotient of scorbutic infants it was decided for definite reasons to feed these children on Keller's malt soup extract, a mixture which has made for itself a reputation of producing and never of curing scurvy During this study three infants recovered unexpectedly in a rapid and complete manner This may be accounted for on the theory that this special lot of malt soup extract possessed an antiscorbutic content due to some unwonted occurrence during its manufacture

DISCUSSION

DR. JOSEPH BRENNEMANN Chicago It is difficult to explain why some foods cure scurvy and others do not and why some children are cured by almost any change in diet It would seem that individual susceptibility is a large factor in connection with both the causation and the cure of scurvy

DR J P CROZER GRIFFITH Philadelphia It is beyond question that there must be besides diet, a peculiar disposition to develop scurvy seen in a comparatively small number of infants, otherwise we would find all the infants fed on a certain mixture of proprietary food developing scurvy Malt soup has been a favorite food with me for many years and I have not seen more than two or three children develop scurvy in spite of the fact that no orange juice was administered It is again evident in these cases that there is some element other than diet concerned, and that malt soup is not to be blamed more than other foods

DR CHARLES G KERLEY, New York I have seen more cases of scurvy develop on malt soup than with any other method of feeding

DR THOMAS S SOUTHWORTH, New York This subject should be very thoroughly discussed before the impression is conveyed that malt soup extract is an antiscorbutic In one institution in which this preparation was used for some years because we obtained better results with it than with lactic acid milk we had repeated outbreaks of scurvy when the management of the institution failed to provide sufficient orange juice or tomato It is absolutely essential that infants receiving malt soup should have orange juice or tomato in considerable quantities

Fate of Subcutaneously Injected Red Blood Cells

DR ROOD TAYLOR Minneapolis Using Ashby's method of differential red blood cell counting I determined that following subcutaneous injection of homologous citrated blood there is no marked absorption of injected corpuscles into the recipient's circulating blood

Calcium-Magnesium-Phosphorus Balance in Children Subject to Convulsive Disorders

DR B RAYMOND HOOBLER Detroit In general it was found that the retention of these minerals was considerably diminished in children subject to convulsive disorders when compared with normal controls The findings indicate that in such children an attempt should be made to discover the mineral deficiency and if such a defi- found in effort should be made to bring it up

Current Medical Literature

AMERICAN

Titles marked with an asterisk ( ) are abstracted below

American Journal of Diseases of Children, Chicago

June 1920, 19, No 6

*Effect of Intravenous Injections of Calcium in Tetany and Influence of Cod Liver Oil and Phosphorus in Retention of Calcium in Blood A Brown I F MacLachlan and R Simpson Toronto

Von Pirquet's Feeding System H K Faber San Francisco —p 478

Calcium Lactate in Tetany—Constitutional reactions were produced following intravenous injection of calcium lactate in 1.25 gm doses in nine patients observed by Byfield and his associates The degree of reaction varied from a slight drowsiness to almost complete collapse accompanied by dyspnea The signs of reaction disappeared usually between one and seven hours, the more severe the reaction the longer it took the patient to recover A temporary absence of both electrical and mechanical signs of tetany usually lasting from seven to ten hours was noted Apparently no beneficial therapeutic effect was exerted, unless this was supplemented by the administration of cod liver oil and phosphorus, and in this instance the reduction of the tetanoid symptoms is a little more rapid than with the employment of cod liver oil and phosphorus alone Cod liver oil and phosphorus produced an increase in the blood calcium with a corresponding reduction in the mechanical and electrical signs, within a period of from ten to seventeen days

Allergy—Twelve patients who were desensitized for from three to seven years were followed by Schloss All of these patients are now quite immune and can eat, without discomfort, the foods to which they were sensitive The results of this study are described in detail

Fordyce's Disease—This is one of the conditions of the mouth which may simulate Koplik's spots when they exist in patients who develop German measles The similarity between the clinical symptoms of the two diseases is further increased by the presence of these pseudo-Koplik spots Fordyce's disease is quite frequently mistaken for early Koplik spots in patients ill with various contagious diseases and exposed to measles, whose buccal mucosa is being examined daily for the appearance of the true spots The possibility of these pseudo-Koplik spots leading to errors in diagnosis when they are present in patients with suspicious looking maculopapular eruptions from serum or antitoxin, should be borne in mind

Incidence of Bacillus of Pfeiffer—Among 1,000 patients examined by Wollstein and Spence for the presence of the bacillus of Pfeiffer in the sputum the organism was found in 474 The bacillus of Pfeiffer was present in the sputum of 74 per cent of all the pneumonia cases studied Eighty-five per cent of all the cases with rhinitis and bronchitis severe enough to produce systemic reactions were positive for that organism Fifty-three per cent of the ordinary colds showed the bacillus, but only 11 per cent controls carried it It would seem, then, that this bacillus is not a normal inhabitant of the normal respiratory tract, but that at the time when an epidemic of influenza prevails, it is present in over 50 per cent of all cases of inflammations of any portion of the respiratory tract

*Two Unusual Phases of Hepatic Syphilis U J Wile Ann Arbor —p 656
Physics of Roentgen Ray J S Shearer Ithaca N Y —p 664

Precancerous Lesions of Vulva—An accurate study of the vulva in 100 women beyond the menopause was made by Taussig The average age of these women was 67 years All variations of vulvar atrophy were encountered They were independent either of age, or the amount of atrophy in other parts of the skin or of the amount of vaginal discharge. The extreme forms of atrophy were more common in those women who had had children Cases of extreme atrophy presented at times a markedly dry and brittle skin that cracked open on merely separating the labia for inspection In spite of frequent lack of cleanliness, pruritis was only rarely present The special pathologic conditions encountered were pruritis vulvae, kraurosis vulvae, leukoplakic vulvitis and carcinoma vulvae It was apparent that the cessation of ovarian secretion, either by castration or at the menopause, leads to profound atrophic changes in the vulvar skin which, under special conditions, predispose to carcinoma In all instances there is a general atrophy which varies greatly in the typical cancer following leukoplakic vulvitis There is a combination of three factors cessation of ovarian function, disappearance of elastic tissue from the underlying dermis, and chronic inflammation These are with reasonable certainty of special significance in the etiology of the malignant degeneration

Hydrargyrism.—In Bechet's case only 1 dram of ointment of ammoniated mercury was contained in 1 ounce of salve, or approximately 1.25 per cent ammoniated mercury, and yet mercurial ptyalism resulted

Spirochetes in Red Blood Corpuscles—The spirochete-like bodies derived from red blood corpuscles by Eberson bear no relationship whatever to the organism of syphilis and may be produced at will

Etiology of Eczema—As clinical entities now well established the following are suggested by Hazen dermatitis due to external irritation, vagotonic dermatitis, urticarial dermatitis and dermatitis due to disturbed food assimilation (the eczema of young children) None of these conditions should, he says, be classified as eczema, as this only results in confusion and a failure to discover the cause

Syphilis of Liver—The two phases of liver syphilis described by Wile are "icterus gravis syphiliticus" also known as 'icterus syphiliticus praecox' and syphilitic cirrhosis

Sodium Carbonate in Chloroform Poisoning—Graham's study shows that dogs may be protected to a variable extent from the effects of late chloroform poisoning by the administration of sodium carbonate

Multiple Cartilaginous Exostosis.—A detailed analysis and classification of sixty-six reported cases made by Honeij showed that a positive history of heredity was obtained in thirteen of thirty-three cases, the disease having occurred in some members of the patients' families In one case, eight members were affected, and in several other cases many members were similarly affected Honeij reports four cases in detail with the study of the calcium and magnesium of two of the patients

Syphilis—The results of a study of the chemical analyses of the blood and urine and the effect of exercise and diet in the treatment of syphilis are given by Bailey and MacKay

Hereditary Diabetes—One of the patients in the diabetic service, with which Allen and Mitchell were connected, came of a family in which seven out of fourteen children of one father (one by one woman, thirteen by another woman) were diabetic In addition to the treatment, clinical and pathologic studies were carried out in the attempt to throw light on the hereditary feature of the condition Clinical examinations of the patient and his family for general or focal infections, including clinical and serological examinations for syphilis, were negative Glucose tolerance tests afforded an early diagnosis in one of the seven cases of diabetes, but were negative in the mother and the remaining children The gross and microscopic pathologic findings of the tissues of the patient who died served further to exclude syphilis, and were characteristic of tuberculosis The pancreas showed changes of two types, namely, occasional hydropic degeneration of islands (functional overstrain) and slight fibrosis and hyalin formation in islands (infectious or toxic damage) In general, the diabetic heredity, which apparently came through the father, was manifest in the children who most resembled him in coloring of complexion, eyes and hair, but the rule was not absolute As far as glucose tolerance tests could decide, the diabetic tendency was inherited as a unit character

Prevention of Goiter—Observations on the prevention of simple goiter in man on a large scale, made by Marine and Kimball, have extended over a period of thirty months The results show that it may be prevented very simply and cheaply in normal individuals While thyroid enlargements of adolescence are more common, they are not more important than those occurring in mother and fetus Prevention of adolescent goiter is properly a public health problem, while the prevention of fetal and maternal thyroid enlargements is largely a responsibility of individual physicians

Blood and Urine Analyses in Acute Yellow Atrophy—Stadie and Van Slyke report chemical analyses of the blood and urine made in a case of acute yellow atrophy for three days before death, together with analysis of the liver removed at necropsy three hours after death The study was directed especially toward the nitrogen metabolism and the acid-base balance of the patient An increased excretion of ammonia and titratable acids was observed in the last days of illness, and a fall of plasma bicarbonate to slightly below normal on the day before death Even at this time, however, the deviations from the normal were too small to indicate that acid intoxication was a significant factor in the condition The results afford confirmation of a quantitative character for the belief that amino acids are formed by autolysis in the atrophying liver, and circulate and are excreted as such in unusual amounts The excretion of amino acids did not appear to be due to increase in their rate of formation for the total protein katabolism was not abnormally or even unusually rapid The excretion appeared due rather to loss of power to deaminize amino-acids at even an ordinary rate These observations support the view that in the deamination of amino-acids and the synthesis of urea the liver bears a part which cannot be entirely assumed by the rest of the body

Influenza—McLaughlin presents an historical review of influenza and analyzes recorded data as to its epidemiology and etiology problems which remain unsolved He is convinced that more intensive comprehensive and sustained laboratory research must be made using the body fluids and secretions of influenza cases for material to solve the problem and secure the biologic aids now lacking for the prophylaxis and treatment of influenza

Pneumonia Lowers High Blood Pressure—A woman aged 54 had an habitual high systolic blood pressure never less than 225 and at times as high as 275 She contracted pneumonia On the third day of the pneumonia the blood pressure fell to 160 and continued to fall until it reached as low as 130 when lysis began and the dullness reached its height From this date with the gradual fall of the temperature of the pulse and of the respiration the blood pressure began to climb again the diastolic slowly the systolic quite rapidly, until after three weeks it reached 230 almost her habitual pressure Konikow interprets this case to mean that high blood pressures should be left alone if the cause of it cannot be ascertained and removed High blood pressure in itself is merely nature's means of self-defense

*XI Therapeutic Effects of Monovalent Antistreptococcus Serum in Influenza and Influenzal Pneumonia

Influenza and Pneumonia Studies Bacteriology—From a bacteriologic study made by Rosenow of a large series of cases of influenza and influenzal pneumonia throughout four epidemic waves, green-producing streptococci (including pneumococci) were found to occur more constantly and in larger numbers than any other organisms commonly associated with this disease This flora predominated alike in the cases of influenza without lung involvement, in those of lung involvement in the initial febrile attack as well as in those in which influenzal pneumonia developed after a quiescent interval following influenza During the latter part of the outbreaks hemolytic streptococci became relatively more numerous especially late in the disease and death was often the result of invasion by these organisms The influenza bacillus was found in the sputum in the early part of the first wave only in a few cases and always in association with streptococci, while throughout the remaining three waves it was isolated only occasionally

Leukopenia in Influenzal Pneumonia—Leukopenia, or absence of leukocytosis has come to be regarded as an important aid in the diagnosis of influenza, and a persistent leukopenia as of bad prognostic import The cause of the leukopenia has been the subject of much speculation Rosenow's findings indicate that the reduction in leukocytes following injection of the material from patients with influenza may not be due to an unknown virus, but to peculiar properties of the streptococci or other bacteria at hand in this disease These streptococci have the power by growth in vitro and in vivo to produce a soluble filterable substance The filtrates from broth cultures and from influenzal lungs and sputum when applied intratracheally in guinea-pigs have the power, among other properties to cause sharp reduction in leukocytes The reduction in leukocytes has occurred with regularity only in the animals injected with influenza strains and not following injection of streptococci in like dosage from similar conditions showing leukocytosis, or type pneumococci

Infecting Powers of Streptococci—Through a study of the infecting powers of the streptococci in influenza and influenzal pneumonia throughout several epidemic waves, Rosenow has been able to reproduce in animals, by various methods of injection, but particularly by intratracheal injection the picture of influenza as seen in man Likewise, the gross and microscopic changes which have come to be regarded as quite characteristic of influenzal infection have been reproduced

Gastro-Intestinal Influenza—On the basis of the experiments reported Rosenow claims that there is a true gastro-intestinal type of influenza and that green-producing streptococci similar to those isolated from the respiratory type of the disease but which tend to localize in the gastro-intestinal tract are the chief cause All symptoms, however, in influenza referable to the gastro-intestinal tract are not due to localization of bacteria in its mucous membrane The symptoms and findings in influenza are due in part to an anaphylactoid reaction, the severe vomiting and diarrhea noted at the outset of some cases may be an expression of this mechanism

Change in Virulence of Streptococci—The results reported elsewhere following the intratracheal injection into animals of the green-producing streptococcus from influenza have been verified and extended in this study by Rosenow Virulence and mortality increased after one or two injections, then diminished

Value of Monovalent Antistreptococcus Serum in Influenza—Of the twelve patients treated by Rosenow, all but one were critically ill at the time of serum treatment Five recovered and seven died Three of the patients who died were practically moribund at the time of the serum treatment and good effects could scarcely be expected Two others that died showed green-producing streptococci immunologically different from the strain with which the serum was prepared, and in two, hemolytic streptococci caused death In these cases also improvement could not be expected In all cases in which specific agglutination was obtained, marked improvement followed the injection of the serum, and in no case were good effects noted at a time when agglutination tests were negative

Diagnosis of Cardiac Disease—Gilfillan would not place too much dependence on a systolic murmur in the diagnosis of a valvular lesion He advises that other evidence should be demanded when a lesion is suspected, and that the murmur should be searched for at different times and under various conditions

Treatment of Cancer of Cervix.—Combined radium and roentgen-ray therapy is considered by Bissell as a treatment of choice in all cases of cancer of the cervix In early cases, conservative surgery followed by radiation is justified but probably the latter alone will prove equally efficient Cases of cancer of the fundus should all be submitted to operation, but the patient should be given the added benefit of postoperative radiation Bissell would accept radiation as a specific in hemorrhages due to myoma or fibrosis or those of unknown etiology

Tuberculosis of Thyroid—Seven cases of this type have been under observation in the Mayo Clinic. They are divided into three groups (1) cases with high degree of hyperthyroidism, (2) with a moderate degree with hyperthyroidism (3) hyperthyroidism mild or absent. In each case the diganosis was made after the enlarged gland had been removed by operation The greater the tuberculous involvement the less severe the toxic symptoms Broders believes that all cases of tuberculosis of the thyroid are secondary to some focus elsewhere in the body, although none were discovered in the seven patients

Wandering Spleen—In a case of uterine polyp causing bleeding Smith found on examination, a mass to the right and above the uterus, firm and smooth, and extending as high as the umbilicus The uterus could be distinctly outlined apart from the mass but there seemed to be a close connection between the two structures During examination the tumor would suddenly jump to the left iliac region, causing pain Blood examination was negative A diagnosis of subserous fibroid was made At operation the mass proved to be the spleen attached to the right ovarian region by a fibrous adhesion The pedicle measured 1½ inches in diameter with veins about three-eighths inch in diameter extending from the spleen diagonally across the abdominal cavity to the normal splenic region The spleen was removed Statements made by the patient seemed to justify the diagnosis of malarial spleen One month after the operation, the blood count was virtually normal

Injury to Larynx—A steel worker was struck in the neck by a small fragment of hot steel. Shortly after the injury he experienced great difficulty in breathing, and had a spasmodic cough and severe pain in the region of the wound. On admission to the hospital the patient presented the cardinal signs of laryngeal stenosis, an anxious expression, husky voice, a well marked cyanosis, recession of the accessory muscles of respiration, and difficulty in swallowing. On examination, there was found a small cut to the left of the median line of the neck, extending through the left wing of the thyroid cartilage, through which a small quantity of air was escaping. There was some emphysema in the tissues of the neck. Indirect examination of his larynx showed the arythenoids were swollen, the left immovable, the vocal cords could not be seen, and the lumen of the larynx was greatly narrowed. By means of the roentgen ray the foreign body was located. The findings being the same as before the wound was again cocainized and by means of the fluoroscope, and a probe between the larynx and esophagus, it was removed.

Cancer of Larynx—The entire clinical picture in Ballin's case gave the impression that it was an ordinary case of subacute laryngitis. Under local treatment there was a gradual improvement in the inflammatory condition, with the exception of a small polypoid elevation about the size of a pea which remained in the anterior portion of the left vocal cord near the anterior commissure. Ballin removed the growth by the indirect method. The pathologic diagnosis was carcinoma. The patient refused to submit to a major operation, and as his throat assumed a more healthy appearance, and his voice almost returned to normal, Ballin advised him to have nothing done for the present. Two and a half years have elapsed, and there has been absolutely no signs of recurrence.

Wire in Esophagus—A patient had been in the habit of swabbing his throat with a heavy copper wire, one end of which was wrapped in cotton. During one of these manipulations the wire was pushed down so far that attempts to get it out were without avail. Esophagoscopy showed the upper end of the wire embedded in the lateral wall of the esophagus at a point about 9 cm. below the cricopharyngeal constriction, that is, about 25 cm. from the upper teeth. Because of fixation of the lower end of the wire, it had to be removed by means of gastrostomy. The patient died thirty-six hours after the operation from pulmonary embolism.

Transfusion of Blood in Nephritis J Ramsay, Blackburn—p 766

Inherited Syphilis Cause of Epilepsy—Haynes believes that the large majority of cases of epilepsy occurring in the young are due to syphilis either in the parent or in the grandparent. In fact, he suspects strongly, there is a want of stability about children of syphilitics. Of the wives of men who had syphilis, some seem to be unaffected and live to a good age but a certain number die young. Haynes refers to four or five instances of such women who have died from so-called puerperal fever and several who have suffered from albuminuria, convulsions or iliac thrombosis during or after pregnancy. One woman who had exophthamic goiter was cured by mercury. Other instances of diseases occurring in those known to be affected with syphilis are Dupuytren's contracture, so-called tuberculous glands of the neck, and ulcerative keratitis. Haynes believes that Bright's disease is

Severe Fatal Internal Injuries Without External Signs—Masters reports the case of a man who fell down a mine shaft for a distance of 150 feet He lived for one and a half hours after the injury There were no abrasions or bruises of any kind on the trunk, externally or internally On opening the abdomen three pints of red blood escaped The spleen, four times its normal size, was badly lacerated near the hilum, the splenic vessels were completely torn off, but the spleen was not separated from its normal bed The cardiac end of the stomach was lacerated for 4 inches, and the stomach contents were free in the abdomen There was hemorrhage into the pancreas and great omentum

Case of Postoperative Tetanus E L Parry—p 460

Ferric Chlorid Test for Diacetic Acid—When testing the urine of a patient who had been taking sodium bicarbonate for gastric hyperacidity, Maxwell noticed a red color with ferric chlorid similar to that obtained with diacetic acid As there was no reason in this particular case to suspect acidosis and as the reaction of the urine was intensely alkaline, it occurred to Maxwell that the sodium bicarbonate might be the cause of the red color with ferric chlorid Repeated tests showed that if sodium bicarbonate were added to normal urine and then ferric chlorid, the urine became a similar red color to that obtained in the presence of diacetic acid In further experiments the urine of the author after ingestion of approximately 6 gm of sodium bicarbonate during a period of twenty-four hours, also gave a red color on the addition of ferric chlorid Presumably the ferric chlorid reacts with the bicarbonate to form ferric hydroxid which dissolves in the excess of ferric chlorid to give the red color, carbon dioxid being evolved during the reaction The more bicarbonate present, the deeper the red color produced In all cases of acidosis which are being treated with alkalies, it is essential to exclude the possibility of sodium bicarbonate being responsible for the development of the red color when ferric chlorid is added to the urine If this precaution be overlooked, the dosage of alkali may be increased in the hope of overcoming an acidosis which in reality does not exist

Myotonic Reaction as Early Sign of Pulmonary Tuberculosis—Dautrebande has been studying the local transverse contraction in the muscle which follows pinching or tapping the margin of the trapezius, pectoralis or biceps, revealing the extreme excitability of the muscle in the segment irritated, under the influence of the toxins of tuberculosis He obtained a positive reaction with one or more of these muscles in all but six of the hundred tested The muscular system must be completely relaxed, and the test must never elicit pain in a region free from pain, and it is well to grease the fingers Sometimes the reaction can be felt with the fingers, when it is not pronounced enough to be visible Halbron calls the reaction *la corde musculaire*, and Dautrebande speaks of it as a muscular wave saying that it is of constant occurrence in active tuberculosis, and throws light on the localization, the extent, and the more or less progressive course of the lesions

Serotherapy of Hemophilic Intestinal Hemorrhage—The young man had been admitted to the hospital for roentgen treatment of mild exophthalmic goiter, when he began to pass blood by the anus In three days he had seven stools of almost pure blood, from 200 to 300 c c a day, and there was a history of frequent and excessive protracted epistaxis He was given two injections of 10 c c of rabbit serum-serique, that is serum from rabbits in a state of anaphylaxis to horse serum There were no further hemorrhages, and sixteen days later the blood coagulated in four minutes and thirty seconds, instead of the ten minute interval before the serotherapy

Pituitary Treatment of Diabetes Insipidus—The woman in the case reported was quite obese but no influence on the obesity was noted from the pituitary treatment although it proved promptly effectual so far as the polydipsia and the polyuria were concerned Nothing could be found otherwise to indicate pathologic conditions in the pituitary body

*Thyroid Treatment of Hemorrhagic Tendency L P Bottaro and J C Mussio Fournier—p 519

Cancer Metastasis in the Brain—One breast had been removed for cancer twenty years before and the other for the same reason eighteen years afterward Then multiple metastases developed in the brain

Tetanus from the Uterus—Nine days after an abortion, tetanus developed but the woman recovered under serotherapy for fifteen days a total of 2 240 c c of the antiserum

Acute Cholecystitis of Typhoid Origin—Fiessinger reports a case in a man of 44 in which, in the course of recurring gallstone colics inflammatory processes in liver and kidneys were explained by discovery of the typhoid bacilli in the blood, but there were never any symptoms of typhoid fever The gallstones subsided into a latent phase, and the man was soon cured otherwise

Healthy Infants Born During Recent Syphilis of Parents.—Pinard and Levy-Solal report two instances of the marriage of a man who had contracted syphilis four or three months before, but had been given vigorous arsphenamin treatment in the interim The bride conceived almost at once, and her blood soon responded positively to tests for syphilis although there were no clinical manifestations Both man and wife were given thorough treatment, and the child was born apparently entirely healthy and has shown no signs

of syphilis to date, up to seven months from birth No portal of entry for the virus could be discovered on the women They bore the arsphenamin treatment perfectly, it has no feticidal action, the writers say, and can be given in proper doses to the pregnant

Thyroid Treatment of Hemorrhagic Tendency —Bottaro and Mussio report from Montevideo a case in which metrorrhagia, epistaxis, hemoptysis and purpura were superposed on symptoms of mild thyroid deficiency slight puffiness of the face, dropping out of the eyebrows, and vasodilator symptoms The patient was a girl of 19 who had borne a child at 14 and had had three induced abortions since Under thyroid treatment the hemorrhagic tendency seemed to subside

Cumulative Action of Emetin —Mattei found in men taking emetin that it was eliminated in an irregularly intermittent manner, and was retained so long that it accumulated in such amounts as to be actually toxic This retention over prolonged periods was observed when the emetin had been injected by the vein as well as subcutaneously He warns that 1 gm is the maximal safe dose for man, even when this amount has been reached in the course of a month of treatment interrupted by weeks of suspension

Extra-Intestinal Typhoid —The young woman developed what seemed to be acute articular rheumatism and it yielded in the usual way to the salicylates in less than a week but typhoid bacilli were cultivated from the blood The disease was thus a typhoid septicemia affecting the joints apparently exclusively

*Hypercholesterinemia in Chronic Nephritis Cordier Boulud and Colrat —p 81
*Epithelioma of the Bladder E Jeanbrau and others —p 89
*Nephrotomy in Anuria from Eclampsia M Gerard —p 97
Calculi in the Ureter Child and Two Adults Recovery After Operation Giuliani and Arcelin —p 113

Hypercholesterinemia in Chronic Nephritis —In the case described by Cordier and his co-workers, the farmer of 33 had incipient chronic nephritis with a large heart and high blood pressure, with polyuria albuminuria edema of the legs and impaired vision but only 0 6 per thousand urea in the blood, and the fundus of the eye was normal The complexion was of a jaundice type but more orange than yellow and there was no excess of bile pigments to be detected but the cholesterin content of the blood was high The man was kept in complete repose and allowed only milk and large amounts of green vegetables with revulsion etc In a month the cholesterin content had dropped from 6 4 to 3 2 per thousand and the blood pressure at the same time had declined to 180/100 The subjective improvement kept pace with these findings and clinical health was regained for an active life The patient was *un rasculaire* and not yet *un renal* Excessive functioning of the suprarenals was evidently responsible for the exaggerated production of cholesterin

Epithelioma of the Bladder —The epithelioma in the woman of 62 had developed on an old papilloma which had been noted for twenty-eight years before the four years of the malignant tumor The structure resembled both syncytium and sarcoma

Nephrotomy in Anuria with Eclampsia —Gerard has been able to find only four cases on record in which nephrotomy was done to relieve anuria in eclampsia with recovery of two of the patients He adds another successful case to the list Spontaneous delivery occurred thirty hours after the first convulsion but this did not arrest the eclampsia The most prominent symptom was the anuria with its train of incessant diarrhea, dropsy and mental confusion The kidney began to function anew the evening of the operation but only the kidney that had been incised The other kidney *did not begin to work properly until forty eight hours later* The profuse diarrhea had substituted to some extent the lacking renal function It is possible that there may have been preceding retention of salt and water which may have contributed to the development of the eclampsia the progressive anasarca seems to sustain this assumption He compares with this case the literature on decapsulation in eclampsia Albrecht has compiled 62 cases with 40 per cent mortality Lance 78 cases mortality 28 2 per cent Poten 98 cases mortality 38 8 per cent In the 7 cases of eclampsia with anuria decapsulation had a mortality of 57 per cent For these and other reasons he advocates nephrotomy with a long incision and drainage of the pelvis under nitrous oxid, without waiting until the patient is moribund

*How To Tell When Tuberculosis is Cured L Renon —p 502
*Spiroscopy in Respiratory Disease J Lecher —p 504
*Albumin in Sputum M Salomon —p 508

The Present Conception of Tuberculosis —Renon cites recent research by Madelaine which demonstrated that the tubercle bacilli are not digested by the phagocyte like other bacteria the phagocytes incorporating them die but the micro-organism is left intact The tubercle bacilli may be promptly phagocyted and have lost their acid staining property but eight hours later inoculated in guinea pigs they cause fatal infection A latent infection entails considerable resisting power against a new infection But if the new infection is intense and the bacilli very virulent then the superposed infection induces a rapid necrotic process with expulsion of large amounts of bacilli causing new foci from the swallowed and inhaled bacilli and scattering the infection to others He explains how this combination of immunity and hypersensitiveness is the guide to prophylaxis and describes what is being done in France

Value of the Tuberculin Reactions —Calmette state that at least 95 per cent of adults in the large towns of France give a positive response to the skin and intradermal tuberculin tests But in young children and especially in infants they warn of recent tuberculous infection

Marriage of the Tuberculous —Sabourin says that he and many other physicians know of women with chronic tuberculosis who yet have passed safely through several pregnancies They are usually of a dry muscular nervous type and they have come unscathed through several acute pleurisies as they have a good organic balance and are able to stand strains without their being reflected in the lungs After the

stress of childbirth, he says, it is important to ward off menstruation for a time, and hence he advises lactation, letting the woman nurse her babe to the end, possibly with a little supplementary feeding for the infant By thus warding off the return of the menses, the organic balance has time to get reestablished, and this practice has always proved successful in his experience The tuberculous women who have their lung disease transformed into acute phthisis by parturition are those with comparatively recently acquired infection, and the lesions have kept subactive, who are ultrasensitive to all overexertion and internal intoxications, menstrual and others, with an unstable organic balance, to say nothing of those with impaired heart, kidneys or liver Women of this type should not be allowed to become pregnant

Injection of Air in Pleurisy—Weil emphasizes the importance of this after evacuation of the effusion not only for the diagnosis but in treatment of all forms of pleurisy It often aids in the care of the purulent form, facilitating surgical measures

Serotherapy in Tuberculosis—Cavasse declares that this is not a promise but a reality now Applied in time, serotherapy is the supreme resource in certain forms of pulmonary tuberculosis, especially with hemoptysis as the antiserum is more effectual than normal serum in these cases Serotherapy is also particularly indicated with tuberculous peritonitis and pleurisy, especially in children He advises against serotherapy for the aged, the asthmatic, the nephritic, and with tuberculous laryngitis It is almost certain to fail when the tuberculous organism is unable to respond to tuberculin or when the fever keeps at an even height with scarcely any ups and downs The antiserum made by A Jousset's technic, is injected subcutaneously, about 2 c c per kilogram of weight With extensive lesions, the dose is smaller from fear of inducing too severe a focal reaction A single injection may suffice, but three or four is the usual rule, never over twelve The intervals are eight days at least The temperature is such a reliable criterion that if it does not show marked modification after two injections, Jousset abandons the treatment

Deviation of Complement Test for Tuberculosis—Renon insists that the reaction of fixation should be included as a routine procedure among the biologic tests for tuberculosis The findings are negative when the tuberculous lesion has healed

How to Tell When Tuberculosis Is Cured—Renon decides this by the reaction to the progressive resumption of active life This test of *adaptation progressive a l'activité* is best made in the late summer and fall, thus training the patient to stand the winter

Spiroscopy—THE JOURNAL has described Pescher's device for measuring the capacity of the lungs by blowing into a jar, watching the displacement of the water in the jar He relates here that experience is confirming more and more the advantages of this method of training the lungs to greater expansion

Albumin in the Sputum.—Salomon regards the test for albumin in the sputum as very important for detection of incipient tuberculosis Negative findings, he says positively exclude tuberculosis, and the amount of albumin is a gage of severity of the tuberculous process The albumin can be precipitated out by heat after getting rid of the mucin with a little acetic acid and filtering, or with potassium ferrocyanid and heat, or with nitric acid alone

Presse Medicale, Paris

May 26 1920 **28**, No 34

Thymus Death A Pulawski—p 333
Action of Quinin on the Heart C Pezzi and A Clerc—p 334

Thymus Death—Pulawski relates that a young epileptic man was found dead in the bath tub face downward but the assumption of drowning during an epileptic seizure was not confirmed by the necropsy findings The thymus, however was exceptionally large for his age and other findings completed the clinical picture of the thymic-lymphatic constitution Pulawski reviews considerable literature on sudden death for which the thymus is responsible, and cites Bartels' figures that status thymicolymphaticus was pronounced in 36 per cent of 126 suicide cadavers, and the lymphatic type in 26 per cent Gluzinski has reported cases of thymus death in pseudoparalytic myasthenia, and others have commented on the frequency of the thymic-lymphatic status in persons with exophthalmic goiter

*Organotherapy for Children F Apert—p 341

Organotherapy for Children—Apert remarks that except for thyroid treatment in myxedema, very little use is made of organ extracts in pediatrics and yet this is a particularly fertile field for them The children's clinics, fetal findings and the results of experimental research all confirm that the suprarenal cortex, like the thyroid, stimulates the nutritional processes But with thyroid excessive stimulation there is emotionalism and a tendency to lose weight, while with suprarenal cortex excessive stimulation the tendency is to obesity and virilism He advises to begin organ extract treatment with small doses for three days each week, watching the pulse, the weight and the excitability With uniform backward growth, he has obtained the best results with a combination of thyroid and suprarenal powder, especially in the thin anemic and frail If the sexual development is precocious he associates pituitary with the other extracts, with or without suspension of the suprarenal extract In mongolism or depressed vitality from any cause this associated organotherapy often whips up the sluggish development and renders the children easier to teach He insists that administration by the mouth is as effectual as by subcutaneous injection The powder can be given with a mouthful of food Calcium seems to promote the action of thyroid extract, and magnesium that of the suprarenal extract The indications for pituitary treatment will be found among the short and stout hairy subjects with precocious puberty, for suprarenal treatment among the overtall, weak and apathetic, and, among boys in those with a tendency to feminine characteristics, for thyroid treatment among those with uniform backward growth gait, speech and intelligence and delayed development of the sexual organs

Plague in History The Avignon Epidemic P Raymond—p 198

Sarcoma of the Clavicle—Aimes and Delord found records of ninety-eight sarcomas among the 126 cases of tumors in the clavicle which they have compiled Pain is sometimes the first symptom exaggerated by movements and cold, and relieved by repose so that it is usually ascribed to rheumatism But an insidious onset without pain is more common With operative treatment long survival is possible, but it is necessary to seek for metastases with extreme care In case of doubt, it is better to remove a secondary tumor than to let a primary sarcoma go untreated With sarcoma, the entire clavicle has to be removed Syphilitic lesions in the clavicle are painful with nocturnal exacerbations Exostoses generally develop at the end of the bone and accompanied by exostoses elsewhere Sarcomatous degeneration of callus in the clavicle is known In a personal case described, the boy of 11 can use his arm normally and there has been no sign of recurrence during the three years since the clavicle was removed

Vessel Grafting—Mauclaire gives a summary review of the success that has been realized with implants of arteries and veins to reconstruct vessels and to restore musculomembranous passages or as a sheath to protect a nerve

Stenosis of Esophagus from Anomaly of Subclavian Artery G G Moppert and J Baumgartner—p 318

Epidemic Hiccup—Gautier relates that at Geneva recently he encountered five cases of intense spasmodic hiccup coming on suddenly persisting for from two to four days and then disappearing with equal suddenness without the treatment having much effect The patients were four men of 30 to 45 and one woman of 46 The lumbar puncture fluid was found practically normal in the one case examined Similar epidemics of hiccup have been reported from Paris and from Berlin recently, and some regard them as an attenuated form of lethargic encephalitis

Arsphenamin in Sciatica—Veyrassat gave arsphenamin by the vein as a last resort in a case of severe sciatica and the prompt benefit encouraged him to try this treatment in four other cases in which compression of the nerve could be excluded In one of the cases the cure was explained by the suspicion of syphilis, in two others tuberculosis was evidently responsible He asserts positively that arsphenamin has an unmistakable action on tuberculous adenitis, but this cannot be the explanation of the benefit in these cases as the sciatica subsided in two days before any swollen glands had had time to be influenced Whatever the explanation, the fact remains that rebellious sciatica subsided after a single injection of 15 cg of neo-arsphenamin in the case of one man of 40 with a family history of tuberculosis In the other cases one or two injections answered the purpose

*Paratyphoid Gastro-Enterocolitis B Stein—p 155
*Rumination in Infancy Eva Somersalo—p 167
*Secondary Acute Pancreatitis H Wildberger—p 192
*Catarrhal Jaundice W Buchbinder—p 231
*General Dilatation of the Esophagus A Huber—p 250

Paratyphoid Gastro-Enterocolitis—Stein describes the clinical picture rectoscopic findings and the complicating peritonitis in the acute and chronic form of paratyphoid B disease The characteristic picture in the rectum is extreme hyperemia and swelling of the follicles with serous infiltration of the tissues catarrhal rather than resembling typhoid In his two chronic cases there was an ulcerative colitis He does not know of any literature on chronic paratyphoid infection of the digestive tract except Schottmuller's case A seropurulent enterocolitis seems to be the bridge between the acute and the chronic form

Rumination in Infants—Somersalo has found records of 32 cases of rumination in infancy and describes in detail 2 cases personally observed It usually lasts in infants about five months but may persist up to eight months, one was cured by a change from fluid food to a thick gruel form Diversion of the child's attention proved an important factor in the cure as a psychic factor is unmistakable Alkaline kefir conquered the rumination in one case and complete change of scene in another Several infants were cured when transferred from an institution to a private home confirming Landau's remark that 'rumination is a cage disease' The literature on the subject and on conditional reflexes in general is reviewed including Strauch's article in THE JOURNAL, Aug 21 1915 p 678

Secondary Acute Pancreatitis—Wildberger compares a case personally observed with a number on record in which acute suppurative pancreatitis developed from a perforating gastric ulcer Also a case of acute phlegmonous pancreatitis from involvement in an infectious process starting in the common bile duct In two cases of pernicious anemia the pancreas was found apparently normal at necropsy but in a third case the pancreas showed signs of two waves of acute pancreatitis No cause for the pernicious anemia could be discovered in this case and he compares it with the literature on the causation of pernicious anemia He has found four cases on record in which changes were found in the pancreas during mercuric chlorid poisoning, and reports two cases of this mercurial pancreatitis, but the islands of Langerhans were intact

Catarrhal Jaundice—Buchbinder's experience with 300 cases confirmed that the course is from three to four weeks the cause some inflammation in the liver of toxic origin entailing some modification in the composition of the bile The liver is always large and tender in the first week and the most effectual treatment of catarrhal jaundice is the application of moist heat to the liver region The spleen is also large and soft but not painful and soon subsides to normal The kidneys also show signs of inflammation and there may be considerable sediment in the urine but we should not be too hasty with the diagnosis of nephritis In every case of catarrhal jaundice there is latent insufficiency of the stomach glands Unless the diet is carefully regulated the secretory function may be permanently injured in only eight of the seven cases kept long under observation as the stomach secretion left normal When diarrhea with catarrhal jaundice it can generally be traced to achylia In recurrent

the aim should be to ward off gastro-intestinal complications rather than to check the jaundice

Dilatation of the Esophagus—Huber concludes from analysis of the roentgen findings in his fourteen cases of general dilatation of the esophagus that the main factor is a functional or degenerative impairment of the vagus innervation This causes partial paralysis of the esophagus, and also tends to induce constriction of the cardia Atony of the esophagus is the first phase, and this can be remedied by using a sound to push the food down into the stomach This cures the incipient cases of dilatation and relieves some of the advanced cases, but in others operative measures are indispensable One man with extreme dilatation for twenty-seven years keeps free from disturbances and in good health by eating as usual bread, eggs or chopped meat at each of his three meals Then he pushes down into the stomach all that is left in the esophagus of this food and concludes his meal by pouring through the sound milk cocoa and cream He has improved so much that he now can go three or four days without the aid of the sound

The Conception of Disease Clinical Syziology V von Weizsacker—p 359

Composition of the Blood in Absence of Sunlight—Grober and Sempell found no evidences of anemia in twenty-two horses that had been kept in mines for from five to ten years, at a depth of 225 to 637 meters below the surface Most of them had not seen the daylight for over a year some not for ten years The erythrocyte count was somewhat higher than normal, and the hemoglobin a trifle below normal compared with horses elsewhere

Determination of the Volume of Blood Expelled from the Heart at Each Beat—Wiedemann gives an illustrated description of a simple device with which he measures the fluctuations in the pressure in the air passages in the lungs synchronous with the heart beat and from this pneumocardiogram determines the amount of blood expelled from the heart at each beat

Velocity of the Circulation with Cardiac Insufficiency—Vorpahl induced insufficiency in the rabbit heart by injury of the tricuspid valve and then by comparing the oxygen content in the right and left heart he found that retarding the velocity of the blood stream by one fourth or one third entailed pronounced signs of stasis in various organs

The Venous Pulse with Continuous Arrhythmia—Weber concludes from his study of forty-one cases of arrhythmia perpetua that the importance of the auricles for the circulation has never been appreciated enough He discusses the different types of continuous arrhythmia in connection with the venous pulse and the electrocardiogram

Reinfusion of Extravasated Blood—When persons were bleeding to death from internal hemorrhage especially from ruptured tubal pregnancy reinfusion of the extravasated blood has been successfully applied, Doderlein relates, in fifty-one cases on record to date, and he has applied it in five cases himself with equal success He obtains the blood by lowering the pelvis so that the blood runs out of a groove in the abdominal wall retractor, pouring directly into a gauze-lined funnel which filters it into an Erlenmeyer jar He introduces a glass tube into the ovarian vein, exposed by the operation the pelvis low, and lets it fill with the blood (citrated) from the funnel Then on raising the pelvis, the blood flows into the vein directly from the funnel The effect is wonderful One who has once seen it will never doubt the wisdom of this "own blood infusion" If there is doubt about the blood being contaminated, it can be injected by the rectum or subcutaneously Of course the procedure is indicated only when there has been a comparatively sudden and extensive loss of blood and the blood is fresh Placenta praevia rupture of the spleen of the liver gunshot wounds of the spleen and of the lungs have been given this treatment with success It not only resuscitates the moribund but aids in the more rapid convalescence, he says, and restores the immune bodies which the system has been accumulating through life

Tuberculosis of the Testis—Els summarizes seven of his own cases and recommends early operation in all cases of tuberculosis of the testis (whether unilateral or bilateral) in which the diagnosis is certain If a typical resection of the epididymis is no longer possible without danger of a recurrence a portion of the testis about the size of a filbert should be reimplanted, in order that the patient though deprived of potestas generandi may preserve libido and potestas coeundi and the accompanying energy and ambition as otherwise the manifestations from loss of testicle functioning are far reaching resulting in indolence loss of energy and general indifference toward one's surroundings He advises the reimplantation in the scrotal sac of the certainly sound parts of the testicle even when the disease process is restricted to one side This saves what is savable and may be of great advantage if the other side becomes pathologic later The implanted testicle in one case described in detail can still be palpated as of the same size and normal movability

Acute Abscess of the Prostate—Praetorius recommends the opening of an acute abscess of the prostate through a median buttonhole incision as the easiest and best form of surgical intervention and in many respects superior to other operative methods He describes also what he regards as the indications for operation in general

Jahrbuch fur Kinderheilkunde, Berlin

February 1920 **91** No 2

*Elements in Food That Promote Growth E Freise—p 79
*Blood Pressure Under Epinephrin E Schiff and B Epstein—p 128
Partial Giant Growth F Uebelin—p 134

Diet Elements that Promote Growth—Freise here reports several years of dietetic experiments with white rats (since 1913) The experimental and theoretical deductions harmonize with what has been learned from practical experience in infant feeding emphasizing in particular the importance of variety in the diet, even in the first months of life, especially for the artificially fed The research seems to show that cow's milk lacks some necessary growth-promoting element or the mode of its preparation destroys some element, and this deficiency must be made up for the child to grow properly But on the other hand milk displayed a surprising efficiency in bringing an otherwise insufficient diet up to the proper standard Addition of 10 per cent desiccated milk to an exclusive milk diet brought it up to full efficiency This happened also when barley-malt was added to the food Honey syrup other cereals, beans, casein smaller proportions of desiccated milk, and alcoholic extracts of barley-malt of carrots and of egg yolk failed to display any such action when added to the same diet

Blood Pressure in Children After Injection of Epinephrin—Normal children respond with a considerable increase in the blood pressure, unmodified by change of position With a weak pulse and low tension there may be little if any rise in the pressure, but it rises on reclining if the vasomotor system is stable With unstable innervation, there is usually

a prompt but slight rise in the pressure but no modification with change of position The vessels themselves seem to be partly responsible for the differences

*Composition of Different Parts of the Body E Klose—p 157
*Tests of Intelligence of Young Children J Peiser—p 182
Influence of Whey on Intestinal Epithelium E Freudenberg—pp 201 207
*Constitutional Inferiority of the Circulatory System in Children E Schiff—p 217

Metabolism in the Skin—Klose has been investigating the chemical composition of different parts of the body in the new-born, and here reports the results of his research on the skin of the back from nineteen infants The skin seems to be the first part of the body called on to store water in pathologic conditions and it is also active in the mineral metabolism storing and eliminating mineral substances independently of the water metabolism

Tests of the Intelligence of Young Children—The test which earliest shows reasoning power in a young infant is when it draws a coveted object into its reach by pulling up the counterpane or paper on which the object is lying Infants of 9 months do this Peiser describes a number of other tests for older infants graded for their age and intelligence One of the most instructive tests is to place between the infant and the coveted object a stick with a crooked handle It takes exceptional intelligence for an infant to use the crook to pull up the object

Constitutional Inferiority of the Circulatory System in Children—Schiff classifies children with a constant pallor and irritable weakness of the nervous system but no anemia according as the vasomotor system is unstable or not There is in all a history of headaches dizziness slight syncopal attacks, palpitation and chilliness and the children tire easily and are dull The pulse is small almost thready, the heart sounds are dull at the base and functional murmurs are common The outline of the heart differs from normal and the excursions of the diaphragm are inadequate The blood is not normally distributed throughout the body and the result is an arterial anemia maintaining a vicious circle The reaction to epinephrin differs in the children with stable or unstable vasomotor system, but the effect shows that the instability is an advantage rather than the reverse This constitutional inferiority of the circulatory system enhances the danger from acute infectious diseases

April 1920 **91**, No 4

*Digestion of Meat by Infants P Karger and A Peiper—p 235
*Experiences with Intubation M Hohlfeld—p 240
*Post-scarlatinal Nephritis E Stransky—p 259
Ileus from Helminths Sara von Uji (Budapest)—p 274
Scurvy in Infants H Vogt—p 278

Digestion of Meat by Infants—Karger and Peiper tabulate the metabolic findings in four healthy infants from 2½ to 5 months old before and during periods in which they were given 10 gm daily of boiled beef so finely divided that the particles could be added to the infant's bottle and it could suck the suspension easily No digestive disturbance was noted and the stools were not modified while the nitrogen balance showed a decided gain thereafter Everything indicated that the meat was well digested and that the children thrived on it Lundell has reported excellent results in a large series of infants given meat, egg fish and vegetables after they were 6 months old and Lovgren and Monrad report similar experiences

Experiences with Intubation in Diphtheria—Hohlfeld found pressure ulcers at necropsy in 25 of 99 cases in which intubation had been done At the Leipzig children's clinic intubation was required in 428 of 433 cases of stenosis In some of the clinical cases there was suppuration in the skin of the front of the throat, in some it was the only sign of the pressure ulcer within, but it did not become apparent until several days after extubation The black spots on the tube which are assumed to correspond to pressure ulcers did not always thus correspond in his experience When repeated reintubation is necessary by using a tube of a different shape the pressure is shifted and he advises to try this early not waiting for ulceration In nineteen of twenty-two cases of retained tubes merely using a tube of another model answered the purpose In the three other cases even changing the models several times coating each with alum-gelatin was unable to cure the process He makes a point now of introducing a tube of another model whenever the tube is coughed out By leaving the long tube in place the tissues are protected against stenosis This is especially necessary with infants less than a year old the pressure ulcers were numerous and severer in this group than in others

Post-scarlatinal Nephritis—Stransky describes seventeen cases in which he studied the scarlatinal nephritis and applied treatment according to the latest knowledge in regard to the nature and treatment of kidney diseases He always views hemorrhagic nephritis in a child as suspicious of scarlet fever even when there is nothing in the history to suggest it otherwise The first thing is to rest the kidneys and he allows nothing by the mouth the first day except at most a little water by the spoonful occasionally The second third and fourth day he gives 2 or 3 pints of "malt coffee" with abundance of sugar The child thus gets over 100 gm sugar per day Then 500 c.c. of water is given fasting, if it is all eliminated in from two to four hours he allows more water If not he continues to keep the intake of water low The food is then increased keeping it salt poor and albumin poor potatoes with fat or butter gruels and crackers In his thirty cases there was no death from the nephritis, the only death in the group was from tuberculosis although one child was unconscious with convulsions when admitted and others presented symptoms of actual uremia He warns that the albuminuria may persist for weeks after subsidence of the acute symptoms

Ileus from Helminths—Uji reports a case of ileus in a boy of 7 the symptoms suggesting invagination Nothing to explain the obstruction was found at the laparotomy until a clump of ascarides was palpated through the wall of the small intestine

Monatsschrift f Geburtshulfe u Gynakologie, Berlin

January 1920 **51** No 1

*Premature Rupture of Fetal Membrane H R Schmidt—p 1
*Active Treatment of Febrile Abortion W Kolde—p 17
*Loss of Weight and Fever in the Newborn F Heimann—p 27
*Vicarious Menstruation A Roth—p 41
Artificial Vagina A Herrmann—p 58

Cause of Premature Rupture of the Membranes—Schmidt presents evidence that in certain cases some inflammatory process in the uterine mucosa involves the fetal membranes and is responsible for the premature rupture In a case described there was no external cause for the rupture and six days later a 7 months living child was born The inflammatory process in the cervical mucosa had evidently been responsible for the frequent hemorrhages during the pregnancy and for the weakening and rupture of the lower pole of the membranes under the weight of the fetus and fluid

Active Treatment of Febrile Abortion—Kolde says that at the Magdeburg women's clinic the 1318 cases of abortion or miscarriage formed 19 85 per cent of all the cases at the clinic and they yielded 18 8 per cent of all the deaths at the clinic during the five year period Omitting the cancer cases and the cases of severe puerperal fever they formed 32 6 per cent of all the fatalities The mortality was 3 8 per cent in the cases treated by prompt evacuation of the uterus using the Winter abortion forceps and the fingers or possibly the blunt curet and rinsing out the uterus afterward with hot saline under very low pressure with a two way tube No tamponing unless there was much hemorrhage a little ergot or pituitary ensured the contraction of the uterus

Physiologic Loss of Weight and Transient Fever in the New-Born—Heimann concludes from study of 8441 new born infants during the last ten years that the loss of weight and the transient fever sometimes observed were due to a combination of several factors inadequate nourishment resorption of pyretogenic substances and the conflict between the meconium flora and the milk flora The fever and the loss of weight are harmless and soon made up but the fact that

they occur on about the same day shows the connection between them The number of cases has been much reduced since the infants are placed at the breast the twelfth hour instead of waiting for twenty-four hours as was the rule until the last few years

Vicarious Menstruation —Roth has found 225 cases of vicarious menstruation recorded since 1870 the bleeding occurring from the nose (30 per cent) fistulas skin (10 per cent), lungs (8 per cent) breast stomach, mouth and throat (4 or 5 per cent each), bladder ear eye, intestine, larynx trachea kidneys and vagina (from 3 5 to 0 45 per cent) The bleeding was purely vicarious in 20 per cent and supplementary in 75 per cent In three cases the vicarious hemorrhages from the lungs or bronchi proved fatal Of course only the severer cases are published In one of two cases personally observed the woman began to bleed from the bowel at regular intervals nine months after the onset of the menopause The other patient was a young woman who vomited blood from the stomach, without retching at each return of the menstrual period The stomach content was free from blood during the intervals

February, 1920 51, No 2

Placenta Praevia T Lonne —p 74
*Hemorrhagic Purpura Charlotte Ehrenberg —p 99
Comparison of Methods of Treating the Umbilicus W Lang—p 118
The Internal Secretions and Practical Gynecology B Aschner —p 130

Placenta Praevia —Lonne relates that there were only ten primiparas in his 200 cases of placenta praevia With the central type the fetal mortality was 50 per cent while it was only 30 2 per cent with lateral implantation, the maternal mortality was 13 3 per cent with the central and 1 9 with the lateral In four cases there was internal hemorrhage although there was no loss of blood externally after the version or metreurynter and the uterus was contracting normally An estimate of conditions in the circulation can be easily made with control of the pulse of the systolic murmur, and of the blood pressure with the Riva-Rocci cuff especially if the hemoglobin percentage is determined at the same time By systematic examination in this way we can estimate how much blood the woman has lost and how much more loss she can stand Measuring the girth of the abdomen is also instructive, any increase from the beginning of the birth is abnormal In three apparently moribund women the abdomen measuring 3 cm more than at the beginning of labor an emergency Porro operation brought the mothers and two of the children safely through He advocates systematic abdominal cesarean section for all cases of placenta praevia centralis and for lateral praevia when there has been much hemorrhage With this, the mortality of the mothers in recent compilations of 262 and 125 cases dropped to 4 and 2 4 per cent and the child mortality to 1 6 per cent in the latter group Extraction of the child through the abdomen wards off the excessive stretching of the cervix which is the main cause of atony of the uterus directly afterward It also saves further loss of blood, and averts danger of internal hemorrhage He regards section as indicated when there has been extensive hemorrhages even if the fetus is already dead

Hemorrhagic Purpura —Ehrenberg accepts an essential thrombopeny as the main element in the clinical picture of Werlhof's disease, and describes a case in a girl of 19 in which the purple patches and hemorrhages appeared about eight or ten days before each menses and persisted to the end The menstrual hemorrhages were often so severe as to threaten life An intravenous injection of a blood platelet preparation arrested the excessive menstrual hemorrhage on one occasion, justifying the use of this in threatening hemorrhages No other hemostyptics displayed any efficiency except injection by the vein of a 10 per cent solution of sodium chlorid, which seemed to check partially the hemorrhagic tendency for two hours After splenectomy the blood platelets rapidly increased in numbers, they gradually dropped back again, but never to the former low figure, and the tendency to hemorrhage seemed to be completely cured, the menses were normal and the purple patches did not reappear Certain points in this and other cases of hemorrhagic purpura suggest perverted functioning of the ovaries or some of their elements as explaining the phenomena observed

March 1920, 51, No 3

*Premature Separation of Placenta L Heidenhain —p 145
*Delivery with Narrow Pelvis V Hiess —p 149
*Operative Treatment for Sterility T Seitz —p 177
*Tuberculous Ulceration in the Vulva W Schade —p 190
The Mental Condition of Parturients F Poen gen —p 198 Cont'd

Premature Detachment of the Placenta —The previously healthy quintipara of 33, nearly at term with her sixth pregnancy, had pregnancy nephritis and suddenly signs of profuse internal hemorrhage developed, with intense pain in the uterus There were no signs of life from the fetus, and Heidenhain amputated the uterus without opening it The nephritis may have been responsible for the premature separation of the placenta but this could not be proved by the anatomic findings The rapid recovery from the nephritis confirmed its transient character The umbilical cord was wound around the neck of the child and measured only 39 cm

Delivery with Narrow Pelvis —Hiess reviews the experiences in a recent nine years with contracted pelvis at the Vienna women's clinic of which Schauta was chief at the time of his death The number of births was 2 264 in 1911 and 1 406 in 1918 Spontaneous delivery occurred in 11 1 per cent of the forty-five cases with true conjugate of 6 5 to 7 5 cm in 35 per cent of the 208 with 7 6 to 8 5 cm, in 54 per cent with 8 6 to 9 5 cm and in 47 1 per cent with 9 6 to 10 cm In a total of 419 cases of narrow pelvis spontaneous delivery occurred in 40 per cent but the proportion was 64 per cent among those women who had been admitted to the clinic before or at the commencement of labor This shows the wisdom of the expectant principle followed in the management of the cases but institutional supervision is almost indispensable for this

Operative Treatment of Sterility —Seitz has operated in twenty-two cases in which inflammatory processes in the ovaries or tubes had closed the lumen of the tubes In the majority the adnexa on one side had to be removed so the restoration of the passage was done only on one side in all but two The later history is known of fifteen of the women, conception occurred in two, but both aborted None of the other women have conceived but their menstrual disturbances have subsided The preferable technic is described and the participation of the uterine mucosa in the old inflammatory adnexitis is incriminated in the early arrest of the pregnancy The salpingostomatoplastic operation therefore is not advisable when the inflammatory conditions have been very severe or protracted but otherwise it is justified when the happiness of a household is threatened by the sterility

Tuberculous Ulceration in the Vulva —The extremely chronic course the fistulous passages edema and proliferation suggesting elephantiasis, form a characteristic picture of this manifestation of tuberculosis Schade compares a personal case described with those on record

RELATION OF ORTHOPEDIC SURGERY TO INDUSTRIAL SURGERY*

ROLAND HAMMOND, M D
PROVIDENCE, R I

The development of orthopedic surgery manifests a continuous, healthy growth from its humble beginnings in a past age Born from the urgent needs of countless crippled and deformed who covered the civilized earth, it has attained a healthy manhood in the most pregnant era of the world's history The present generation of physicians has seen this specialty develop from a guild of bracemakers to a fraternity of bone and joint surgeons whose operations cover a fairly large area of the human body

This endeavor has been accomplished by hard and aggressive work It was first necessary to convince the general surgeon that the treatment of deformities could be better carried out by the orthopedist, as he was then called This was the first step in the emasculation of modern orthopedic surgery With the general surgeon devoting himself to the fascinating problems of abdominal surgery, which was then developing into a splendid science, it was but natural for the orthopedist to concentrate on bone and joint surgery He did this so well, in the majority of cases, that he became known as an orthopedic surgeon, and was received into the ranks of those who may safely be entrusted with the scalpel

Then came the World War, providing varied and remarkable opportunities for work and development For the first time in his career—speaking for the great mass of the specialty—the orthopedic surgeon was assigned to the treatment of fresh fractures and of deformities in the incipient stage To be sure he entered by the back door, for he was supposed merely to supervise the application of the necessary splints after the surgical operation had been performed He was not yet fully to be trusted with the surgical care of this class of patients He was, however, fortunately situated New methods of treatment were being brought forth daily He witnessed the evolution of the Dakin-Carrel method of wound sterilization, the new work on osteomyelitis and nerve surgery, the lessons of bone-grafting, the successes and failures of complicated joint fractures

When the orthopedic surgeon returned to civil practice, it gradually dawned on him, as the same light came to others who had witnessed the transformation of those short, active years that this had all been a preparation for a greater opportunity for usefulness

In certain communities in this country it had been recognized for several years that the properly trained orthopedic surgeon was the logical man to treat fresh fractures Whether the fracture is simple or compound, the treatment is principally mechanical, and as such it naturally fell into the hands of the surgeon who had proved himself competent to treat such accidents Since the war the orthopedic surgeon has been more often consulted in cases of severe fracture In some hospitals he has been asked to assume the care of fresh fractures of the extremities Cases of osteomyelitis have lately been placed in his hands He has more frequently been asked to advise in cases of nerve injury, bone-grafting and deformities following accident Where he was formerly asked to apply the external splint he has lately been requested to insert the internal splint

THE FIELD OF INDUSTRIAL SURGERY

If our premises are well founded, all this experience means that the orthopedic surgeon has arrived at the threshold of the greatest opportunity in his career —the invasion of the field of industrial surgery The thought is not a new one Other authors have ably pointed the way I wish to emphasize somewhat specifically the means by which the orthopedic surgeon may have a part in a great movement

It is a far cry from the day when the injured employee of an industrial plant was sent to the nearest physician for treatment, or was placed under the care of a medical man who served all the employees under the contract plan Many of the largest industrial plants in the country now employ full-time physicians who have had special training in industrial hygiene and in the treatment of diseases and accidents Schools of industrial hygiene are being established in medical schools in this country A flourishing periodical the *Journal of Industrial Hygiene,* has recently been added to our current literature The handwriting is on the wall The medical profession must interest itself in this remarkable movement for improving the working conditions of employees, and in the treatment of them when ill or injured

In this movement orthopedic surgery has a definite place Many large industrial plants have appointed a staff of physicians, including all specialties, to furnish medical attention to their employees More industrial organizations will adopt this plan in the near future This can be done in much the same way in which consultants served on examining boards during the selective draft examinations in the late war By such a procedure many a disabling condition will be recognized early, and proper treatment can be instituted Many otherwise efficient laborers will be restored to the ranks of those fit to work or will be eliminated, if unfitted for this particular industry

* Chairman's address read before the Section on Orthopedic Surgery at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

In the actual treatment of injuries, the orthopedic surgeon will be consulted in cases of severe and complicated fractures, especially those involving joints, in nerve injuries resulting in potential deformities, in severe tendon injuries, in cases of bone and joint disease occurring during employment If the case is one which the orthopedic surgeon is preeminently fitted to treat, it should be assigned to him as early as possible after the injury, in order that every reasonable means for preventing deformity and securing early function may be employed It is unfair to both patient and orthopedic surgeon, and disheartening to the latter, if a patient is turned over to him when it is too late to secure the best functional result, or when the treatment consists in the correction of a preventable deformity If he is to be entrusted with the care of the case at all, he should be permitted to see the patient early

The after-treatment in these cases is most important Bakings, massage and active and passive movements are effective only if the best possible result has been obtained by previous surgical and mechanical measures A potential ankylosis will not be greatly benefited by the use of physical therapeutics

PROBLEM OF THE CONVALESCENT EMPLOYEE

The convalescence is the most critical period of the disability for the employee, for the employer and for the surgeon Cooperation between these three factors is absolutely essential in the future, or else industrial conditions will be seriously disturbed The time lost to production in this country by inability to put the injured employee back in his proper place at the earliest moment is appalling when reduced to figures More serious, perhaps, is the effect on the morale of the worker himself A slight influence is sometimes enough to turn an industrious workman into a park bench loafer A man who occupies a hospital bed for eight weeks while a fractured femur is knitting often needs a bit of uplift to turn his steps into the road of sober industry again

Employers and insurance carriers should seek the advice and cooperation of the surgeon, and work through the medium of the nurse and social worker Employment should be provided for the idle man This should begin while he is still in bed or incapacitated, and as soon as he is able to get to his work he should be given some kind of useful employment It is just here that the surgeon and the nurse or social worker can be of the greatest assistance to the employer Too often the superintendent or the foreman of a department is told to give a convalescent light work, without being informed as to the ability of the patient to work Being more interested in securing efficient production in his department than he is in helping to restore this workman to health, the foreman quickly loses interest when he finds that the employee is, for the moment, a negligable factor in production The result is that the injured man is allowed to drift, and his name is simply kept on the pay-roll until he is able to work, or is discharged as incompetent

The surgeon can suggest types of work which the employee can undertake at this stage in his convalescence, and the nurse and social worker, by visiting the working parts of the plant, can see to it that the worker so employs his time that his injured part shall be restored most quickly to usefulness By this means he will be prevented from losing the will to work, which is all essential to his future

Workmen's compensation laws have done much thus far to improve the treatment of the injured employee by providing prompt and skilful medical attention, and by relieving mental anxiety through the payment of compensation during the period of disability The weak link in the chain is the period of convalescence, during which the employee needs friendly coaching to prepare him, physically and mentally, for his occupation This is more important, of course, in what may be termed orthopedic injuries, than in any other class of accidents, on account of the long period of disability In schemes of cooperation, hitherto, the medical man has generally been overlooked He should assert his position and point out the dangers of the convalescent period, for he is the one essential factor in the successful solution of the problem Let him but urge the need of cooperation in this matter, and it will speedily be brought about

---

RENAL GLYCOSURIA*

JAMES EDGAR PAULLIN, M D
ATLANTA, GA

By the term "renal glycosuria," often incorrectly called "renal diabetes," is meant an abnormal permeability of the kidney to glucose while the sugar content of the blood remains within normal limits and the tissues of the body retain their power to utilize carbohydrates in a normal way There accompanies this condition a constant, slightly variable glycosuria which, in the majority of the reported cases, is only slightly, if at all, affected by diet the usual symptoms of diabetes, namely, polyuria polydipsia, polyphagia, loss of weight, etc, are conspicuous by their absence

Certainly this condition is not common, according to our present belief, on the other hand, there are probably many more patients under treatment for mild diabetes who really have renal glycosuria than our present knowledge would indicate The simplified and more general use of methods for the study of blood sugar will be of great benefit in differentiating this group of cases The recent article by Allen [1] reporting three cases of renal glycosuria among forty cases of supposed diabetes, sent to U S Army General Hospital No 9, is of the greatest interest and has given new impetus to the study of this condition

The disease, as in the case herewith reported, is usually discovered during the course of a routine physical examination for some other condition, or the patient may be rejected for life insurance because of the discovery of sugar in the urine The present case is particularly interesting since when the patient was first seen, four years ago, it was thought that he had so-called renal diabetes although at that time this opinion was held without having sufficient proof that such was the case, since then, however, laboratory investigations have confirmed the clinical diagnosis

REPORT OF CASE

History—Mr D No 3104, aged 23 white single clerk in a hardware store came under observation, Aug 30 1916 His family consisting of a father aged 52, a mother, aged 46 a brother, aged 18, and a sister, aged 16, were all living and

* Read before the Section on Practice of Medicine at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

1 Allen F M Three Cases of Renal Glycosuria Arch Int Med 24 523 (Nov) 1919

well, no brothers or sisters were dead There was no history of tuberculosis cancer, nervous or mental diseases or diabetes mellitus in the family The urine from all members of the family had been examined many times and found to be sugar free The patient had had typhoid fever at 16 years of age, and was sick about one month There were no complications, and recovery was complete He had had measles at 18 a very mild attack with no complications, he was in bed only one day His general health had always been very good, he had had no sicknesses except those mentioned Occasionally he had a slight headache, not particularly severe,

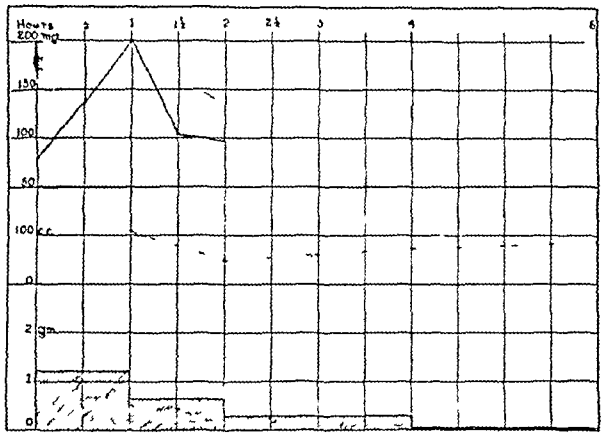

Chart 1—Patient's response to a meal of 98 gm of glucose solid line blood sugar response in milligrams per hundred cubic centimeters broken line urine volume response shaded area sugar output

which was precipitated by constipation The appetite was good, he ate anything and everything that he desired and he never suffered with indigestion or abdominal pains of any character He urinated three or four times during the day never at night, he had never noticed any excessive urination, nor had he had any pain on voiding or any blood in the urine The bowels were regular, there was no diarrhea or dysentery He slept well, always averaging about eight hours, took a great deal of outdoor exercise, walking golf, basket ball and various other sports, smoked about twenty cigarets daily, had never used alcohol except for an occasional drink, and had lost no weight, his average weight being 125 pounds For the last five or six months he had been troubled considerably with acne pustules on the face which he said had been worse during the last three or four weeks and he desired something done for this condition

Physical Examination—The patient was well built and muscular and was 5 feet 6 inches tall The skin presented a healthy color except for the presence of a few acne pimples on the face and neck The pupils were equal and reacted to light and accommodation The eye movements were normal the field of vision tested roughly, was apparently normal the sclera was clear and there was no edema of the lids There was no discharge from the ears the ear drums were apparently normal, hearing was 20/20 The anterior and posterior cervical glands were not felt, the axillaries were slightly palpable and the epitrochlears and inguinals were not enlarged The thyroid was apparently normal in size The teeth were in fairly good condition although a subsequent roentgen ray report showed that four had some infection about the roots, there was a very slight pyorrhea The tonsils were easily seen but presented no marked evidence of infection

The chest was well formed, expansion was good and was equal on the two sides tactile fremitus was normal, the percussion note was clear, and auscultation elicited distinct breath sounds that were apparently normal and free from rales

On examination of the heart the point of maximum intensity was seen and felt in the fifth interspace 8 5 cm to the left of the midsternal line, dulness, 9 5 cm , no increase to the right, there was no increase in the retrosternal area of dulness, the heart sounds at the apex and base were clear and of normal relative intensity The pulse rate was 80 per minute regular in force and rhythm and small in volume, the radial axillary and temporal arteries were not felt The systolic blood pressure was 120 mm of mercury, and the diastolic 80 mm

The abdomen was scaphoid, the edge of the liver was not felt, there was no tenderness or mass to be made out in the region of the epigastrium The right and left kidneys were both palpable the right descended markedly, the upper pole was palpable but was not tender and apparently not enlarged The spleen was not felt and the area of dulness was not increased

The genitalia were normal the prostate was not enlarged or tender and there was no history of venereal infection

The knee jerks were present but not exaggerated Other reflexes were normal There was no thickening about any of the joints The spine was straight, there was no lordosis or kyphosis The muscular strength was very good, there was no disturbance of sensation and no tremors were made out Rectal examination revealed only a few small hemorrhoids

Laboratory Examinations—Blood examinations revealed red blood corpuscles 4 600 000, white blood corpuscles 6 800, hemoglobin 90 per cent Differential count revealed nothing abnormal The Wassermann reaction was negative The specific gravity of a casual specimen of urine was 1 023 It contained a marked trace of albumin very heavy sugar no acetone or diacetic acid an occasional leukocyte and an occasional hyaline cast A twenty-four hour specimen consisted of 1 650 c c , it was of acid reaction, the specific gravity was 1 026 there was a moderate trace of albumin, sugar was 2 1 per cent *There was no acetone or diacetic acid, an occasional hyaline cast was observed* Night and morning specimens of urine were collected separately It was soon observed that the albumin in the morning specimen was decidedly less than in the night specimen and after a period of rest for twenty-four hours it would disappear (*This condition was* regarded as postural albuminuria) It was also found that no relationship could be shown to exist between the amount of sugar excreted and the amount of albumin present in the

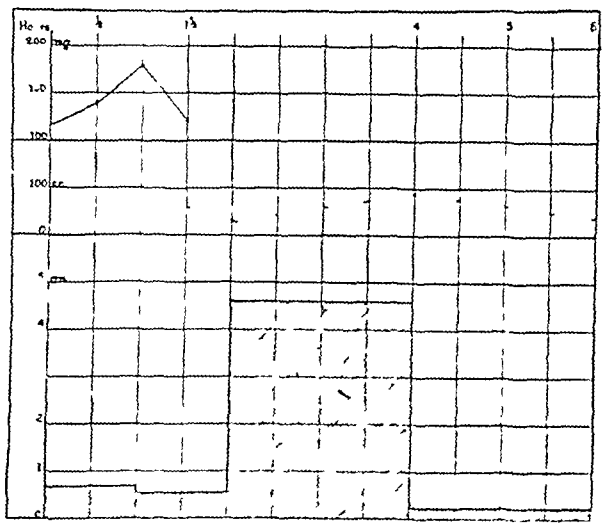

Chart 2—Patient's response to the ingestion of 147 gm of glucose solid line blood sugar response in milligrams per hundred cubic centimeters broken line urine volume shaded area sugar output

urine Repeated and numerous examinations of single and twenty four hour specimens of urine were made all showing the presence of sugar of from 0 5 per cent to 2 1 per cent The phenolsulphonephthalein output in two hours was 65 per cent Examination of the feces was negative No blood sugar studies were made at this time

Treatment and Progress—This at first was regarded as a case of very mild diabetes mellitus because on diet the patient's total sugar output for the tw

was small An attempt was made by restricting the amount of carbohydrate and protein intake to free him completely from sugar, we were never successful in having him sugar free for any length of time, even on the most restricted diet As a result of these dietetic experiences, it was noted that the twenty-four hour output of sugar was almost as much on a diet low in carbohydrate and protein as it was when the diet was unrestricted Consequently, after a convincing trial and complaint on the part of the patient of weakness and loss of weight, he resumed his usual amount of food with the result that he regained the lost weight and continued his work in comfort, although glucose was constantly present in the urine After this experience, several times repeated, it was apparent that the disease was not a true diabetes mellitus, but one of "renal diabetes" For over three years he was practically on an unrestricted carbohydrate diet, and now the glycosuria is no greater than when he first came under observation He enjoys excellent health and shows no clinical evidence of diabetes

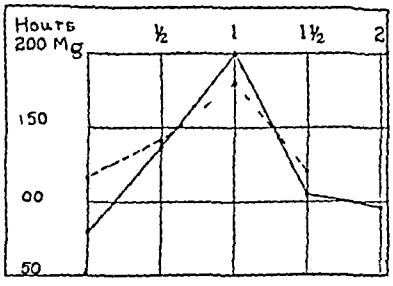

Chart 3.—Blood sugar response as influenced by the ingestion of varying amounts of glucose solid line patient received 1 75 gm per kilogram of body weight (98 9 gm) broken line patient received one half as much in addition (147 gm)

RESULTS OF STUDIES TO DETERMINE NATURE OF THE DISEASE

The patient made many attempts to enter various officers' training camps during the recent war, but he was always rejected because of the presence of sugar in the urine, although he finally did get into some form of government service After his return from this service, the studies recorded in the accompanying charts were undertaken to establish more clearly the nature of the disease

Chart 1 represents the patient's blood sugar, urinary sugar and urine volume response to a meal of 98 gm of glucose given according to the method of Janney and Isaacson [2] The rise of blood sugar was within normal limits, and the urinary sugar distinctly increased with the height of the blood sugar curve, but the output was small in comparison with the intake In other words, with increased glycemia, there is an increased glycosuria, but no increase in the total amount of urine voided

Chart 2 represents the patient's blood sugar, urinary sugar and urine volume response after the ingestion of 147 gm of glucose, which was half as much again as was given for Chart 1 The response on the part of the blood to the ingestion of the increased amount of glucose was a higher rise in the blood sugar curve, on the part of the urine, there was a marked increase in the total output of glucose from the second to the fourth hour, again returning to the usual amount of sugar after six hours One and one-half hours after the ingestion of such a large amount of glucose, the patient showed a slight reaction evidenced by itching of the skin, puffiness about the face, weakness, giddiness and nausea, from which he recovered in two hours Chart 3 is a combination of Charts 1 and 2, for comparison

Chart 4 represents the response on the part of the patient to the ingestion of 98 gm of glucose dissolved in 245 c c of water, with the added juice of one lemon In addition 200 c c of water were given every half hour in order to determine the effect of diuresis on the amount of sugar excreted The blood sugar curve ran unusually high (we have observed in normal persons that such a response occurs when water is given in this way), but returned to its level in two and one-half hours The urine output was markedly increased, amounting during the period of the test to 1,158 c c, and the output of sugar amounting to 7 18 gm The concentration of the urinary sugar was never higher than 1 5 per cent , the lowest is 0 3 per cent It would seem from this that with an increased excretion of urine, there is an increase in the sugar output

Chart 5 shows the results of a recent study to determine the effect of diets, with varying amounts of carbohydrate, protein and fat, on the blood sugar, urinary sugar and urine volume in this patient Fasting for three days caused the blood sugar to remain practically the same, the sugar output in grams slightly diminished with a slight diminution of the percentage of sugar in the urine There was no change in urine volume On a diet rich in carbohydrates, the daily blood sugar percentage remained practically the same, there was a slight increase in the twenty-four hour urinary sugar output, and very little change was noted in the percentage of urinary sugar The urine volume was not increased It is interesting to note that with a diet rich in proteins, the blood sugar percentage showed a rather marked increase, and coincident with the increase in the blood sugar there was a slight increase in the amount of the daily urinary sugar output, but no increase of moment in the volume of urine excreted Allen [1] previously noted the effect of a high protein diet on the blood sugar in patients with renal glycosuria The remainder of the chart shows the results of examinations made while the patient was on an unrestricted diet, no changes of moment were noted either in the blood sugar, urinary sugar or urine volume

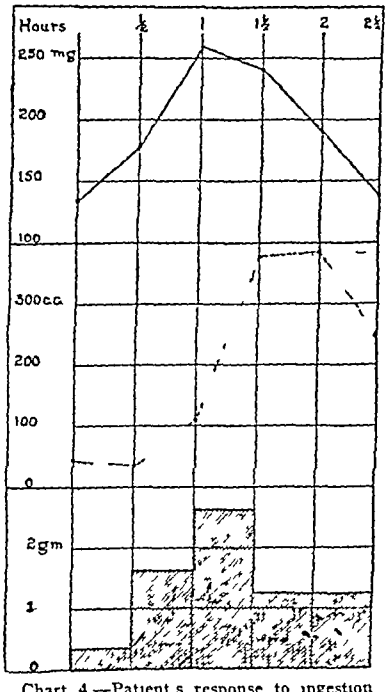

Chart 4.—Patient s response to ingestion of 98 gm of glucose dissolved in 245 c c of water with the juice of one lemon added solid line blood sugar response in milligrams per hundred cubic centimeters broken line urine volume shaded area sugar output

METHODS OF DETERMINING THE PRESENCE OF GLUCOSE

The methods used in determining the presence of glucose in this patient were the copper reduction tests, fermentation test, the formation of osazone crystals with phenylhydrazin, and the determination of the melting point of the crystals The percentage of

2 Janney N W and Isaacson V I A Blood Sugar Tolerance Test J A M A 70 113 (April 20) 1918

urinary sugar was determined with the polariscope and Benedict's quantitative method [3] Blood sugar determinations were made by the Lewis-Benedict method [4] and Epstein's method

I believe that from these studies and the length of time the patient has been under observation, I am justified in terming this a case of renal glycosuria It does not seem necessary or expedient to review the reported cases of this disease, as this has been recently done by Lewis and Mosenthal, [5] Bailey, [6] Beard and Grave, [7] and Williams and Humphreys [8]

The essentials as agreed on by the majority of writers for the diagnosis of this condition are

1 A normal blood sugar content of between 70 and 110 mg per hundred c c of blood

2 The constant presence in the urine of sugar which is definitely known to be glucose

3 Little, if any, change in the glycosuria on increase or decrease in the carbohydrate content of the diet

4 An absence of the usual symptoms of diabetes mellitus

SUMMARY

It seems to be fairly well established that there is a condition in which the kidney is abnormally permeable to glucose The exact nature, cause and the factors determining this permeability are little understood Many of the cases show many points of resemblance to phlorizin glycosuria Among the reported cases there are varying degrees of renal permeability to glucose, whether these are early or late stages in the progress of the disease or the result of a greater or less pathologic condition of the kidney is yet to be determined Few of the patients have been observed for a sufficient length of time to determine definitely whether they develop a true diabetes mellitus or not, although it would seem that such does not occur and the existence of the condition is not incompatible with a normal existence In the case here reported, during the four years of observation, there has been no demonstrable progress of the disease The condition, if it is a clinical entity and if it is due solely to an increased renal permeability, offers certain definite problems for future study

811-817 Hurt Building

ABSTRACT OF DISCUSSION

DR NELSON W JANNEY, Santa Barbara Calif The blood glucose tolerance test proposed by Hammond and Hirschman and as modified by me has proved of greatest value in determining the existence of renal glycosuria It seems as if in typical cases of renal glycosuria we should expect a perfectly normal blood glucose curve, yet in Dr Paullin's case the curve is higher than normal The blood sugar reaction appears to remain unchanged by an increased diet, although there is a slight increase in the urinary sugar One can, however, be deceived in judging these cases merely by the height of the blood sugar I have seen cases, particularly in children in which the blood sugar had not risen over twelve or at the most thirteen parts per ten thousand of blood, but which presented all the typical symptoms of the disease Perhaps it would be a safe rule to consider all cases of glycosuria as being diabetes mellitus until proved otherwise Renal glycosuria may also be found in cases of arteriosclerosis and chronic diffuse nephritis, but true diabetes mellitus may never develop These patients show a remarkably high and prolonged blood glucose curve, probably a retention phenomenon in distinction to the normal curve exhibited by the patients having renal glycosuria of unknown or idiopathic origin

DR ALBERT A HORNOR Boston Dr Paullin told me that he has undertaken some work to attempt to check the influence of water on blood sugar after ingestion of glucose by normals The influence of proteins in these cases emphasizes the point which Dr Allen has made so often that the carbohydrates proteins and fats must all be considered in the management of cases of diabetes All three elements of diet are important

DR ALLAN EUSTIS New Orleans The question of renal glycosuria is a very complicated one and it is only after a careful study of a case that such a diagnosis is justifiable Croftan showed several years ago that cases of severe intestinal toxemia are often associated with the presence of combined glycuronates in the urine which will reduce alkaline copper solutions The urine will not turn the plane of polarized light nor will it ferment with yeast, while the blood sugar will be normal If one judges such a case from the blood sugar and reduction with the urine only as a case of renal glycosuria he will be mistaken Many of these cases are treated as cases of true diabetes often with unnecessary inconvenience and hardship to the patient I see so many of these cases associated with intestinal toxemia which have gone unrecognized for years that I am forced to the conclusion that the profession does not appreciate the importance of determining the identity of the reducing substance in the urine In New Orleans where strong coffee is drunk, it is not infrequent to find urines from patients with deficient liver function which will reduce Fehling's solution

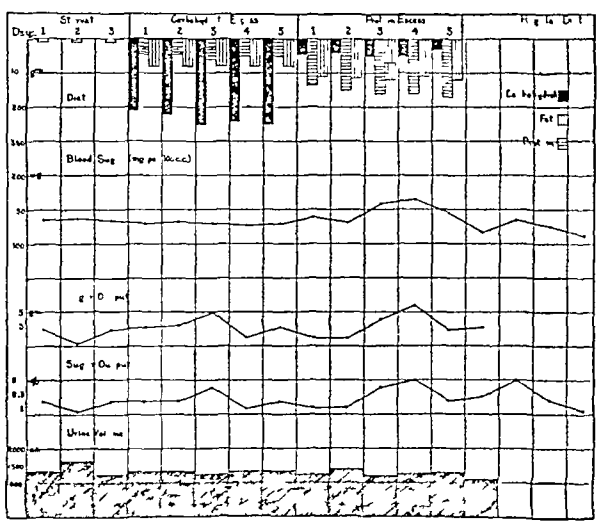

Chart 5 —Blood sugar urinary sugar and urine volume response to diets with varying amounts of carbohydrate protein and fat

Inasmuch as caffein is capable of this reducing action it is probably due to the presence in the urine of this substance

DR JAMES E PAULLIN Atlanta Ga The reducing substance in this case was shown to be glucose by the copper reduction fermentation tests and the formation of osazone crystals with phenylhydrazin and the determination of the melting point of these crystals

A Medical Dramatist—A play that has reached its hundredth presentation in Paris the C Q G d'Amour is said by the *Progres medical* to have been written by Dr P Rehm during a little leisure in the operating tent of the H O E. at Coulommiers July 18 1918

INTRAPLEURAL HYPERTENSION FOR EVACUATING PUS THROUGH BRONCHI

IN SPONTANEOUS PYOPNEUMOTHORAX

ALFRED MEYER, M D
NEW YORK
AND
BARNETT P STIVELMAN, M D
BEDFORD HILLS, N Y

Medical literature shows much conflict of opinion as to the best procedure in cases of pyopneumothorax in tuberculosis This conflict applies with special force to cases in which the pulmonary opening still exists, with discharge of the pleural pus by way of the bronchial tree In the latter case we usually have to deal with an infected cavity and septic symptoms, and the temptation is strong to have a thoracotomy performed, with or without rib resections But this does not appear rational with constant reinfection going on, although recommended by Finlay,[1] Powell [2] and Lord [3] Others dissent from this view and prefer the alternatives of periodic aspiration or continuous air-tight drainage (Fowler and Godlee)

There appears to be general agreement, however, that if we had a method of closing the pulmonary fistula and converting the open pyopneumothorax into a closed one it would be a distinct gain Unfortunately, we are face to face with a double dilemma—there is no method, surgical or otherwise, of dealing with tuberculous pulmonary fistulas, and even if there were, the difficulty of locating them [4] is so great that the proverb of catching a sailor before you hang him to the mast would be an appropriate analogy

The case reported herewith may hold the germ of an alternative method based on the idea of forcing out the pus from the pleural cavity and through the pulmonary fistula by increasing the pneumothorax, and subsequently introducing various solutions like methylene blue or watery iodin, and forcing them through the same route by means of the increased pressure obtained by the added pneumothorax We are, of course, not yet ready to report results, as this procedure was begun only a few weeks ago, but as cases of open pyopneumothorax falling under the observation of any single observer are, on the whole, very few, we wished to draw attention to the method in order to insure its wider trial

REPORT OF CASE

S G a man, aged 26, born in the United States, a porter admitted to the Bedford Sanatorium of the Montefiore Home, Aug 6, 1919, with irrelevant family and previous personal history, stated that he had been in perfect health until he was discharged from the army in October, 1918, when he caught cold and was confined to bed for six weeks, with moderate chills, fever and night sweats and distressing cough Subsequent improvement in all symptoms was marked until April 19, 1919, when he had a severe hemoptysis, losing about 16 ounces of blood Bloody expectoration continued for five days, and he was removed to Bellevue Hospital, April 24, where examination disclosed slight infiltration of the right apex and extensive infiltration with cavity formation in the left lung A left pneumothorax was induced, May 5, but the patient left the hospital of his own accord, June 3, after having received eight inflations The roentgen-ray examination before he left disclosed *almost complete collapse of the left lung and absence of adhesions*

On his admission to the sanatorium in August, physical examination of the chest gave evidence of tuberculous involvement of the right upper lobe, infiltration of the left upper lobe and thickened pleura (?) of the left base Succussion proved the presence of a hydropneumothorax, as did both fluoroscopy and roentgenograms, with the fluid level shown at the fourth rib The sputum was positive, and the urine Wassermann test and tuberculin fixation test negative

In the next five months the patient rapidly improved His temperatures remained nearly normal, he lost his cough and expectoration, and he gained twenty-three pounds The fluoroscope revealed complete absorption of the pneumothorax

About the middle of January of this year the patient began to complain of distressing pain in the left lower midaxillary region This was accompanied by a distressing cough and purulent expectoration A subfebrile temperature was noted in the afternoon, together with tachycardia and absolute anorexia Physical examination was not conclusive No splash could be elicited The left lower chest was markedly dull with a feeble respiratory murmur, but in view of the clinical symptoms and profuse purulent expectoration, the presence of a spontaneous pyopneumothorax with persistent bronchial communication was considered probable, and that was proved by the subsequent evidence

Feb 8, 1920 the white blood count was 15 400, with 70 per cent polymorphonuclears and 14 per cent small and 16 per cent large lymphocytes

February 9 a roentgenogram showed a definite pocket containing air and fluid *the pneumothorax being more extensive than when the patient was admitted* This was proof of a spontaneous pneumothorax as no air had been introduced during his stay at the sanatorium

February 12 exploratory puncture yielded 10 c c of pus, which was identical with the pus expectorated and in both the predominating organism was a gram-negative nonhemolytic streptococcus The pressure after the removal of the *10 c c of pus was +1 to +3 cm[5] of water, but after the* introduction of 100 c c of air, it rose to +8 to +9 Immediately after the introduction of the air the patient raised nearly the equivalent amount of pus (about 93 c c)

The clinical picture did not change for the better in the meantime The fever ranged between 101 and 102 5 and the cough was very distressing March 1, 1920 250 c c of air were introduced the initial pressure being from 0 to +2 cm of water The final pressure was *20* mm of mercury (about 27 cm of water) the mercurial manometer being used because of the inadequacy of the water manometer for such high pressures The patient again expectorated about 60 c c of pus identical with that aspirated and the pressure fell to about 1 mm of mercury (about 1 3 cm of water) March 15, this procedure was repeated for the third time, and roentgenograms were made before and after inflation In all, 100 c c of air were introduced the initial pressure being from 0 to +2 cm of water and the final pressure being +20 mm of mercury (25 cm of water), the patient expectorating *93* c c of pus

A roentgenogram taken after the procedure revealed definitely a fluid level reduction of at least 1½ inches compared with one taken immediately before With the object of getting further proof of the existence of the pulmonary fistula, similar intrapleural hypertension was employed, March *27*, for the fourth time, with the modification of injecting also 1 c c. of a saturated alcoholic solution of methylene blue Immediately thereafter *150* c c of air were injected and during the procedure about 150 c c of blue sputum were coughed up The fever chart showed an average reduction of 2 degrees for three days following this purely diagnostic methylene blue injection

1 Finlay Allbutt s System p 386
2 Powell Diseases of the Lungs Ed 5 p 144
3 Lord Diseases of the Bronchi p 589
4 We have not tried the method of locating the fistula by introducing liquid petrolatum into the pleura and fluoroscoping for escaping bubbles of air

5 All manometric readings are those above or below the zero mark the actual hydrostatic pressure would be double these figures

At our fifth attempt, April 6, we had an interesting experience The initial pressure was from 0 to +1 After 100 c c of air were introduced, the pressure rose to + 20 mm of mercury (27 cm of water) After 300 c c, the pressure had fallen to from —0 5 to + 1 5 cm of water and after 600 c c remained at from —0 5 to + 1 cm of water The low and uniform intrapleural pressure was evidently due to the fact that the air introduced escaped through the fistulous opening Fifty c c of 1 10 000 watery iodin solution were injected into the pleural cavity The patient brought up about 150 c c of pus during the operation The iodin solution did not cause any unusual irritation

Six days later at the sixth attempt, no hypertension was obtainable even for a short period, for there was evidently insufficient pus in the pleural cavity to cover the pulmonary opening

COMMENT

It is our intention to continue this method of expelling the pus, but to follow it at each sitting with injections of iodin of increasing strength, or alternately with methylene blue, in an attempt to close the pulmonary fistula and thus convert the case into a simple pyopneumothorax and ultimately permit a thoracotomy and rib resections, if necessary—this, of course, only if the patient's general condition warrants it The tolerance of the bronchial tree and trachea for solutions of iodin, 1 1,300, has been demonstrated many times in the last three years in the treatment by irrigation through the bronchoscope of nontuberculous bronchiectatic cavities and pulmonary abscesses In such a case seen recently by one of us, the patient stood a strength of 1 650 We have begun with a solution nearly fifteen times weaker merely as a matter of caution

A considerable search of the literature does not disclose any report of what might be called "pneumatic expulsion" of pus from the pleura, nor of the treatment of a tuberculous pulmonary fistula in the way described

The age of the adhesions in this case (probably from 4 to 5 months) seemed to us to justify using very much higher intrapleural pressures than we had ever employed before in ordinary artificial pneumothorax work, because we had less fear of their giving way with the formation of new pulmonary fistulas In addition to this, the very presence of the one proved fistula was to a certain extent a safety valve, as was shown by some manometric readings quoted above and some taken right after the discharge of pus through the mouth, the figures falling promptly to the initial low ones

The location and size of the opening, and hence the posture of the patient, may prove to be a very important element in obtaining pleural hypertension and expulsion of the pleural contents Our experience with the fifth injection proved this, hence, each patient's posture for the procedure may prove to be different

If no hypertension is attainable because the pulmonary opening is above the level of the pus, the chest could be filled with sterile water or with sterile salt solution, and hypertension then applied In fact, this procedure could be employed several times in succession at the same sitting—a species of scrubbing of the pleural cavity—before the final injection of the remedial agent

The method could also be combined with aspiration, leaving the hypertension as the final step for bathing the pleura and fistula with the remedial agent Malachite green or other agents might be substituted for the methylene blue and iodin Malachite green, in particular, has been recommended by laryngologists for its antibacterial and antiinflammatory effect Only a long period and a wide trial will hold out any hope of a probable answer on the relative value of this method and of the different agents used For the present, we can report that the maximum temperatures that had ranged for weeks between 102 and 103 8 have now fallen to between 99 6 and 100 4 daily, and the total sputum of 15 or 16 ounces daily has in the past three weeks averaged only 3 ounces Coincidentally, of course, there has been a considerable improvement in appetite and well-being

ULCER OF JEJUNUM FOLLOWING GASTROJEJUNOSTOMY*

WALLACE I TERRY, M D
SAN FRANCISCO

During the winter of 1901, while in attendance at the clinic of the late Prof Theodor Kocher of Bern, it was my good fortune to see him operate on a patient who had a perforating ulcer of the jejunum, following a gastrojejunostomy of the Roux or Y type Up to that time only six similar cases had been reported, so it excited considerable interest With the idea in mind that the gastric juice was responsible for these ulcers, I carried out experiments with various types of gastro-enterostomy but in no case did ulcers of the jejunum develop Later, in 1903, Watts reported the occurrence of two ulcers of the jejunum, one perforating, in a dog three months after a gastrojejunostomy Exalto, Wilkie, Soresi and others found secondary ulcers of the jejunum following gastrojejunostomy in animals Gronnerud of Chicago, in 1917, found ulcers quite frequently when the internal suture was nonabsorbable In those cases in which absorbable sutures were used, ulcers of the jejunum were only occasionally encountered and were usually minute The work of Gronnerud, based on some 5,000 experiments, is of great value in throwing light on this rather obscure condition He concluded that ulcers of the jejunum, following gastro-enterostomy, were caused almost exclusively by nonabsorbable sutures But this is not the only factor, as some of Gronnerud's, and Hartwell and Hoguet's experiments demonstrate, and as shown also by some clinical experience

It is my belief that the principal factor in the production of these ulcers is the introduction into the jejunum of non-neutralized acid gastric juice, and that trauma, be it from tight application of clamps, injuries of blood vessels or retained sutures, further lowers the resistance of the jejunum or of the anastomotic opening to the digestive action of the gastric juice The fact that, in a series of 155 cases which I have collected from the literature, in addition to three cases of my own, only one case of ulcer of the jejunum followed gastrojejunostomy for cancer of the stomach, lends considerable weight to the idea that the gastric secretion is the prime factor The duodenum has its own succus entericus with bile and pancreatic secretion to act as neutralizing agents, while the jejunum is much less able to protect itself against acid chyme

* Read before the Section on Surgery General and Abdominal at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

When we come to investigate the type of operation which was followed by jejunal or gastrojejunal ulcer, we find that out of 136 cases collected by Wright,[1] posterior gastrojejunostomy was done in fifty-four (40 per cent) while the anterior operation with or without entero-enterostomy was done in seventy-four (54 per cent) In the remaing eight cases (6 per cent) posterior gastro-enterostomy with entero-anastomosis was performed The significance of these figures is apparent, for posterior gastrojejunostomy has undoubtedly been performed much more frequently than the anterior operation, yet fewer cases of jejunal ulcer have occurred following it The further down the jejunum that the anastomosis with the stomach is made, the greater is the probability of development of jejunal ulcer, hence the greater number after the anterior operation because of the longer loop employed A posterior gastro-enterostomy with entero-anastomosis, or a Y operation, means deprivation of neutralizing agents to that portion of the jejunum attached to the stomach

Just what element in the gastric juice is necessary, we are as yet unable to say None of the reported cases give sufficient data as regards gastric analyses before, during and after the occurrence of jejunal ulcers In a few cases, hydrochloric acid was almost entirely absent Whether or not infection is a necessary concomitant is also a debated question The fact that a considerable portion of the reported cases were marginal, that is, involving both the stomach and jejunum at the point of anastomosis, and the further fact that retained sutures have been found at the anastomosis, lend weight to the idea that the nonabsorbable suture is much to blame

REPORT OF CASES

The following three cases have not been previously reported

CASE 1 (7464)—Mr J, aged 32 entered the University of California Hospital June 4, 1914 with the history of a posterior gastrojejunostomy performed elsewhere three and a half years previously for pyloric obstruction For twelve years he had had much gastric distress, often relieved by taking food or sodium bicarbonate Eight years before admission, he had very severe acute abdominal pain which was in all probability due to a perforated ulcer of the duodenum in view of the later operative findings Vomiting had been a prominent symptom previous to the gastro-enterostomy For two years after the operation he had been quite well, but a recurrence of his old symptoms had led to the performance of a second gastrojejunostomy and he was told that the previous opening had almost entirely closed The complaint which brought him to the hospital was pain felt a few centimeters to the left of the umbilicus, and loss of weight and strength Palpation revealed tenderness over the pain area The roentgen ray disclosed a six-hour stasis in the jejunum just beyond the anastomosis opening and a closed pylorus Dr W C Alvarez, who had previously seen the patient made a diagnosis of probable ulcer of the jejunum At operation, June 12, after the freeing of many adhesions of the upper abdominal viscera it was found that we were dealing with an ulcer in the efferent loop of the jejunum about 2 cm from the anastomosis The jejunum was firmly attached to the transverse colon at this point, and the ulcer had almost eroded through into the colon The ulcer was excised, the raw surface on the colon was covered with a tag of omentum, and the open area of jejunum was made a part of the gastro-enterostomy by slightly enlarging the opening into the stomach The internal suture was continuous silk, and the external was linen

The patient remained fairly well for two months, when he had an attack of pain in the left side of the abdomen, followed in twelve days by hematemesis and the passage of bloody stools Five months later he reentered the hospital with much the same complaint as before epigastric distress, sour eructations and nausea, with occasional attacks of vomiting Pain was often relieved by soda or food Analysis of the stomach contents after a test meal revealed free hydrochloric acid 55, total acid 75 After the usual examinations, including the roentgen ray, a diagnosis of ulcer of the jejunum was made At operation Feb 3, 1915 another ulcer of the jejunum was found in the afferent loop close to the stomach This portion of the jejunum was excised and the proximal end implanted into the efferent loop thus making a Y anastomosis It was further found that the ulcer had perforated the wall of the jejunum posteriorly, the base being formed by the pancreas The patient improved somewhat following the operation but fourteen months later it was reported that he had died from intestinal hemorrhage No necropsy was performed

CASE 2 (8216)—Mr O aged 43 entered the University of California Hospital Nov 15 1914 complaining of pain in the right lower abdomen and vomiting blood A gastrojejunostomy had been performed a year previously at another hospital, there being found an old healed ulcer of the stomach near the pylorus with a recent ulcer in the second portion of the duodenum The internal suture was chromic catgut and the external was linen both being continuous The pylorus was plicated The patient remained well for only two months after the gastro-enterostomy With the return of pain there was vomiting and at one time a considerable amount of blood was vomited and also passed by rectum The patient lost 30 pounds in weight Examination revealed a tender mass 4 cm to the left of the umbilicus, a test meal showed free hydrochloric acid 45 total acid 60, the Wassermann reaction was negative and there was occult blood in the stools A diagnosis of probable jejunal ulcer was made At operation, November 16 a marginal ulcer was found nearly encircling the anastomosis, the lumen was thereby much narrowed and would just admit a finger tip The pylorus was patent It was felt that excision of those portions of the stomach and jejunum involved in the ulcer was unwise in view of the patient's poor physical condition, so a gastroduodenostomy was performed after mobilizing the third portion of the duodenum The internal suture was made with chromic catgut and the external with linen Recovery was without incident and at the last report the patient was all right

CASE 3—Miss A, aged 52 was referred to me in 1918 by Dr Eliot Alden of Los Angeles with a history of probable ulcer of the stomach extending back to the age of 25 In 1911 a posterior gastrojejunostomy was performed Nine months later, pain began in the left colonic region, and in 1912, she had two hemorrhages, vomited blood and had tarry stools In 1913 a pylorectomy was performed, but during the next four years there were attacks of pain to the left of the umbilicus and four more hemorrhages A gastric analysis in 1915 revealed only slight acidity Roentgen-ray examination however, disclosed an unusual delay in the passage of barium in the jejunum just beyond the gastro-enterostomy opening In view of the history of persistent pain to the left of the umbilicus the frequent hemorrhages and the roentgen-ray findings a diagnosis of jejunal ulcer was made and operation advised This was carried out, Jan 25, 1918 A gastrojejunal ulcer was found on the anterior wall with considerable distortion and contraction of the jejunum at that point Excision of the entire ulcer and reestablishment of the anastomosis with tanned catgut sutures were carried out Three months later the patient was operated on for acute gangrenous appendicitis Two years later she had pain and tenderness in the epigastrium which were diagnosed as recurrent ulcer, but the symptoms subsided promptly on an

1 Wright (Brit J Surg **6** 390 1919) gives a list of nearly all reported cases Other cases are recorded in Percy Surg Gynec & Obst **10** 316 1910 Carman R D and Balfour D C Gastro jejunal Ulcers Their Roentgenologic and Surgical Aspects J A M A **65** 227 (July 17) 1915 Urrutia Siglo medico **64** 470 (June 30) 1917 abstr J A M A **69** 678 (Aug 25) 1917 Coffey Ann Surg **71** 303 1920

ulcer diet Whether she will again have jejunal ulcer is for the future to tell

In none of the foregoing cases were any retained sutures found, although search was made for them To me, the striking feature in the symptoms presented by these three cases and by many others from the literature was the pain and tenderness to the left of the umbilicus The beginning of the jejunum is just to the left of the spine and at the level of the second lumbar vertebra, while the umbilicus is opposite the third or fourth lumbar vertebra, so I am inclined to believe that the tender area is similar in type to the Head zones Thus the Mayo-Robson point is not directly over the gallbladder, nor is the McBurney point directly over the appendix, but the tenderness is referred to those points May it not be that the pain from an ulcer in the upper part of the jejunum is referred to a point from 2 to 4 cm to the left of the umbilicus?

The value of careful roentgen-ray studies in the diagnosis of these ulcers has been emphasized by a number of observers Perforation of the jejunal ulcers either into the peritoneal cavity or into the transverse colon has been reported in some fifty-five cases, most of them previous to 1910, so that it is fair to presume that earlier diagnoses have been made in the later cases In many of the reported cases of acute perforation, there was a history of chronic antecedent pain or discomfort

CONCLUSIONS

As a result of my study of jejunal and gastrojejunal ulcers following gastro-enterostomy, the following conclusions are offered

1 The exact etiology still remains in doubt, in all probability the principal factor is the diversion of acid chyme into a part of the intestine, which has less neutralizing power than the duodenum The other factors of prime importance are trauma, especially from retained sutures or anastomosis buttons, and infection

2 In view of the very few reported cases of ulcer of the duodenum following pyloroplasty or gastroduodenostomy,[2] it would seem wise to employ those operations in suitable cases

3 Gastro-enterostomy should be performed with much care, clamps, if used, should be adjusted without traumatism of the viscera, only absorbable sutures should be used for the anastomosis

4 Patients subjected to gastro-enterostomy should be instructed as to a suitable dietary, which should be continued for at least a year In addition, antacids should be given if the gastric analyses seem to warrant their employment

5 Patients should be urged to seek competent advice when pain returns

240 Stockton Street

ABSTRACT OF DISCUSSION

DR J SHELTON HORSLEY, Richmond, Va Jejunal ulcer following gastro-enterostomy is found in a small but definite percentage of cases It is of course caused by the gastro-enterostomy Without this operation it is almost never found Undoubtedly unusual trauma and the use of unabsorbable sutures favor its occurrence but when catgut is used and no clamps are employed jejunal ulcer sometimes occurs In large clinics it is estimated that it follows gastro enterostomy in about 4 per cent of cases It seems reasonable to assume therefore, that something in the altered physiology of the stomach is responsible for the jejunal ulcer When a hollow viscus has always had alkaline contents and the reaction is changed to strongly acid, symptoms are produced For every jejunal ulcer there are probably many cases of jejunal hyperemia which also produce symptoms In one of my cases in which a gastro-enterostomy was performed, without clamps a perforating jejunal ulcer developed on the mesenteric border opposite the stoma The best results follow gastro-enterostomy when done for complete pyloric stenosis, and the alkalinity of the duodenal contents cannot be lowered by the passage of acid contents through the pylorus So the unreduced alkalinity of the duodenal contents can better protect the jejunal mucosa at the gastro enterostomy opening than if this alkalinity had been reduced by the passage of the gastric juice through the pylorus It is common experience to get the best result in those cases in which there is cicatricial pyloric or duodenal closure in this type gastro-enterostomy should be done In other types pyloroplasty will cure the ulcer and in a few months the stomach will appear to be practically normal even on roentgen-ray examination

DR WILLIAM J MAYO Rochester Minn In our experience gastrojejunal ulcer rarely occurs if fine catgut instead of silk or nonabsorbable sutures are used in performing a gastro-enterostomy This has also been Moynihan's experience Twelve years ago I reported seven cases of these so called marginal ulcers I have seen very few true jejunal ulcers but I have no doubt that they occur They do occur experimentally in animals The ulcers I have seen have almost always been in the suture line In two cases, nonabsorbable sutures worked through the abdominal wall and were removed from superficial abscesses A very narrow layer of tissue should be turned in and one should be very careful about the blood supply It has been my misfortune to reoperate in some cases of gastrojejunal ulcer in which the ulcer had been excised We now cut off the gastrojejunostomy close the stomach and jejunum and make a pyloroplasty after the method of Finney We have seen gastrojejunal ulcer only three times among many hundred gastro-enterostomies in which catgut was used Carman has shown that a roentgen ray diagnosis of gastrojejunal ulcer can be made in more than 90 per cent of the cases Many of the patients coming back after gastro-enterostomy, with supposed relapses of the original ulcer prove on exploration to have gastrojejunal ulcer with the original ulcer healed

DR. A J OCHSNER Chicago The reason Dr Mayo does not get jejunal ulcers following his gastro enterostomies is not that he uses a certain kind of suture but that he makes his gastrojejunal opening at the lowest point of the stomach so that there is no accumulation of acid gastric juice In all the cases in which I have reoperated for jejunal ulcer there was a sacculation of the stomach I have used silk in all my cases and my proportion of jejunal ulcer corresponds to Dr Mayo's because I followed the principles he laid down twenty five years ago

DR A A STRAUSS Chicago When a gastrojejunal ulcer occurs the surgeon has really produced an experimental ulcer The etiologic factors which produced the original ulcer are still present Producing the trauma to the bowel and stomach using silk sutures and cutting off the blood supply by inverting the edges of the bowel and stomach too much furnish the ideal conditions for producing an ulcer experimentally especially when the etiologic factor the infection is still present in the body Experimentally we have found that if an ulcer is produced and a gastro enterostomy is performed later during the very active stage of the ulcer quite frequently a gastrojejunal ulcer is found when silk is used On the other hand when the gastro enterostomy is performed later when the ulcer is practically healed we hardly ever find a gastrojejunal ulcer No matter whether we believe that a certain particular type of streptococcus produces the infection the important clinical fact is that every excised ulcer contains a large number of organisms The trauma of gastro enterostomy plus the original infection produces the gastrojejunal ulcer I doubt whether the acid

importance of the open method The common duct could have been easily ligated on account of the edema mentioned above making the cystic duct so short as to resemble the common duct, in another case the ampulla of the gallbladder was adherent to the common duct, and until separated from the latter

The hepatic artery must be avoided because our experiments on animals have shown that ligation of this important vessel will result in death

The changes occurring in the liver resemble those of acute yellow atrophy Mention is simply made here of this fact because many obscure deaths follow

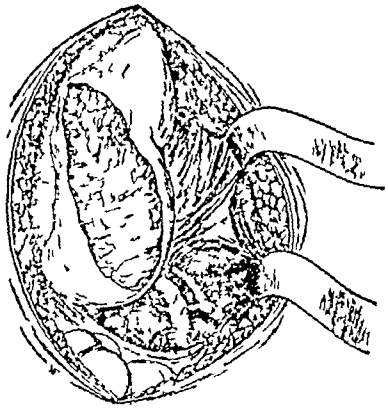

Fig 8—Gallbladder removed, cystic duct ligated close to common duct, cystic artery ligated close to gallbladder

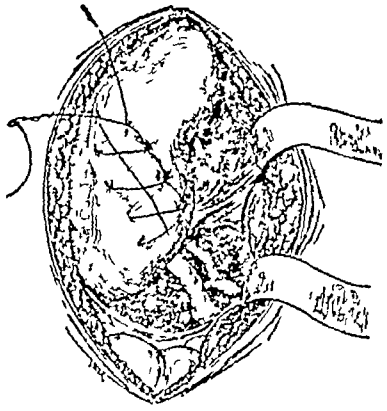

Fig 9—Gallbladder bed brought together with continuous mattress suture

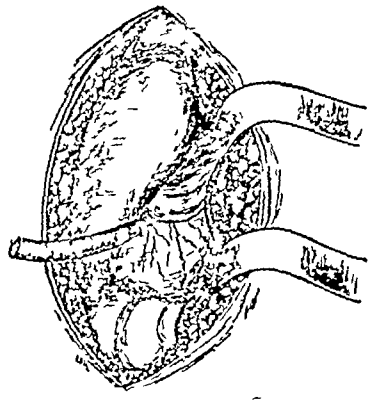

Fig 10—Rubber tube placed near site of operation

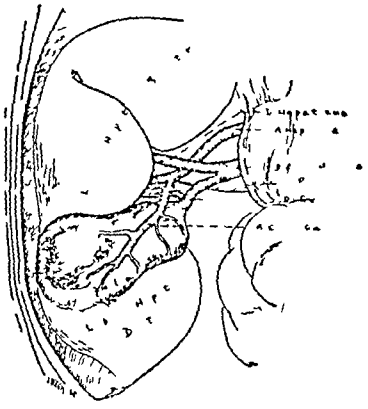

Fig 11—A remarkable cystic artery its size and its numerous branches should be noted

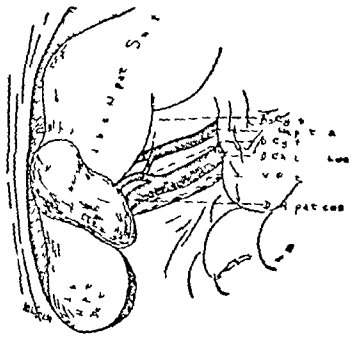

Fig 15—Ventral insertion of cystic duct

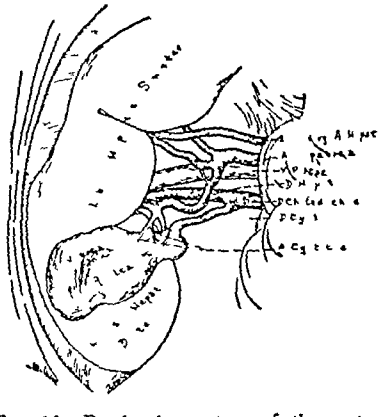

Fig 16—Duodenal insertion of the cystic duct accessory hepatic and cystic arteries

and until the right free border of the gastrohepatic omentum was opened, it was impossible to distinguish the cystic duct from the common duct In still another case the gallbladder was so large and the ampulla extended over such a wide area that the structures around the foramen of Winslow were hidden from view I could cite many more cases to illustrate this point

a supposedly fine technical operation One often hears a report of a case of cholecystectomy in which the patient should not have died, but for some unexplainable reason does so After ligation of the hepatic artery the patient may do, well for a week, when gradually there will be signs of inanition, followed by gradual loss of strength, and finally death Another communication will be made on this subject

after the completion of the experiments Suffice it to say here that this is another plea for the open operation

Recently we encountered at operation a hepatic artery which was in close relation to the cystic duct It curved over the hepatic duct, and dipped down under the hepatic duct to enter the liver The cystic artery was insignificant (Figs 13 and 16) When operation is performed within the omentum in cases of this character, there is often severe hemorrhage because the hemostat does not completely compress the entire circumference of the vessel Then, on account of one's haste in attempting to secure hemostasis, important structures are destroyed

CONCLUSION

It may be stated that the operation of cholecystectomy has lost all of its barriers to a successful result if we perform this operation strictly along anatomic lines The convalescence of these patients is far superior to those of the old operation of cholecystostomy, however, I would admonish those who are not familiar with the points as outlined above to perform cholecystostomies The complications will be less and the mortality will be greatly reduced [9]

ABSTRACT OF DISCUSSION

DR ALFRED C WOOD, Philadelphia Every operation should be based on anatomic and physiologic considerations The importance of accuracy in surgical work needs no argument, and in this particular Dr Behrend's operation is a definite step in advance Ligating structures *en masse* should be avoided, except when it is absolutely unavoidable I wish to commend particularly Dr Behrend's careful description of the exact manner in which the patient should be placed on the operating table The final result in these cases is usually most satisfactory A clean cholecystectomy is followed by a very rapid convalescence and a very high percentage of permanent cures

DR J B HAEBERLIN, Chicago The crucial point in this operation is good exposure In very fat individuals the best incision is the Bevan incision The cystic duct may be ligated and cut at any point that is normal If it is normal it can be tied one-half inch or 1 inch from its junction with the hepatic duct It is important not to tie the hepatic duct At times the gallbladder has been dilated frequently and collapsed, It is large and sacklike, and close to where the cystic duct comes off is an ear formation In dissecting from above downward bring traction on this pouch or ear formation so that the cystic duc can be reached easily In regard to the treatment of the pain after the gallbladder is taken out Richter of Chicago devised a method in which the peritoneum is laid down not sutured tightly, to allow space underneath and the peritoneum grows to the denuded surface Closing the wound by primary union whenever possible is the ideal method

DR M J SEIFERT, Chicago The essayist advised severing the gallbladder as near to its origin as possible If a cystic stump is left long, it will often develop and take the place of the gallbladder and subsequently gallstones may be found in it

DR JOHN J GILBRIDE, Philadelphia Most of the accidents encountered in surgery whether of the biliary passages or anywhere else, are frequently caused by poor exposure of the parts involved In an ordinary, simple case of cholecystectomy one would not have any difficulty, but in some long standing cases, where the right upper abdomen is a pathologic laboratory one cannot be too careful We are concerned not only with primary recovery, but permanent cure

DR E P QUAIN Bismarck, N D For a number of years I have made the transverse incision for practically all biliary surgery It causes less permanent anatomic damage than any other incision It is anatomically correct It leaves an almost invisible scar The longitudinal incision destroys the intercostal nerves This aids in the formation of hernia and the peritoneum is more likely to invite permanent adhesions than is a normally innervated peritoneum The transverse incision does sever the rectus muscle transversely, but this is of no consequence, the cut ends of the muscle are easily reapproximated, and even when they are not sutured they generally come together from a slight overlap of the aponeurosis and from a physiologic relaxation following trauma The exposure gained by this incision is excellent, the incision being parallel with the common duct and lying over the pylorus The appendix has been removed by me through the same incision in 30 per cent of the transverse incisions made for biliary disease Postoperative hernia has been conspicuous by its absence in more than 600 cases Another point of importance the patients suffer less postoperative pain and distress after a transverse than after a longitudinal incision This is no doubt due to the fact that fewer intercostal nerves have been traumatized in the former than in the latter

DR H M RICHTER, Chicago The multiplicity of anomalies met with by Dr Behrend in 167 sections suggests that they are of little importance or our accidents would be far more numerous That the displacement of the hepatic artery is not frequently followed by its ligation or section is obvious from the absence of necropsy findings The ligation of the cystic duct need not be close to the common duct, the literature to the contrary dealing mainly with the cases in which stones or pieces of gallbladder have been left behind Enlargement of the cystic duct as part of the general enlargement of the duct system is of no importance Its mucous membrane is analogous to that of the ducts and not to that of the gallbladder Neither the cystic duct stump nor the raw surface of the liver should be covered by peritoneum, first, because if infected, the peritoneum will better care for it than the retroperitoneal tissues, second, because it is unnecessary to cover the raw surface, and when the attempt is made the peritoneum is lifted from the raw surface leaving a triangular space behind it The quilting procedure described was attractive, but the gallbladder occupies a depression, and when sutured the little flaps of peritoneum do not lie back against the liver The adhesions following cholecystectomy are due more to the drainage material commonly used than to the raw surface left exposed

DR MOSES BEHREND Philadelphia Dr Wood brought up an important point, that the cystic duct and artery must not be ligated *en masse* Many good operators do this It is a mistake No matter how many kinds of incisions you have, if you follow out this technic and open up the gastrohepatic omentum you will never get into trouble This operation can be done so expeditiously that it takes practically no time, from the first incision to completion of the operation It would be much better for those who are not versed in the anatomy of this region to do a cholecystostomy instead of a cholecystectomy, as it would lessen the frequency of common duct obstruction Drainage is necessary Why subject a patient to a second operation if you can prevent this by putting in a small drainage tube for two or three days? The operation is done from below upward If you do the operation from above downward you get the main bleeding from the liver and it is annoying It will prolong the operation unnecessarily by attempting to eliminate that bleeding It is not necessary to cover the stumps of the cystic artery and duct The only reason the liver is sutured is to get the peritoneum in apposition to prevent adhesions I take issue with Dr Richter that these anomalies are by no means important They are of tremendous importance You have met with cases in which the hepatic or common duct has been destroyed If these variations are borne in mind, injury to the common and hepatic duct can be prevented Accidents are due to the fact that more of these anomalies are not borne in mind when the operation is done

STUDY OF NUTRITION AND MENTAL DEVELOPMENT IN CHILDHOOD

PRELIMINARY REPORT OF WORK DONE BY THE BOARD OF EDUCATION IN THE PUBLIC SCHOOLS OF CHICAGO

KATHARINE B RICH M D

Staff Physician Norwegian American Hospital, Chicago Visiting Physician St Francis Hospital Evanston Ill Examining Physician and Head of Nutritional Work Chicago Public Schools

EVANSTON, ILL

The increasing cost of living, sending more and more children aged 14 into the ranks of the workers, caused the Employment Certificate Bureau of the Chicago Public Schools, to which the children must apply for working certificates, to make the startling discovery that

1 Fifty-three per cent of the children of 14 applying for employment certificates were from 7 to 21 per cent below the average child of that age

2 These children, when they were employed, could not carry their normal amount of work

3 Because of this they lost their jobs, became discouraged and gravitated into becoming rolling stones, thus easily falling a prey to vicious and criminal companions

All of these children were undernourished Was this the cause and, if so, was it the only cause of their failures?

To determine this, the board of education, through the special interest of Dr Sadie Bay Adair, one of its members, resolved to carry out a number of experiments through the employment certificate bureau to ascertain the effect that direct nutritional work would have on preindustrial children in giving them the requisite bodily fitness for the labor they must perform

The program, as devised, included rest, proper food and direct instruction on health and nutrition so that the children might intelligently cooperate The question immediately arose as to the best methods Previously, nutritional methods used with undernourished children were based chiefly on the correct weight for the height, assuming that cases of underheight came strictly under the range of medical practice or were a matter of nationality The requirements of the employment certificate bureau, however, were such that the work of the board of education had to be based not only on the weight for age but also on the weight and height for age To meet the standard, the child of 14, in order to obtain a working certificate (with a few exceptions), must measure 57⅕ inches in height and weigh 80 pounds

The work was begun about eight months ago in the public schools in the face of many obstacles The attitude of the parents and the apathy of the children was no small factor in the way Questions of cost arose, and objections as to real benefits that would be obtained sprung up in the minds of those who had to bear the financial burden of the undertaking, for supplies had to be procured, cots and blankets for rest periods had to be purchased, milk had to be obtained, help had to be obtained, and the school proposition was doubly difficult because the help and the teaching had to be given first to the children Until parents understood the full significance of the work, they would not cooperate To become heartily in favor they must see some actual results and realize the *wage* value of the child's gain, for in the beginning the child is offered something he does not want, and the parents must be made to see the economic worth of the work to their own pocketbooks

For this reason, five public schools in both foreign and native localities were selected for the experimental work Some interesting and startling facts have been learned with regard to the comparative value of native and foreign diets This will be gone into more fully in our later statistical report of the year's work

room treated as a unit gained not only the normal weight for a definite period, but 64 per cent over Some children have gained 3½ pounds a week

One of the interesting points this work has brought out is that underweight previously was thought to result largely from bodily defects—diseased tonsils and teeth, adenoids, flatfoot, etc—and hence was strictly a medical question In this work, however, we have found that as the children gain in weight they appreciably gain in height without any medical care whatever Is this because metabolism is bettered, or can the preponderating factor be determined?

this way the parents' cooperation in any necessary procedure is ready and willing

It is to the child's best interest not to go to work, but to continue its schooling Undernourishment hinders its best mental effort The economic advantage from this point gained cannot be urged too strongly

The procedure so far tried out has three features

1 A chart has been prepared to meet the needs of both the public schools and the employment certificate bureau This is reproduced in another column It has been formulated in such a way that comparative gains both of height and weight are seen at a glance We believe that this is a distinct advance over methods previously used

2 Postals are sent to the parents each week letting them know the loss or gain in weight The interest this awakens and the friendly rivalry between mothers is shown by the fact that if the cards are not received they are promptly asked for

3 A certificate of graduation (filling the requirements of the employment certificate bureau) is given each child This is signed by the physician in charge the nutritional worker and the principal of the school It is presented with the other papers (birth certificate, etc) to the employment certificate bureau when the child applies for its working certificate This gives it a dignity at once and causes the document to be highly prized

Many children who intend going into high school want to work during the vacation period They cannot do it without a full working certificate It is required just the same as though they were going to work permanently It can be seen that results depend largely on the enthusiasm and loyalty of the nutrition workers We have been particularly fortunate in those we have had help us A knowledge of psychology is necessary also in handling various cases, as the approach must be made from a different angle as they develop One boy who had been especially hard to interest came bashfully up to the physician in charge and standing on one foot and twisting his cap in his hands said

Say dere s a guy over dere dat needs dis work bad He's 20 pounds underweight Can't you let him into de class?

Well you know we have room for only twenty in a class Now if you do your best take your exercises and do as we tell you, you can gain enough to get out of the way and make room for him Will you do it?

Thus stimulated, with a direct object to gain for a "pal," it wasn't long before a proud boy brought up his friend to gain the advantages he himself had obtained from the public school nutrition work

1924 Sherman Avenue

Health Supervision of the Schoolchild — Dr Taliaferro Clark speaking before the American Child Hygiene Association, Nov 11-13 1919 said that the number of cases of malnutrition the number of physical defects and the number of cases of feeblemindedness which are encountered in schools are an index of the thoroughness of the supervision exercised during the age periods previous to entrance into school His conception of school hygiene however is not primarily the detection and correction of remedial defects, but the placing of the normal child in an environment and under such supervision best suited to his complete physical and mental development Any program for school hygiene or health supervision of the schoolchild must take into consideration the physical surroundings of the child, and must place the child in the best possible sanitary environment during the course of its school life It must by reason of the incompleteness of the work done previous to school age provide for the seeking out and correction of the remediable defects which hamper the child and prevent it from taking full advantage of the educational opportunities, but in addition must include measures for preventing the occurrence of defects

CONGENITAL HYPERTROPHIC PYLORIC STENOSIS

REVIEW OF ONE HUNDRED AND SEVENTY-FIVE CASES IN WHICH THE FREDET-RAMMSTEDT OPERATION WAS PERFORMED *

WILLIAM A DOWNES, M D
NEW YORK

Before taking up the subject matter of this paper, I wish to call attention to an error that has crept into the literature involving the question of priority in the use of extramucous pyloroplasty The value of this procedure in the operative treatment of hypertrophic pyloric stenosis was first called to our notice at the Babies' Hospital in 1914, and very shortly afterward it was adopted as the routine operation in these cases Without properly verifying references we attributed the method to Rammstedt, as had been done by other surgeons The mistake was not realized until some years later, when Dr Alanson Weeks of San Francisco called my attention to it After a careful search of the literature, I find that Dr Weeks is correct, and that Fredet,[1] a French surgeon, deserves credit for the essential feature of the operation, that is, longitudinal incision of the serous and muscular coats of the pylorus, thereby liberating, but not opening, the mucous layer This surgeon then converted the longitudinal incision into a transverse one by suturing Two years later, in 1910, Weber[2] of Germany recommended the same procedure, calling it partial pyloroplasty, and stating that after he had performed this operation he found it had been previously employed by Fredet In 1912, Rammstedt[3] called attention to the advantages of Weber's procedure, but advised omission of the transverse suture and suggested leaving the pyloric wound gaping As this modification has been adopted by most surgeons using the extramucous or partial pyloroplastic operation, Rammstedt should receive credit for the suggestion, and the operation styled the Fredet-Rammstedt operation

All patients with hypertrophic pyloric stenosis on whom I have operated, according to the method just mentioned, from 1914 to January, 1920, are included in this report At the Babies' Hospital, 165 operations were performed, at St Luke's four, and the remainder in other hospitals There were thirty deaths in the series, giving a mortality of 17 1 per cent The results, judged purely from a statistical point of view, are disappointing, and yet a study of the records brings out the fact that the mortality in patients coming to operation in four weeks or less from the date of the onset of symptoms was only 8 per cent The rule of classing all deaths in the hospital following operation as operative deaths is strictly adhered to, even though several babies died from two to four weeks after operation, and had apparently made a satisfactory recovery If this rule was generally adopted in recording results, statistics would be of more value Eighteen babies died in collapse in from three to seventy-two hours It is only fair to state that all were in extremely poor condition, and that many of them could easily

have been classed as hopeless and operation refused, but as we felt that surgical intervention offered the only chance of recovery, they were given the benefit of the doubt

The average age of this group was nine weeks, with a history of symptoms for more than five weeks The weight averaged 6 pounds—a loss of more than 2 pounds each—amounting in several instances to more than one third of the body weight Postmortem examination was negative in every case Four deaths occurred in from ten to twenty-six days after operation In two instances necropsy disclosed acute gastroenteritis, but in the other two, findings were negative and for want of a better diagnosis they were called marasmus The remaining eight deaths were due to complications, and can be charged, with probably one exception, to bad technic or poor judgment Five of the eight died of general peritonitis in from eight to ten days Two of these deaths occurred early in the series in cases in which the operation was modified by passing a bougie through the pylorus by means of a small opening in the anterior wall of the stomach A third occurred in a case in which the duodenum was accidentally opened, although no evidence of leakage was found at necropsy In the remaining two, no explanation can be offered for the development of peritonitis other than faulty technic

In passing, it might be well to call attention to the fact that peritonitis was not suspected in at least two instances, as the symptoms were not classical, and for this reason one should be guarded in giving the cause of death after operation in infants as collapse, inanition, etc, unless proved by necropsy Hemorrhage was responsible for the death of three of the patients One died in twenty-six hours as a result of bleeding from the pyloric wound, one apparently a true hemophiliac, died on the third day of continuous oozing from the pylorus and abdominal wall, and in the third, with a history of symptoms for twelve weeks, death occurred on the third day following delayed hemorrhage from the abdominal wound While the amount of blood loss was small, no doubt this accident hastened the fatal termination In only one case was there evidence at necropsy to indicate that the operation was inadequate, so far as relieving the obstruction was concerned

The diagnosis of hypertrophic pyloric stenosis is based on the history and physical findings As vomiting, usually forcible in character, is the first sign that attracts attention to the disease, the onset should be considered as dating from the appearance of this symptom Loss of weight, more or less rapid according to the severity of the condition, immediately follows The size and character of the stools vary with the amount of food passed through the pylorus When the abdomen is inspected, visible peristaltic waves situated in the epigastric region and passing from left to right may be seen in practically every case

While waves of this character are observed occasionally in conditions other than hypertrophic pyloric stenosis, in only one of our proved cases of this disease was this physical sign lacking, and for that reason we consider it of great diagnostic value By gentle but deep palpation, the so-called tumor consisting of the hypertrophied circular muscle fibers of the pylorus may be felt to the right and above the umbilicus, or at times high up under the liver or even in the middle line just below the ensiform This tumor varies in size from the terminal phalanx of the little finger to that of the thumb, and gives an almost cartilaginous sensation to the finger even through the abdominal wall

Just before the abdomen is palpated, the stomach should be emptied of gas by the passing of a small catheter, and the abdominal muscles relaxed by allowing the baby to suck water from a bottle during the manipulation If these points are borne in mind, the hard, movable nodule at the pyloric end of the stomach can be felt with little difficulty in nearly every case Occasionally it may be necessary to give a few whiffs of ether or ethyl chlorid to secure satisfactory relaxation of the muscles

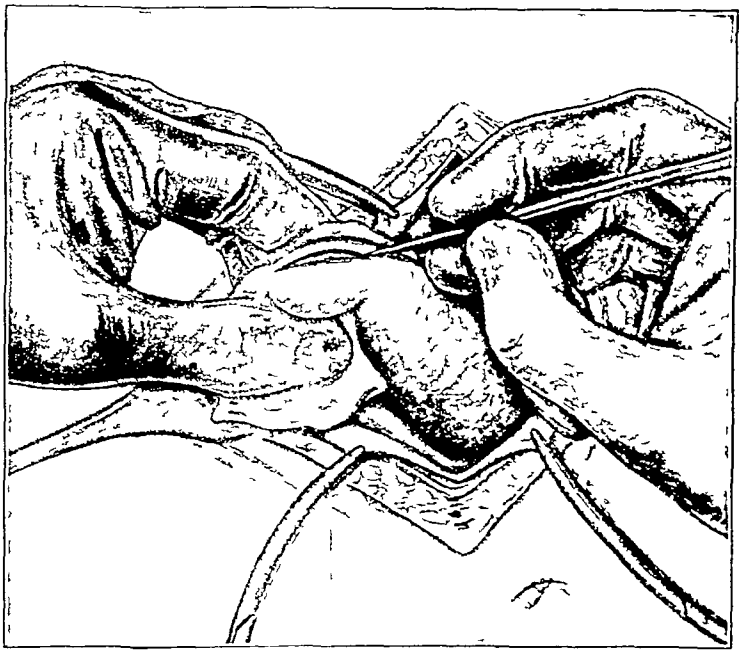

Fig 1.—Line of incision extending through serous coat and superficial fibers of circular muscle

The question of feeling the tumor in these cases has given rise to no end of discussion Undoubtedly, there is a certain knack to the procedure, but if the nodule is once felt distinctly, the chances of recognizing it increase in each succeeding patient examined In only two out of 217 cases (including thirty-one gastroenterostomies) which I observed and in which I operated up to April 1, has the anteoperative diagnosis of a tumor at the pylorus proved incorrect In one of these, a small freely movable right kidney was mistaken for a pyloric tumor, but in the other no satisfactory explanation could be given for the mistake Both occurred some years ago I myself believe that it is extremely important to develop the ability to feel the tumor in these cases, as its presence is conclusive evidence of the disease With this finding along with the usual symptoms of projectile vomiting loss of weight peristaltic waves gastric retention etc the diagnosis has been proved correct in over the 99 per cent of our cases and for th

thought it necessary to resort to the roentgen ray as a means of diagnosis in the average case of pyloric stenosis Many of these babies were admitted to the hospital in such poor condition that immediate operation seemed to offer the only means of saving life Certainly a delay of from four to eight hours or longer for fluoroscopy or roentgenograms was not warranted when the diagnosis could be established with almost absolute precision if the history was correctly taken and a proper physical examination made I know of at least one infant that went into a collapse and died while it was being put through a bismuth series We grant that an occasional vomiting baby is seen in which the history and findings are confusing, when the roentgen ray may be of inestimable value in clearing up the diagnosis

TREATMENT

As suggested by Holt,[4] congenital pyloric stenosis should be considered as occurring in mild and in severe forms The determination as to which of these groups a given case belongs depends on the patient's response to medical treatment If a patient is observed from the onset of symptoms, or if a reliable history can be obtained as to the duration of symptoms, medical treatment is justified for a period of from seven to ten days, provided the baby does not lose more than 20 per cent of its body weight during this time If, at the end of this period, the weight has become stationary and there is a general improvement in the other symptoms, this form of treatment may be continued, always bearing in mind, however, that even though the infant seems to be making satisfactory progress there may be a sudden relapse If so, the case should then be considered as surgical and operation advised If, on the other hand, there is no improvement under medical care, or if the improvement is unsatisfactory in that the baby is better one day and worse the next so that at the end of from a week to ten days the sum total is that the baby is worse, the case belongs to the severe group, and immediate operation is indicated

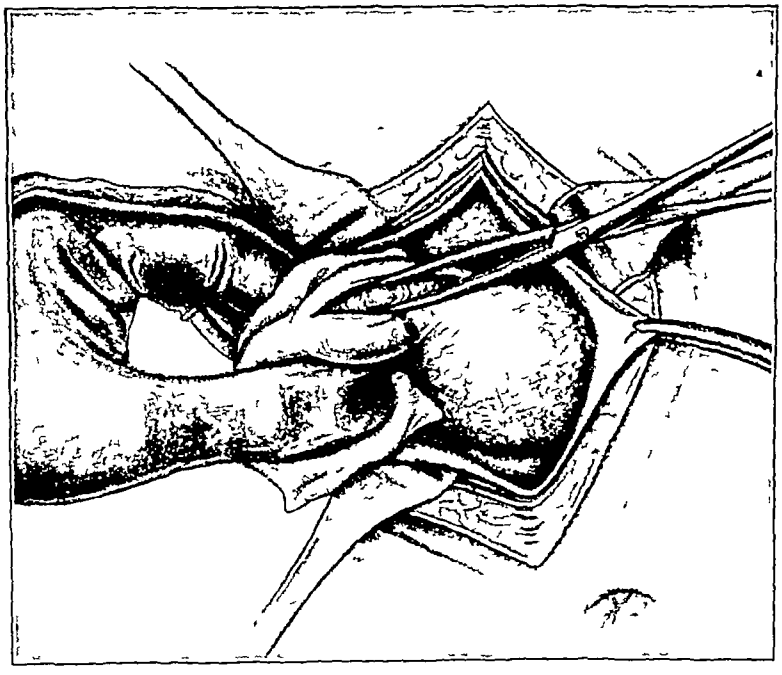

Fig 2—Incision spread with artery clamps mucosa beginning to appear between divided muscle fibers

Considerable experience in the treatment of this disease is necessary in order to acquire the ability to decide with any degree of accuracy in which group a given case should be placed As congenital pyloric stenosis is after all not a very common disease, there is little opportunity for the general practitioner to gain this experience For this reason, any baby with persistent forcible vomiting should be seen by the best available pediatrician at the first possible moment So frequently is the history misleading or inaccurate and the necessary data, such previous weight, lacking that I believe the question of operation should be taken up in every case as soon as the diagnosis is made

As has already been stated, those cases in which it is very evident that the symptoms are of short duration, and the condition of the baby good, observation under medical care is allowable for a short time, although the physician should be prepared to turn the case over to the surgeon should there be the slightest change for the worse Up to the last few years the results following operative treatment of pyloric obstruction in infants were so uncertain that physicians hesitated to recommend this form of treatment, but now that the technic is simplified and the results uniformly good, these objections no longer hold Surely no man could persist in the medical treatment of this condition beyond the point already mentioned as permissible when the mortality is stated by the best observers to be anywhere from 10 to 50 per cent or higher under this form of treatment, and it can be shown that the mortality after operation is a fraction under 2 per cent in selected cases In a study of the cases at the Babies' Hospital, Goldbloom and Spence[5] call attention to the fact that out of fifty-one breast fed babies coming to operation with a weight loss of less than 20 per cent, only one died Strauss[6] reports marvelous results following the operative treatment or hypertrophic stenosis in infants He states that he has operated on 103 unselected patients by a special type of extramucous pyloroplasty with only three deaths—a mortality of less than 3 per cent The diagnosis was made in each case by the fluoroscope, and in no instance was operation refused because of the poor condition of the baby From the increasing number of infants with pyloric stenosis admitted to the Babies' Hospital for operation each year, it would seem that the majority of pediatricians now believe that surgery offers more than medicine in the treatment of this disease

OPERATION

The abdomen is opened through an upper right rectus incision from 1½ to 2 inches in length When the wound is retracted, the stomach is easily recognized, and if the portion of the anterior wall which

4 Holt L E Medical Versus Surgical Treatment of Pyloric Stenosis in Infancy J A M A 62 2014 (June 27) 1914 Hypertrophic Stenosis in Infants ibid 68 1517 (May 26) 1917

5 Goldbloom Alton and Spence R C Prognosis in Operated Cases of Hypertrophic Stenosis of Pylorus Am J Dis Child 19 263 (April) 1920

6 Strauss A A Surgical Clinics of Chicago February 1920 p 93

appears is then picked up with anatomic forceps and gentle traction applied, the pyloric end of the stomach with the tumor is quickly brought into view The tumor is then grasped between the thumb and index finger, and a longitudinal incision varying from 1 to 1¼ inches in length, according to the size of the tumor, is made at about the junction of the upper and middle thirds (Fig 1) This incision should start just proximal to the duodenum and should involve only about one-half the estimated thickness of the muscular layer By gently spreading a pair of small, straight forceps inserted into the center of the incision, the undivided portion of the muscle tears exposing the mucous membrane (Fig 2), and by continuing this blunt dissection the division is carried down along the line of cleavage to the duodenal ring and well up on the stomach The separation of the muscular layer from the mucous layer should be sufficiently complete to permit the mucosa to protrude freely into the wound (Fig 3)

Great care should always be used in spreading the muscle at the duodenal end of the tumor, as the change from the thick-walled pylorus to the normal duodenum with its thin muscular layer is very sudden, and there is great danger of opening the mucous membrane at this point At the proximal end, the tumor gradually merges into the stomach, and there is not so much danger of injuring the mucous layer Complete division of the tumor with the knife should never be attempted As a rule there is little tendency to hemorrhage except in the older babies A small artery at the duodenal end of the incision may require a ligature, or, if this vessel has retracted under the muscular layer, it may be necessary to suture a bit of muscle fiber, easily obtained from the rectus, over the bleeding point (Fig 4) In the babies—aged 10 weeks and over—coming to operation, the tendency to bleed is much greater Besides the artery at the lower angle, there is generally another near the stomach end of the incision In these cases, continuous suture around the margin of the incision, supplemented by a bit of muscle or omentum, may be necessary to control the bleeding I do not believe that it is necessary to attempt to cover the exposed mucosa After the pylorus has been dropped back into the abdomen, the line of incision is again inspected to make sure that all bleeding points have been controlled The abdominal wall is closed in the usual way

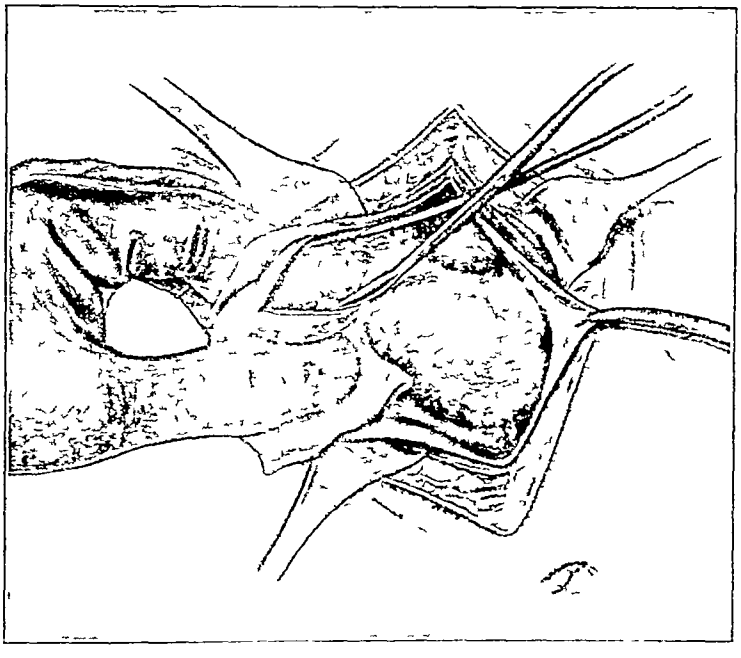

Fig 3.—Muco a protruding freely between cut edges of muscle operation completed

ACCIDENTS AND COMPLICATIONS

The duodenum was opened three times in this series of cases The opening was small in each instance, and was easily closed with fine silk suture reinforced by omentum Two of the patients made a satisfactory recovery, but the third died of peritonitis on the eighth day Careful hemostasis of the abdominal wound is very important Four of our patients lost considerable blood from this source, requiring transfusion in two instances As many of our patients were admitted to the hospital in desperate condition, it was the custom until recently to give a hypodermoclysis of from 150 to 200 c c of salt solution preliminary to operation We now feel that this was a mistake, and that the tendency to bleed was aggravated by this treatment, especially in the older infants Smaller quantities, from 50 to 100 c c of physiologic sodium chlorid or glucose solution given under the skin, beginning from two to four hours after operation and repeated as indicated, is just as efficacious and is a safer procedure Transfusion both before and after operation was resorted to in a number of cases, but did not prove of value except in those in which there had been hemorrhage, and in one case in which a deep seated abscess developed following a clysis Practically all the wounds healed by first intention Sutures are not to be removed before the tenth day Feeding is begun one hour after operation At first, from one to two teaspoonfuls of water, alternated with a similar amount of diluted breast milk, is given and gradually increased until the fifth day, when the child should be receiving almost its normal caloric requirements

The postoperative management of these patients as carried out at the Babies' Hospital was described by Morgan[7] in 1916, and more recently by Goldbloom and Spence Convalescence in the great majority was without special incident Loose stools were perhaps the most frequent complication, and were due either to increasing the food too rapidly or to changing from breast milk to a formula, as is often necessary preliminary to discharge from the hospital Postoperative vomiting is noted as occurring in small amounts or not at all in 107 cases, moderately in twenty-two, and in large amounts in sixteen Of the patients that died, eleven are recorded as having vomited and nineteen as not

The average stay in the hospital of the breast fed babies was fourteen days, and of the bottle fed babies twenty-three days Of the 145 babies discharged as cured, eighty-nine have been seen or heard from in the

7 Morgan F A The Postoperative Management of Pyloric Stenosis Am J Dis Child 11 245 (April) 1916

last two months All are in excellent health, and with few exceptions are above their normal weight Eleven are known to have died from one cause or another over periods varying from a few weeks to eighteen months after operation Forty-five have been lost sight of

We have been fortunate in obtaining necropsies in two cases in which the patient died of pulmonary conditions a year and a half after operation The pyloric tumor had entirely disappeared in both instances, and, with the exception of light omental adhesions at the site of the scar, the pylorus appeared normal in every way

CONCLUSIONS

1 If a satisfactory history can be obtained, and if the findings of a proper physical examination are correctly interpreted, the diagnosis of congenital hypertrophic pyloric stenosis should be made in practically every case

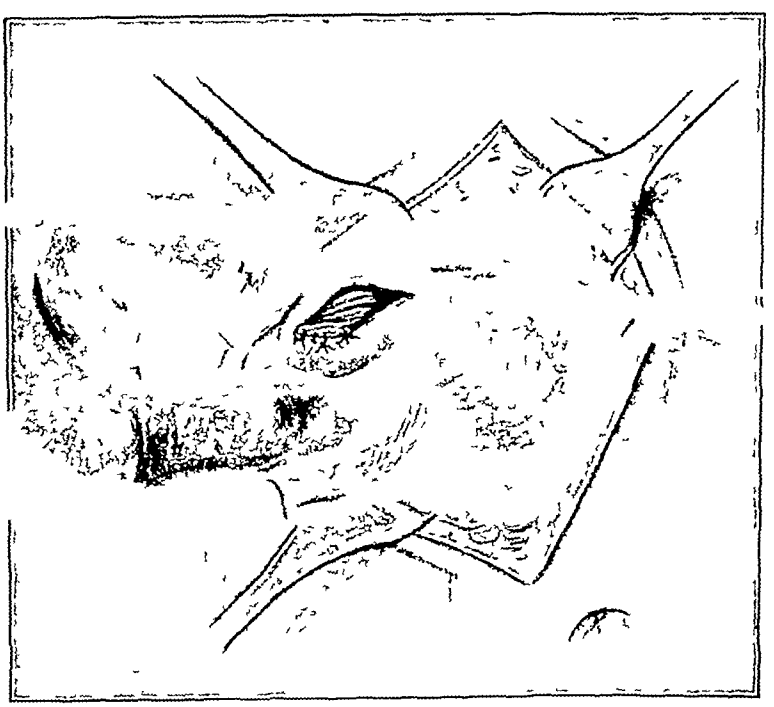

Fig 4.—Bit of muscle fiber used to control bleeding from pyloric artery

2 If the patient is observed from the onset of symptoms, medical treatment may be tried for a period of not longer than ten days, provided the weight loss does not exceed 20 per cent during this time If, at the end of this period, the child does not show definite improvement, operative interference is indicated Any patient, continued under medical care, and suffering a relapse should be operated on at once

3 All cases in which there is a history of a period of ten days or longer in which the data as to previous weight are lacking—and in which the patient is not in very good condition—should immediately be classed as surgical

4 The mortality among patients coming to operation within four weeks from the onset of symptoms is less than 8 per cent

5 The results following the Fredet-Rammstedt operation are permanent and the cure complete

424 Park Avenue.

ABSTRACT OF DISCUSSION

DR DEAN LEWIS, Chicago I have performed twelve gastro-enterostomies for the relief of congenital pyloric stenosis Three of the babies died In one case the gastro-enterostomy perforated, in another the abdominal wall opened on the fifth day, the baby dying from peritonitis, in the third case the baby did not recover, although no definite cause of death could be established All the patients who recovered had a stormy convalescence In the thirteenth case, the condition of the baby was so bad that I did not think it wise to perform a gastro-enterostomy and the operation under discussion was performed This baby recovered rapidly and without any untoward symptoms I have performed four of these operations since this first one The babies have recovered Two other cases in which I operated presented all the symptoms of congenital pyloric stenosis, with the exception of the tumor These patients were operated on but as no tumor was found the abdomen was closed Both babies recovered This operation is simple and can be performed quickly It meets the conditions and I cannot see how it can be improved on The incision should be made through the right rectus muscle and should be carefully closed in layers Opening of the incision has occurred not infrequently when it has been made in the linea alba

DR. ROLAND HILL, St Louis In 1,000 children born in a foundling hospital with which I am connected we found five cases of pyloric stenosis From the increasing number coming in for operation I cannot but believe that the condition has been very generally overlooked, and that physicians are just beginning to recognize it In regard to the method of operating Formerly I did a gastro-enterostomy The babies who were brought in early were in fairly good shape and recovered Then they began to bring in children practically dead and we lost quite a number I did fourteen of these operations One child, a premature baby, weighed 3 pounds 15 ounces I did a gastro-enterostomy The baby recovered and is well today, although seven years have elapsed I have done twenty-two Rammstedt operations Twenty-one patients recovered and one died This baby had suppression of urine for twenty-four hours before it was admitted to the hospital, with convulsions, and a temperature of 103 F This child never urinated after the operation and died of uremia We saved one very sick baby by injecting glucose into the superior longitudinal sinus We have found this to be of value in some of these very bad cases I have had to reopen the abdomen twice In one case it was due to not making the opening larger I made a single incision alongside of the first one and the child recovered In the second case the child had convulsions before being brought in, artificial respiration had to be resorted to before the operation, and still the wound looked fine at the end of the fourth day On the sixth day, while doing artificial respiration, the wound broke open, the child developed obstructive symptoms and we had to reopen the abdomen We found adhesions, released them and the child got well

DR A A STRAUSS, Chicago Too much credit cannot be given Dr Downes for calling attention to the Rammstedt operation Dr Downes brought out that there is a distinct field in the surgery of children and infants I have treated 163 cases of congenital pyloric stenosis, with three deaths I operated in 107, with three deaths The remaining fifty-six patients were treated medically I insist on a roentgen-ray and a fluoroscopic examination in every case Such examinations show definitely not only if there is a congenital pyloric stenosis, but also if the patient should be treated medically or surgically If from 70 to 80 per cent of the bismuth meal goes through within four hours, there will undoubtedly be recovery in that case by medical treatment, irrespective of any clinical symptoms or tumor If less than 70 per cent of

the bismuth goes through, it is an indication for operation A tumor was found in the 107 cases in which I operated The fifty-six babies treated medically recovered, and not a single one returned for operation

If the Rammstedt operation were performed as he described it, the mortality would range from 30 to 50 per cent The Rammstedt procedure does not release the obstruction sufficiently, and for this reason, the patient, following an operation, vomits from three to five days If he is in a moribund condition, this postoperative vomiting is sufficient to cause death The procedure which I devised is a reconstruction of the abnormal condition of the pylorus into a normal one It frees the infolding mucosa and releases the obstruction completely For this reason the moribund infant will not vomit, but will retain its food The mortality rate of my operation is less than 3 per cent I know of one surgeon who has operated in nineteen cases after my method without a death and another, who has operated in twenty-three cases, with one death

DR L T LE WALD, New York I wish to emphasize the frequency of this condition in children and the value of the roentgen ray in diagnosis Of all the gastro-intestinal examinations I have made in the last ten years, I know of no condition in which the diagnosis is so definite.

DR. ARTHUR D BEVAN, Chicago I have been impressed by the importance of doing all these operations under local anesthesia I would go so far as to say that congenital pyloric stenosis should under no circumstances be done under a general anesthetic. The Rammstedt operation is so much easier, so much safer that it has revolutionized the whole subject Whenever the choice lies between ether anesthesia and a gastro-enterostomy and local anesthesia and the Rammstedt operation, one should not hesitate to choose the latter I would like to put myself on record as saying to the surgeons of the country that under no circumstances should a case of congenital pyloric stenosis be operated under a general anesthetic It can be done better and with absolute safety under local anesthesia

DR. J L RANSOHOFF, Cincinnati The Rammstedt operation has the appeal of complete simplicity and absolute efficiency It is to my mind one of the most perfect operations devised in surgery and all modifications are unnecessary I did the gastro-enterostomy before the Rammstedt operation and several Rammstedt operations since I had one death This was due to the opening of the duodenum, a very unpleasant complication I should like Dr Downes to tell us his exact maneuver in closing these wounds of the duodenum I had the opportunity of making a postmortem examination of a child six months after a successful Rammstedt operation This child died suddenly of enlarged thymus The necropsy revealed a perfect pylorus without a trace of tumor There was a linear scar at the site of the old incision, no adhesions and the scar was completely covered with peritoneum Subsequently, in another case where I had done a Rammstedt operation, the mother heard of the result in the case of the child that died of enlarged thymus and became very much alarmed She brought the child to me and a roentgenogram showed an enlarged thymus Dr Palmer, of Cincinnati, among twenty cases has found five cases of enlarged thymus

DR. W A DOWNES, New York I do not subscribe to the views expressed by Dr Bevan regarding the use of local anesthesia in these cases I have tried it in various cases without very satisfactory results It is important not to allow the stomach to extrude and not to let the intestine to come out into the wound, and with a child struggling and crying, as it would with local anesthesia, I do not see how this could be prevented I always use ether, never chloroform I cannot make a statement regarding the frequency of enlarged thymus in these cases

Confidence in the Physician—One of the chief efforts of the physician is to establish a feeling of confidence in the patient and in the family and to relieve anxiety The success of this effort depends largely on personality but consciousness of real knowledge is a most important factor contributing to such an inspiring personal relationship—*Rufus Cole, Science* April 2, 1920

HYPERTROPHIC PULMONARY OSTEO-ARTHROPATHY FOLLOWING LUNG ABSCESS

FURTHER NOTES ON A PREVIOUSLY REPORTED CASE *

ETHAN FLAGG BUTLER M D
Major M C U S Army
NEW YORK

The more important points in the history of this patient prior to his transfer from the base hospital at Fort Sam Houston, Texas, to the Walter Reed General Hospital, as given a year ago by Erdman,[1] were

B M W., aged 24, a first lieutenant, Flying Detachment Air Service presented a negative family history except for glycosuria in the father The past history was negative There was no venereal history At the time of his commission in the army, the patient was a student at the University of Pennsylvania and had shown average ability as a student There had been no respiratory tract infection prior to the present illness The patient had tonsillitis in December, 1917 Tonsillectomy under general anesthesia was performed in January, 1918 Within a few days he developed a 'cough and later 'pleurisy," and was on sick report for about two months In May, 1918, he reported at Kelly Field, for instruction in aviation May 29 1918, he crashed from 700 feet and was badly bruised and shaken up but no fractures resulted, and he was in the hospital only three or four days However, his cough returned, and he was given sick leave During this leave he first noticed a change in the contour of the extremities—a painless swelling first of the knee joints and later of all the joints of the extremities and particularly of the hands and feet In August 1918, the patient was admitted to the hospital for observation The following month a lung abscess was diagnosed and drained by a two-stage operation The abscess was in the lower left lobe A culture showed the presence of *Staphylococcus albus* and a typhosus-like bacillus On account of the situation of the abscess surgical solution of chlorinated soda could not be used Vaccines were prepared but their use was followed by no demonstrable benefit Following drainage there was slight improvement in the condition of the extremities, but if for any reason free drainage was interrupted there was an increase in the swelling and more pronounced discomfort

Fig 1—General appearance of patient five months after operation (to be compared with corresponding picture in Erdman's original report)

Insomnia and irritability had been present for some time but not until November 1918 following the armistice did pronounced mental symptoms appear The patient himself has attributed them to disappointment in failing to go overseas and to the realization that the war had come to an end and

* From the Surgical Service of the Walter Reed General Hospital Washington D C

1 Erdman Seward Hypertrophic Pulmonary Osteo-Arthropathy (Bamberger Marie Dilaeve) J A M A 73 259 (July 26) 1919

that all he had to show for his service was a "wound in the side from which corruption poured" At all events, he became much depressed, introspective and apparently on the verge of a psychosis

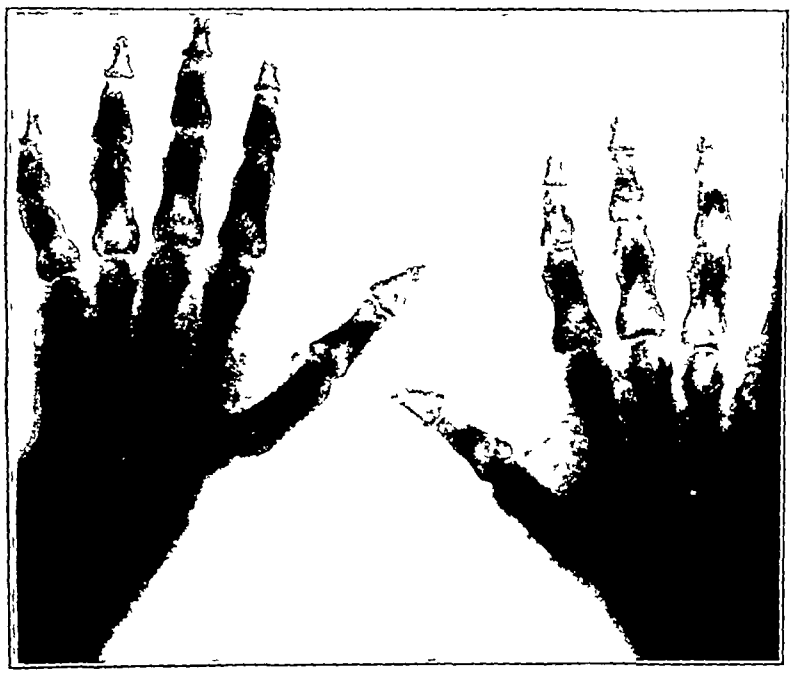

Fig 2 —Hands at time of admission

Erdman thus summarized the course, up to the time of transfer

Summary—There was an involvement of the left lung, probably the effect of an aspiration infection following tonsillectomy under ether There was a chronic productive cough There was a rapid enlargement of the feet and hands during a period of six months A lung abscess was drained, September 1918, with a resulting persistent bronchial fistula Mental depression and insomnia were present There was a slight loss of weight There was no evidence of syphilis or tuberculosis The pathologic condition in the enlarged hands and feet and other regions is best revealed by the roentgenograms, which show, besides the enlargement of the overlying soft parts, a definite striated production of new bone in the periosteum of the shafts of the metacarpals and the first two rows of the phalanges, also along the lower ends of the radius and ulna The corresponding bones of the lower end of the femur, also the clavicles and some of the ribs are to a degree affected The joint surfaces appear unaffected There is fluid in the knee joints

Negative Findings—The fingers are not "clubbed" No pituitary or thyroid changes are present There are no headaches, disturbance of vision nor drowsiness, on the contrary, very marked insomnia There are no changes in face, lips or skull There is no evidence of abnormal thirst or hunger, and there are no alterations in the special senses

FURTHER COURSE

At the time of his admission to the Walter Reed General Hospital, March 28, 1919, the patient presented the following picture

There was a bronchial fistula in the left posterior chest wall, opening through a sinus of 4 or 5 mm diameter, at the level of the eighth rib This sinus tract was 9 cm long, and at the bottom it was possible to see, by endoscope, a defect in a bronchial wall This was an opening of 2 or 3 mm diameter, apparently the only such opening A hemolytic strain of staphylococcus was obtained by culture, but the intensity of the infection was so slight that but one organism could be found in ten microscopic fields by direct smear

The patient also presented a symmetrical enlargement of the extremities, as has been adequately described in the original report by Erdman It should again be emphasized that this enlargement was not limited to the distal phalanges, as in the typical "clubbed fingers" so often found in these cases, but involved the whole hand and foot, as well as distal halves of the forearm and legs Furthermore, the enlargement was not similar to the changes noted in acromegaly, in that the length of the members was not increased, but only the circumferential measurement At no time during his stay at Walter Reed did the patient show any fluid in any joint cavity That had apparently disappeared completely, following the original drainage of the lung abscess There was diminution in the strength of muscles of the extremities There was restriction of motion in all the joints There was difficulty in performing fine movements, not on account of any loss of nerve function, for none such was demonstrable, but on account of the unwieldy members themselves The gait was waddling, he required assistance in dressing

Roentgen-ray examination showed the bony changes to consist of marked irregular periosteal proliferation, apparently limited to the diaphyses, and an osteoporosis, which may have been either a disuse atrophy or a pathologic process primarily The joint surfaces were not involved There was no evidence of pathologic change in the epiphyseal lines Limitation of joint motion was due to changes in the shafts of the bones, rather than to changes in the joints themselves There was a brawny infiltration of the soft tissues

Mentally, the patient seemed to be on the verge of a psychosis He appeared unable to obtain sufficient rest. He was depressed, irritable and introspective There were no definite delusions, and no hallucinations He required close watching to prevent him from performing such pranks as one might reasonably expect from a mischievous boy of 6 or 7 There was no attempt at injury to himself or others

The mental condition required the first consideration Rest, reassurance, and the diversions of occupational therapy gradually produced a marked improvement in that element of his syndrome Throughout this period he also received treatment in the department of physiotherapy for the osteo-arthropathic condition Such treatment included, at various times, massage, baking, diathermy, whirlpool baths and hot cabinet baths On account of the irritability and restlessness of the patient, frequent changes had to be made in this course of treatment There was slight improvement in his general well being but no demonstrable change in the bony parts, so long as the fistula remained open

Fig 3 —Final appearance of right hand

In May, 1919, it was possible to attempt a closure of the bronchial fistula Fulguration of the entire tract by high frequency sparks was done in the hope that complete destruction of any epithelial lining and subsequent cicatrization would obliterate the

fistula Three such attempts were made without inconvenience to the patient The net result was to decrease the caliber of the tract, but the fistula remained

Fig 4—Chest during attack of influenza in January 1920 showing involvement on the right side

August 19, Lieut-Col Carl Eggers and I closed the fistula by operation Approach to the chest wall was by a posterior linear incision at the level of and parallel to the ninth rib The fibers of the latissimus dorsi were cut transversely, and the chest wall proper exposed The sinus tract was naturally excluded in this incision Subperiosteally from 5 to 10 cm of the eighth, ninth and tenth ribs were resected, and then the remaining structures of the chest wall, intercostal muscles, nerves and vessels, as well as the periosteal sheathes, were removed *en masse*, the fistulous tract, so much of it as lay in the chest wall, coming away with this mass The old adhesions still held the lung to the chest wall These were gently loosened at the edge of the defect, care being taken, however not to reach the general pleural cavity, but merely to give the lung slightly more mobility than it formerly had had The dense scar tissue surrounding the fistulous tract at its point of entry into the lung was dissected free, allowing collapse of the mouth of the fistula, and then this mouth was touched with the actual cautery lightly The wound was closed by suturing the divided latissimus over the chest wall defect, and tightly closing the skin except for one rubber tissue drain leading down to the lung surface at a point remote from the fistulous opening The entire operation was performed under local anesthesia (1 per cent procain) and was well borne by the patient

Recovery was rapid and uneventful In two days, all drainage was removed There was a slight serous discharge for a few days, otherwise primary healing of the wound was uninterrupted All dressings were discarded at the end of three weeks

From that time the wound has remained healed there has been no cough and no sputum, and repeated physical and roentgen-ray examinations have failed to reveal any intrapulmonary trouble It is of special interest to note that in January, 1920, while the patient was still under observation, he developed influenza and an extremely light bronchopneumonia, which involved only the right lower lobe, leaving the left side of the chest, the side of the previous trouble, entirely free

Examination made in February, 1920, prior to the discharge of the patient, revealed slight asymmetry of the chest, the left side being smaller than the right, slight diminution in the expansion of the left side, the presence of a linear scar, firmly healed on the posterior chest wall, at the level of the ninth rib vocal fremitus well transmitted over the right, but diminished over the entire left, percussion note resonant over the entire right and the left front, but slightly impaired over the left back and axilla, marked dulness commencing 2 cm below the inner end of the scar and 1 cm below the outer end of the scar breath sounds normal over the right but expiration slightly prolonged over the left front and axilla, distant over the left back, except for the area of the defect in the chest wall where they were near and intensified, and in quality suggesting amphoric breathing, without being frankly so, voice sounds loudly transmitted over the area of the defect, and higher pitched on the left than on the right, whispered sounds very loudly and plainly transmitted over the area of the defect elsewhere there being no change between the left and right sides

Fig 5—Final appearance of left elbow

Fig 6—Final appearance of left foot.

Roentgen-ray examination of the chest detected nothing of significance on the right On the left there was slight pleural thickening at the level of the fourth to the seventh rib, axillary region, the diaphragm line was smooth, the costophrenic angle was more shallow than on the opposite side

Immediately after the closure of the bronchial fistula there was noticeable improvement in the osteo-arthopathic condition Resorption of the periosteal proliferation commenced first, and most marked, in the phalanges, later, and less marked, in the long bones of the extremities At the same time there was an increased deposit of lime salts throughout the shafts of the bones, and the old picture of osteoporosis was no longer as marked, in the roentgenograms Soft tissue infiltration disappeared concurrently with the improvement in the bony condition The range of motion at the joints increased Throughout this period the patient continued to receive the benefits of active treatment in the department of physiotherapy, but also he undertook many more outdoor activities and indulged in normal exercise The improvement in the bone cortex and in the soft parts was probably influenced greatly by the latter factor

Mentally there was also marked improvement With the freedom from dressing attention, he became more cheerful With the improvement in the condition of the extremities he developed more self-confidence However, there remained periods of depression, and he continued to be introspective and apprehensive lest other misfortunes might befall him

COMMENT

It is fair to consider that the general outlook for this patient is good No further trouble should be anticipated from the old lung abscess The influenza in January, 1920, was a severe test There will probably be always a residual chronic periostitis Eventually complete recovery from all neurotic symptoms should take place

The case is of particular interest in reference to the improvement in the osteo-arthropathic condition that followed the elimination of the focus of infection in the lung It may serve as a plea for early definitive surgical action in similar cases

345 West Fiftieth Street

ACCESSORY SINUS DISEASE AND CHOKED DISK*

HARVEY CUSHING, M D
BOSTON

A number of papers have recently appeared in our journals on the relation of visual disturbances to inflammation of the ethmoidal and sphenoidal cells The matter has finally come to the attention of the general profession as well as to those whose chief interests lie in the province of rhinology So many unhappy consequences of indiscriminate and ill-advised operations on the accessory sinuses have come to our attention in this clinic that I feel more or less obligated to express an opinion on the matter If harm, as I believe, is actually being done to patients by lack of understanding of these conditions, unless we set ourselves straight concerning them harm will certainly come to surgical rhinology, and this we all wish to avoid

There can be no doubt but that suppurative inflammations of the ethmoid or of the sphenoidal cells may in certain cases lead to inflammatory changes of adjacent nerves We are sufficiently familiar with this in the case of the neuralgias which accompany suppurative infections of the frontal or maxillary sinuses Much has been written, too, in regard to similar extensions of infective processes to Meckel's ganglion, producing the so-called nasal neuralgia, regarding the prevalence of which, however, I have ventured to express doubts However, it is perfectly conceivable that suppurative processes in the ethmoid cells adjacent to the optic foramina may set up similar disturbances in the optic nerves But what is inconceivable is that these processes should produce choked disk

It is important to bear in mind that what by common usage is referred to as choked disk (Stauungspapilla, papilledema) is a condition brought about by mechanical causes, and that optic neuritis, papillitis and other similar terms are misnomers for this condition Inflammatory processes may affect the optic nerve in such a way as to produce reddening, injection and possibly such a degree of hyperemia and vascularity of the nerve head as to resemble the early hyperemic stage of a choked disk, but it is unbelievable that an infection of the accessory nasal sinuses in the absence of increased intracranial tension should produce an actual choked disk On the part of the rhinologists, the statements which accompany their papers are extraordinarily unconvincing I may give a few quotations from a recent number of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION

> Its pathology [hyperplasia] has always seemed to me rather obscure Many specimens have been sent to the laboratory but nothing of interest has been discovered I had high hopes of getting some valuable information but the report as usual was negative
>
> It would probably be difficult to find an adult individual in a temperate climate who does not present an example of this bone change within his nasal chambers which I have a right to call pathologic It is only exceptionally that the symptoms to which it gives rise are sufficient to cause him to seek relief it is readily seen that many of these cases have a condition so elusive as to be difficult of detection, either microscopically or macroscopically In looking into these noses one is disappointed in not finding much, if anything, pathologic.
>
> It is always a disappointment to the ophthalmologist when pus cannot be found and the roentgenograms are negative It is difficult to convince some that there is such a thing as hyperplasia, but case after case has demonstrated that *pressure sufficient to cause atrophy of the nerve* [italics mine] can take place in a nose that on both inspection and roentgen-ray examinations showed practically nothing abnormal
>
> While it is a source of satisfaction to operate on patients with a marked nasal pathologic condition, nevertheless one should realize that unless some definite explanation for the loss of vision can be found elsewhere, its most probable origin is in the sinuses The diagnosis of accessory sinus disease in cases of practically negative nasal findings is largely made by exclusion
>
> It is well known that cases of blindness from accessory sinus disease recover spontaneously Four of my patients have told of previous attacks in which the eyes were blurry for two or three days and the vision defective, but from which they recovered without treatment
>
> Thus the demand for early operative interference in the cases of total loss of vision is much more imperative than when the loss is but partial It would seem the wiser course here to err on the side of advising operation too soon and possibly unnecessarily than to risk a patient becoming permanently blind through delay

It may be unfair to take random paragraphs from a well-intentioned paper, but I cannot conceive of a feebler argument on which to base the widespread advocacy of so serious an operative procedure as

* From the Peter Bent Brigham Hospital

one in the upper nasal region That these operations must be frequently performed I am led to believe by the articles I have seen That they frequently meet with disaster in the hands of the inexpert I am convinced by the fact that I am often urged to see patients in consultation who are in extremis from meningitis following what was supposed to be a trifling intranasal operation

Now I may say further, in connection with these papers, that there is great confusion (1) in citations from the literature, many of which antedate our knowledge of the mechanical factors producing optic atrophy and choked disk, (2) in the variety of lesions considered which vary from the obscure hyperplasia mentioned above to actual suppurative process or even sphenoidal tumors, (3) in that these intranasal procedures of exenteration of the ethmoid cells, removal of the middle turbinate, or opening of the sphenoidal cells are supposed to relieve or forestall a great variety of processes variously described as retrobulbar neuritis, neuroretinitis, optic neuritis, papillitis and optic atrophy

I confess to a lack of understanding of the causation of certain types of amaurosis which are often attributed to retrobulbar neuritis, but there are so many well recognized neurologic lesions that many produce conditions indistinguishable from them that I have some misgivings when the former diagnosis has to be made These things, however, are out of my province But when a retrobulbar neuritis is said to be accompanied by 2 or 3 diopters of swelling we are certainly dealing with something which a hyperplasia of the mucous membrane lining the accessory sinuses is not capable of producing During the course of the last twelve months many patients with brain tumor have appeared in the Brigham Hospital clinic who had recently undergone radical intranasal operations for assumed infections of sinuses Were the operations done merely on the chance that the patient complained of obscure headaches or visual disturbance in the absence of choked disk, it would be understandable, but when these operations are performed on people with full-blown changes in the optic nerves and with an idea that cleaning out the ethmoid and sphenoidal regions might check the process, we have certainly gone too far

Fig 1—Rear view of the skeleton of a foot resting on a mirror to show the arc of the under surface of the os calcis and its small bearing area

Early Diagnosis of Tuberculosis—Visualization by the roentgen ray probably gives us a clearer idea of the character and extent of lesions in the lung than any other single method of examination except postmortem examination It is not particularly desirable however, nor is it conducive to good work in diagnosis to limit ourselves to one method of examination The isolation of the roentgenologist in his laboratory is no more to be justified than would be limiting one examiner to auscultation and another to percussion It is only by the most careful correlation of the results of the physical roentgen and laboratory findings, with the history and temperature record that we can hope to attain the maximum efficiency in early correct diagnosis—A W Erskine, *J Iowa State M S* April 1920

PREVENTION AND TREATMENT OF WEAKFOOT IN CHILDREN

PERCY WILLARD ROBERTS, M D
NEW YORK

About five years ago I called attention to a fundamental principle concerning the production and correction of weakfoot which had not been previously recognized It was demonstrated at that time that rotation of the os calcis on its anteroposterior axis controls the degree of strain which the longitudinal arch is called on to bear, and that by directing the course of such rotation outward, foot strain may be prevented and weakfoot overcome During the interval that has elapsed, the theory has been put to extensive clinical tests which have proved its soundness and made clear its value in preventive work when applied to children's feet

The old adage, "as the twig is bent the tree is inclined," aptly applies to the child's foot If through mechanical support and muscle training its balance is maintained through the period of growth, there will result a normal foot, architecturally correct and muscularly strong enough to meet all the demands that may be made on it in the years to come As foot troubles in adult life have their origin many times in improper development of the pedal tissues in early childhood, it is evident that the subject under discussion is one deserving of more consideration than it usually receives

At the end of the first year of life, when the baby begins to stand, the bones of the feet are hardly more than an orderly arrangement of cartilaginous masses Centers of ossification are present in the astragalus, os calcis and cuboid at this time, but they do not appear in the other bones of the tarsus until from one to three years later It will be apparent, therefore, that these structures are in a condition to be profoundly influenced by the stress and pressure that may be brought to bear on them They will grow into perfect or imperfect bones as circumstances may ordain, hence the wisdom of experienced supervision of the child's foot throughout this important period of development

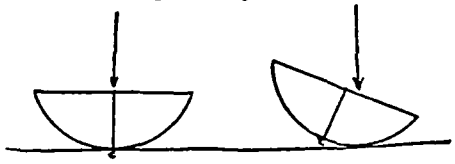

Fig 2—Diagram illustrating the cause of rotation of the os calcis in weakfoot When the thrust of the body weight comes over the center of balance the bone remains upright Slight deviation of the point of thrust produces tilting

There are three factors commonly at work to disturb the fulfilment of Nature's plan for the formation of the foot, namely, improperly designed shoes, unequally developed leg muscles, and a deviation in the normal mechanical relations between the tarsus and the leg The importance of the last of these will be apparent on examination of the simple basic principles underlying the attitude of pronation As will be seen by referring to Figure 1, the bottom of the os calcis is approximately an arc, and the weight of the body is resting on a single point, representing the center of balance of this bone So long as the thrust of the body weight is carried directly over the center of balance, the bone will not tilt, but if it is shifted let us say to the medial side the bone will rotate inward (Fig 2)

The ligaments on the bottom of the foot bind the os calcis and the bones anterior to it so firmly together that they must move as one mass Therefore inward tilting of the heel bone will lower the inner border of

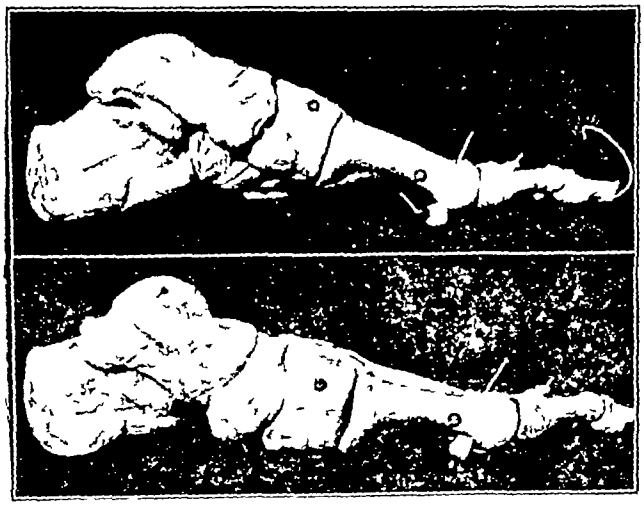

Fig 3—Above normal position of tarsal bones below depression of the arch by rotation of the os calcis on its long axis

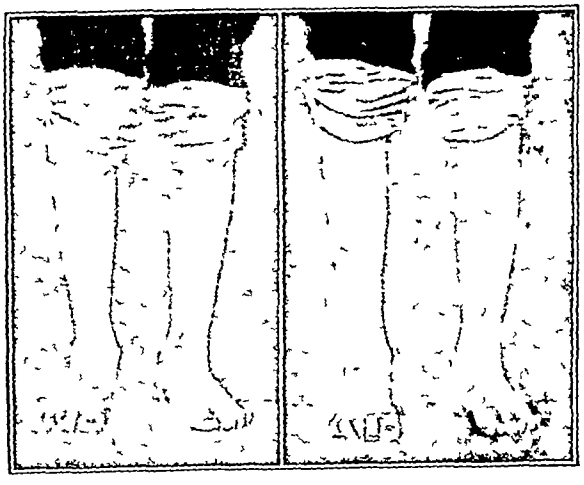

Fig 4—Left moderate weakfoot right correction of inward bulging of the internal border of the right foot by rotation of the os calcis

the foot, as shown in Figures 3 and 4, and pronation becomes an established fact with the consequent evil of strain on the ligaments of the longitudinal arch The result of long-continued strain of this nature will ordinarily be stretching of these ligaments and the production of weakfoot The prevention of this fault in attitude is easily possible if the young foot is properly trained Perhaps the most important single factor in the development of a normal arch is the maintenance of the upright position of the os calcis during the period of growth In some cases it is necessary only to raise the inner border of the heel of the shoe to insure this result In others, some firm mechanical appliance capable of grasping the heel, such as the plate to be described later, will be indicated *It is the* custom of the day, when a child has weakfoot, to put in the shoe a plate which presses up the arch In the light of my experience this would seem to be both physiologically and mechanically wrong—physiologically wrong because constant pressure on the plantar tissues interferes with their development, and mechanically improper because the force is inefficiently applied The desired correction can be much more readily obtained by an apparatus whose effective force is applied directly to the heel, and the permanence of the results will be more certain

Much can be done toward maintaining the proper alinement of the bones of the foot by muscle training, but the use of this measure must of course be deferred until such time as the child is old enough to cooperate intelligently, therefore the question of shoes takes second place in any reasonable scheme of prophylactic supervision of foot growth While it may be profitless to discuss the relationship between present day foot troubles and the civilized custom of shoe wearing, it must be admitted that if the foot of the savage is normal, then our own are anatomically distorted, and the natural inference is that shoes are responsible This is very likely true, for we have seen that the bones of the infant foot are soft structures readily influenced by continuous compression, and we know that long before the baby has any inclination to stand, his feet are encased in leather coverings which, in the nature of things, must affect their development From that time onward the foot, when in use, is always subject to the restriction of movement imposed on it by a shoe To avoid undue distortion it is necessary, therefore, to select children's footwear with an intelligent understanding of the needs of the growing foot.

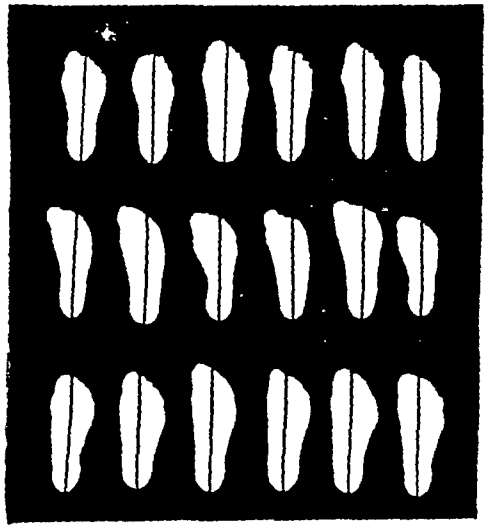

Fig 5—The three types of normal feet described by the American Posture League upper row, straight feet middle row inflared feet, lower row outflared feet

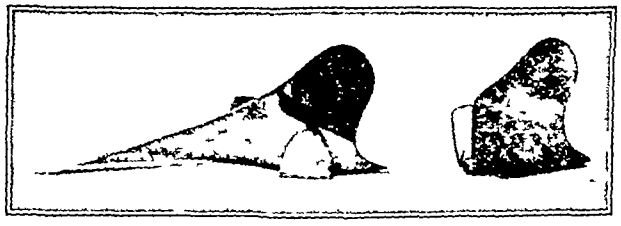

Fig 6—Roberts plates The small plate which was used with success in about fifty cases and proved the theory of arch control by rotation of the os calcis extends forward only to the anterior border of the os calcis

During the first ten or twelve years of life, the foot should have ample room to expand laterally as well as to grow in length To meet this condition, a proper shoe may be described as one which is sufficiently wide

at the ball of the foot to avoid crowding the heads of the metatarsals together when the wearer is standing, and in which the inner and outer borders of the sole maintain a straight line well beyond the great and little toes The popular idea that the anterior part of a shoe should swing inward, a design so often seen in so-called "orthopedic" lasts, is based on an entirely erroneous conception of the normal foot This fact seems proved by an investigation carried on by one of the technical committees of the American Posture League which collected about two thousand tracings of normal feet from various parts of this country, Japan and India, among which were many outlines of feet that had never worn shoes Careful examination of these by means of a geometric scale revealed the fact that there exist three distinct types of feet (Fig 5) and not merely one, as we formerly supposed The first has been designated as a "straight foot," because a line bisecting the heel and extended forward divides the anterior part of the foot about evenly *The term* "inflared" has been applied to another type in which the anterior half of the foot appears to swing inward, conforming to the shape of the conventional orthopedic shoe In the third type, called "outflared," that part of the ball of the foot on the outer side of the bisecting line is much wider than that on the inner side Unfortunately, there is no record of a similar study of children's feet, and until scientific data are available we must be content to treat the child's foot on more general principles when it comes to the selection of shoes, bearing in mind that compression of either the outer or the inner borders of the feet is to be avoided

Fig 7—Left, severe flatfoot, right correction obtained by standing on the plates This correction is naturally much greater when the foot and the plate are held together by a shoe Note the effect on the Achilles tendon

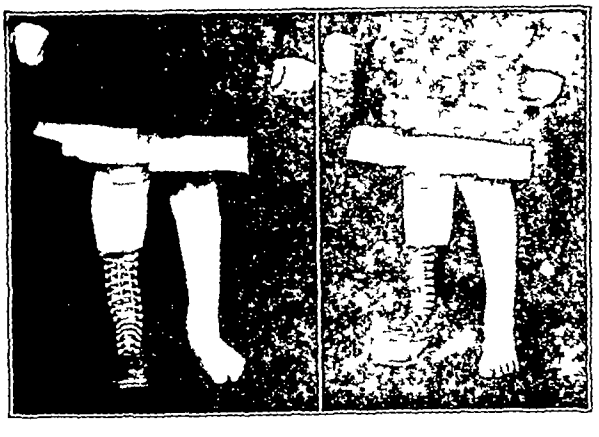

Fig 8—A case of paralytic valgus left standing without plate right standing on short heel plate

Although definite muscle training cannot be carried out effectively at an early age, something can be accomplished by teaching the child to walk on its toes and by devising simple games that will bring this attitude into play, thus helping to develop the strength of the anterior and posterior tibial muscles Later the much used exercise of rising on the toes and coming slowly down on the outer borders of the feet will be found helpful in attaining the same end, if it is persisted in over a considerable period of time

Maintenance of the upright position of the os calcis, or its rotation outward if there is an inclination to pronation, may be comfortably achieved by the plates illustrated in Figure 6 Their efficiency has been proved in many hundreds of cases in the last five years, and they have been found to possess a definitely curative value in the treatment of weakfoot in children Their function is to rotate the heel, and this is accomplished by tilting the floor of the plate under the calcaneum and by pressure of a thumblike flange which engages the tissues over the inner side of the bone toward its posterior extremity (Fig 7) In the first fifty cases treated, a short plate reaching forward only as far as the anterior

Fig 9—Rear view of casts in a severe case of flatfoot That on the right shows extreme bulging of the inner border of the right foot that on the left, the result of a year of treatment with Roberts plates

Fig 10—Two shoes worn by a child with [illegible] of two weeks wear without a plate 2 effect [illegible] four weeks [illegible] a plate

border of the os calcis was [illegible] the results that were obtained proved [illegible] foot strain can be relieved by [illegible] the calcaneum Later the [illegible]

include an extension to the ball of the foot, which cares for any weakness of the anterior arch and also gives the apparatus greater stability The corrected position in which the os calcis is held finally becomes the attitude of habit in the majority of cases and it is usually possible to omit the support in about two years and occasionally earlier Their effect is clearly shown in Figures 7, 8 and 9

One of the most striking demonstrations of the action of these plates is seen in cases of paralysis of the anterior tibial muscle which allows the foot to roll into the valgus position (Figs 8 and 10) Mild types of this deformity can be perfectly controlled by this device until the patient is old enough to undergo operation for a permanent correction Cases of this kind illustrate, too, the soundness of the theory that pronation of the foot can be overcome by outward rotation of the os calcis In a word, control of the calcaneum is the key to the correction of weakfoot, especially in children

Clinical Notes, Suggestions, and New Instruments

SOME NEW SPLINTS AND APPLIANCES*

CHARLES F CLAYTON, M D FORT WORTH, TEXAS

The appliances shown in the accompanying illustrations were developed during the reconstruction work at U S General Hospital No 29, Fort Snelling, Minn They are believed to possess advantages over appliances previously described in the literature, designed to meet the respective needs which furnished the incentive for their development A brief description of each one of them will suffice, with the

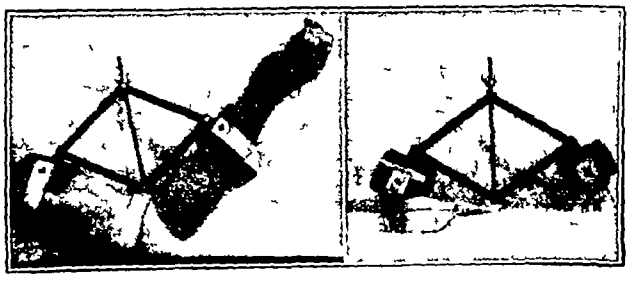

Fig 1—Extension splint for elbow

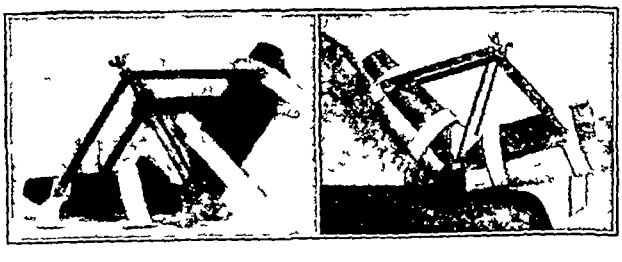

Fig 3—Reversible splint for elbow

illustrations, to make clear the underlying idea, and enable any one, with a few tools and a little material, to reproduce them for his own use

EXTENSION SPLINT FOR ELBOW

This splint (Figs 1 and 2) is an adaptation of the diamond splint idea Its special features are first, the narrow cuffs, attached to the bars of the diamond on swivels, thus insuring equal pressure throughout, and reducing thrust to a minimum, second, the elbow strap, passing through the slot in the metal which holds the center of the splint fast to the anterior surface of the joint, making it possible to force the

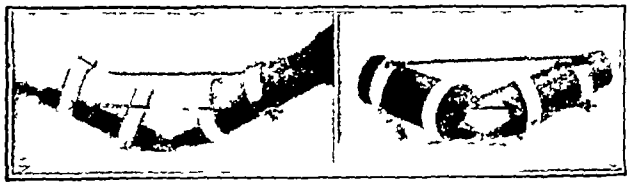

Fig 4—Reversible splint for elbow

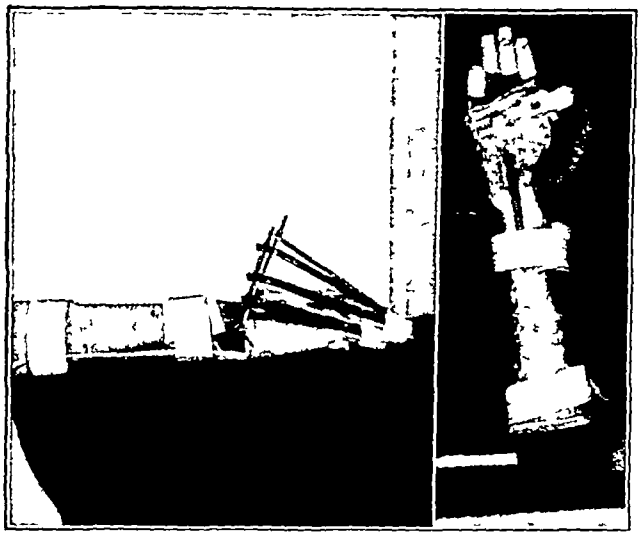

Fig 6—Extension splint for fingers

joint to complete extension, and, third, the threaded rod and winged nut, by means of which extension is accomplished The advantages of the splint are that it is light, comfortable, simple in construction, that it exerts pressure exactly where pressure is required, and that the pressure can be regulated perfectly to suit the requirements of the individual case An important feature of this splint, not shown in the illustrations, is a felt pad which should be used under each turn of the elbow strap, to prevent damage to the tissues by pressure

REVERSIBLE ELBOW SPLINT

This splint (Figs 3, 4 and 5) is modified from a plan submitted by Capt E A. Klein, Medical Corps, of Cincinnati The method of applying force by means of which flexion or extension is accomplished is exactly the same as in the extension splint, except that two threaded rods and nuts are used in each position with this splint It possesses the advantage over the foregoing of accomplishing both flexion and extension

As these splints are used, the ends of the threaded rods beyond the winged nuts should be bitten off with nippers from time to time, as flexion or extension progresses, thus rendering the appliance less cumbersome

EXTENSION SPLINT FOR FINGERS

Every surgeon has experienced the difficulty, with the means ordinarily at hand, of restoring function to fingers in contracture, the result of peripheral nerve injuries, or the involvement of tendons in cicatricial tissue The trophic disturbances which so often accompany this condition render splinting most difficult, because of the pressure necrosis which is so likely to follow attempts at mechanical reduction of the deformity The appliance, illustrated in Figures 6 and 7, was designed with the purpose in view of distributing pressure in such manner as to obviate this accident The results which have attended its use in a limited number

* Owing to lack of space the scale diagrams have been omitted They appear in the author s reprints

of cases have been most gratifying This appliance should be made to order for the individual case, as in no other way can the exact fit which is essential be obtained

It will be observed that the rod and winged nut method of applying force is employed here again The tremendous force which it is easily possible to exert by this means makes necessary here a word of caution Care should be exercised, lest too great pressure be exerted on the palmar surfaces of the fingers, this being the only point, when the appliance is properly fitted, at which direct pressure is applied It should not be attempted to force results too rapidly

ATTACHMENT FOR THOMAS LEG SPLINT

This attachment (Figs 8 and 9) was designed for use with positive bone traction, by means of calipers or tongs, but lends itself equally well, as shown in Figure 8, to use with surface traction by means of adhesive tape applied to the skin The advantages of this attachment are that by its use fractures of the femur can be treated with the knee flexed, and that the degree of flexion may be regulated at will Active or passive motion at the knee may even be employed, the slots in the disks at either side permitting a range of motion of about 75 degrees It will be observed that the method of fastening the attachment to the Thomas splint permits of adjustment to fit the length of any thigh Moreover, this feature causes the attachment, by sliding on the lateral rods of the splint, to adjust itself automatically, as extension progresses, to increasing lengths of the femur Provision is also made for adjustment in length of the leg piece, as shown in Figure 9 It will be seen that the attachment may be used with either a full length or shortened Thomas splint, and on each side Extension may be obtained by means of the Spanish windlass, rod and nut or pulley and weight

BANDAGE FOR ACROMIOCLAVICULAR DISLOCATION

This dressing (Fig 10) is thus applied A piece of felt one-half inch thick, 4 inches long and 3 inches wide is placed

Fig 8.—Attachment for Thomas leg splint

directly over the acromioclavicular articulation and the bandage applied beginning at the injured joint passing across the back to the axilla of the sound side across the front of the body, over the injured shoulder, down the back of the arm to the elbow, which is flexed to a right angle, and then up the front of the arm to the starting point Four or five complete turns are thus made, and the bandage is finished by making three or four turns around the arm as shown in Figure 10, to prevent the bandage from slipping on the forearm This dressing has the advantages of exerting pressure evenly over the dislocated joint, and of remaining in place indefinitely

It is essential to success in the use of these, as of all other mechanical appliances that they be applied with skill, and and that unrelenting vigilance attend their use This applies with especial emphasis to appliances by means of which

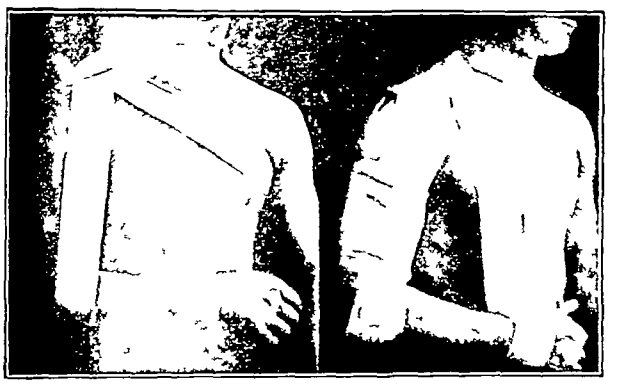

Fig 10.—Bandage for acromioclavicular dislocation

force is applied to produce motion in joints Moreover the appliances should not be used to the exclusion of other necessary measures

261 Burton Building

A NEW COMBINED BLOOD TRANSFUSION AND ASPIRATING MACHINE

MARTIN LEWIS JANES M D NEW YORK
Instructor of Orthopedic and Bone Graft Surgery New York Post Graduate Medical School and Hospital Pathologist Bellevue and Allied Hospitals Gouverneur Division

This apparatus has been used successfully at the Gouverneur Hospital for both blood transfusion and aspirating purposes The machine has for one of its objects the provision of a multiple cylinder pumping apparatus, two Luer syringes being converted into pumps, so constructed as to provide a continuous flow of blood from donor to recipient and rendering impossible accidental back-flow After repeated experimentation with the ball valve, in which balls of various metals and specific gravities were used, it was found to be unreliable because it was not leak-proof The balls do not always fall into position in their respective sockets to shut the valve completely, thus frequently causing leakage and back flow so that one is not certain whether the blood has come from donor or recipient or vice versa

Another object of the apparatus is to provide means for supporting and operating opposed pumping devices adjustable to cooperate with pumps (syringes) of different lengths and to vary the length of the stroke of the pump pistons The machine is so constructed that each pump cylinder, which is a 10 or 20 c c Luer syringe may be quickly and easily disconnected independently of the other cylinder and piston

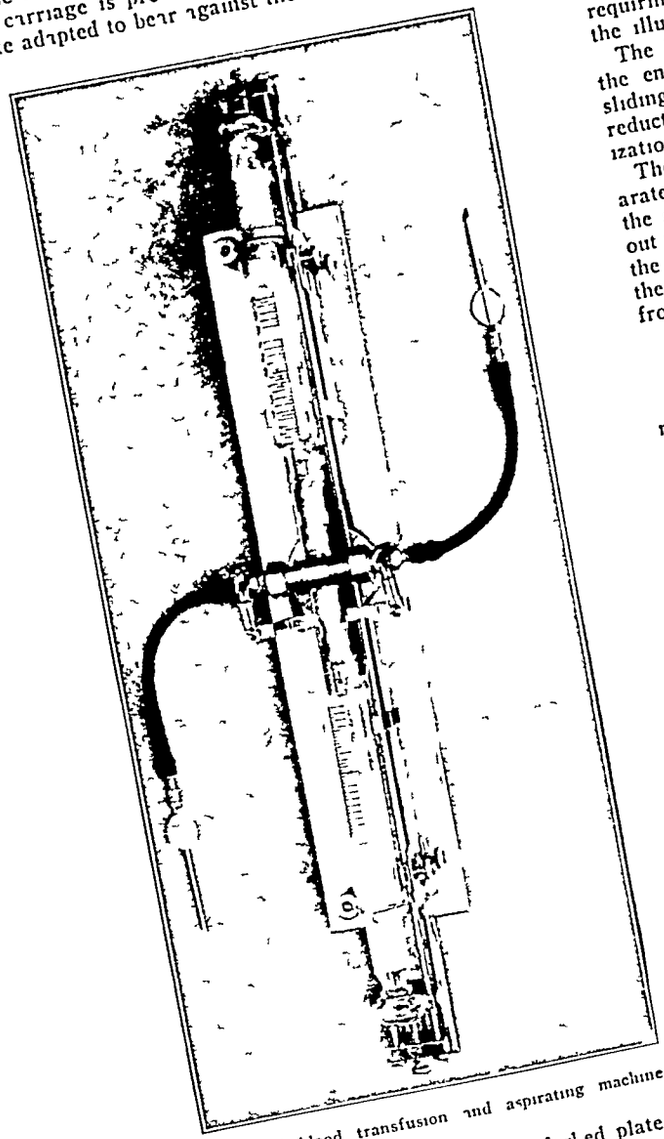
The machine consists of two oppositely faced Luer syringes which are supported on two pairs of saddles rigidly held to the base plate of the machine and in longitudinal alinement with it The syringes are removably held down in the saddles by adjustable and detachable clamps having hook portions engaging against the flanged outer ends of the syringe barrels the clamps being attached to each end-most saddle by means of clamp screws The syringes with their pistons can be quickly and easily detached from the apparatus by loosening these clamps which are held tight by means of thumb screws

The opposed plungers are connected by a reciprocable frame comprising side rods and end bars to cause the

* Presented before the Section of Surgery New York Academy of Medicine April 2 1920

plungers to move in unison in the same direction relatively to the base plate and thereby impart a suction stroke to one plunger during the discharge stroke of the other plunger To reduce friction to a minimum, each end of the frame has a carriage with a pair of rollers adapted to roll on the upper surface of the adjacent collapsible extension plate during the movement of the pistons The plungers or pistons of the syringes are removably connected at their outer ends with the carriage to move in unison with the frame and carriages, and to permit adjustment of the plungers relatively to each other and to the syringe barrels by adjusting the carriage along the frame

Each carriage is provided with a fixed, upwardly extending plate adapted to bear against the outer end of the plunger



Combined blood transfusion and aspirating machine

head, and with an upwardly extending forked plate or yoke adapted to embrace the neck of the piston and bear against the inner end of the plunger head The plunger is thus held to the carriage to move back and forth with it, but may be quickly disconnected from the carriage when the clamp held against the flanged portion of the barrel is loosened and the syringe is lifted upward

In the center of the base plate and extending transversely of the plate midway between the syringe nozzles is a tubular member which contains the conduits and valve chambers The intake and outlet valves are supported at opposite ends of the member, the valves being common to the two syringes The tubular member is provided with two oppositely extending nipples midway between its ends and in alinement with the nipples on the nozzles of the syringe barrels The nipples of the syringes and those of the conduit chamber are connected by a short length of rubber tubing

In order to prevent reversal of the direction of movement of the plunger-connecting frame without first reversing the adjustment of the intake and discharge valves, thus causing a back flow, means is provided for automatically locking the frame against reversal until the valves are properly adjusted A continuous flow of blood from donor to recipient may be obtained, and accidental back flow is made impossible The machine may be used for aspirating or pumping out abnormal collections of fluid from any of the body cavities, or for pumping in fluid, as in the administration of arsphenamin, especially in outpatient departments where it may be administered uninterruptedly, and for infusions, etc The apparatus has been found to be a time and labor saving device, requiring only one man to operate it It will be noted from the illustration that it is very simple to operate

The length of the apparatus may be reduced by sliding the end plates centrally, underneath the base plate The sliding plates are held in position by a thumb screw The reduction of its length is advantageous in permitting sterilization in a tank of minimum size.

The syringes and apparatus are, of course, sterilized separately The apparatus can easily be cleaned by removing the screws on the under surface of the plug valves, lifting out the valves from their casings and passing a wire through the conduits If, after its use, water followed by alcohol and then by ether is run through it removal of the plug valves from their casings will not be found necessary

ADVANTAGES OF THE MACHINE

1 It is a one man apparatus
2 It provides a continuous flow of blood from donor to recipient, rendering clotting impossible
3 It is a time and labor saving device Large quantities of blood can be quickly transfused and at the same time measured
4 It is absolutely leak-proof
5 It is simple and easy of operation
6 It can be used both for transfusion and for aspirating purposes and when intravenous administration of fluid is indicated

Ritz Chambers

USE OF ADHESIVE PLASTER IN CLOSING ABDOMINAL INCISIONS

J H CARSTENS M D DETROIT

The process of properly suturing the abdominal incision has gone through a long period of evolution but seems now to be about perfect with the exception of the skin suture, regarding which different views are still held Some surgeons use the subcuticular suture bringing the edges of the skin well together and sealing with collodium Sewing through the skin with silkworm gut leads to the danger of carrying *Staphylococcus albus*, always found on the skin, down to the wound, thereby setting up stitch infection In addition, removal of the stitches causes trouble and pain and some patients complain of this Recently clamps have been employed to hold the skin edges together until healing has occurred, when they are removed It has been my practice to close the skin incision with strips of sterilized adhesive plaster, a very simple technic practiced even by the laity in ordinary injuries of the face The abdominal layers are carefully sewed, but never the fat even if it is quite thick, but this is made absolutely dry and all bleeding is arrested The skin is thoroughly cleansed and then washed with alcohol, care being exercised that no alcohol gets into the wound The alcohol removes the fat from the surface of the skin, so that the plaster will adhere Then sterilized zinc oxid plaster, half an inch wide, is cut in lengths of 3 inches, the skin edges are held together with one hand while with the other the plaster strips are applied a quarter of an inch apart, until the whole skin wound is accurately adjusted The hands should not touch the adhesive surface of the plaster as

this will contaminate it Zinc oxid plaster, 2½ inches wide, is then applied around the abdomen, directly on the skin and over the smaller strips of plaster This must go well around the hips Three or four such strips, or as many as are necessary, put snugly around the body will hold the wound edges in apposition in spite of any coughing or vomiting that might take place Ordinarily no further attention is necessary for ten or twelve days when the patient is ready to go home By this time the plaster comes off easily and the patient does not complain, or only slightly It can be soaked with alcohol, but the alcohol hurts more than removing the plaster without it If the operation has been perfectly aseptic, only a small linear scar will be seen If a little stitch abscess should form the plaster can be taken off sooner, or part of it may be removed, but as a rule it is better to keep it on as long as possible For safety s sake fresh plaster is applied when the patient is sent home, this can be removed in from three to four weeks

A trial of this method will demonstrate what a simple thing it is The skin incision can be closed more quickly than by sewing it no matter what suture material is used I have used this method in operations for appendicitis, even if drainage is necessary, in cases of drainage of the gallbladder, and of course in all kinds of pelvic operations In all cases rigid aseptic precautions must be taken

ROENTGENOGRAPHY OF COLLES FRACTURE

SINCLAIR TOUSEY M D NEW YORK

We have all been told that the roentgen ray has shown that many cases of supposed sprain about the wrist were really fractures But it is not so generally known that the normal roentgenographic appearance may be misinterpreted as a fracture of the lower extremity of the radius In a roentgenogram made with the hand and forearm prone on the plate, there is a natural line extending across the radius from the articular surface obliquely upward and radially to a point on the *radial* border of the radius, about an inch above the articular surface Normally no displacement, of course, is visible, but in this position it might be scarcely perceptible anyway And the absence of visible displacement in a lateral roentgenogram causes the diagnosis of a "slight fracture" to be made This mistake can be avoided by making roentgenograms of the two wrists in the same prone position A line

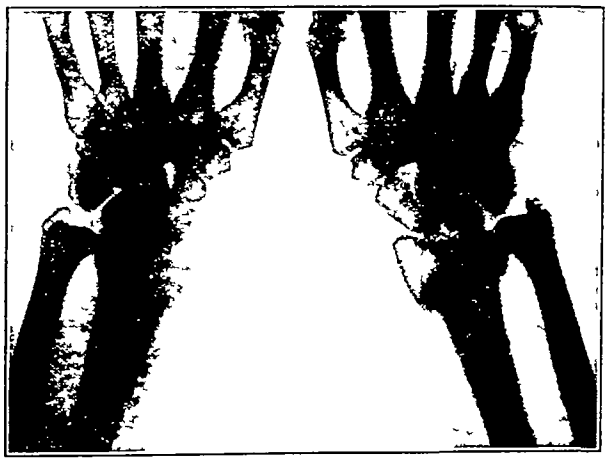

Fig 1—Both wrists prone on plate.

in the injured wrist which is the exact duplicate of a line in the uninjured wrist will not easily be mistaken for a fracture

The technic that I employ involves the making of three roentgenograms each measuring 8 by 10 inches and each including the two wrists in identical positions

The first roentgenogram has already been described. It shows both wrists prone on the plate

The second roentgenogram is a lateral one showing both wrists viewed from such a direction that the dorsal border of the radius and indeed, usually the entire radius is seen free from the image of the ulna

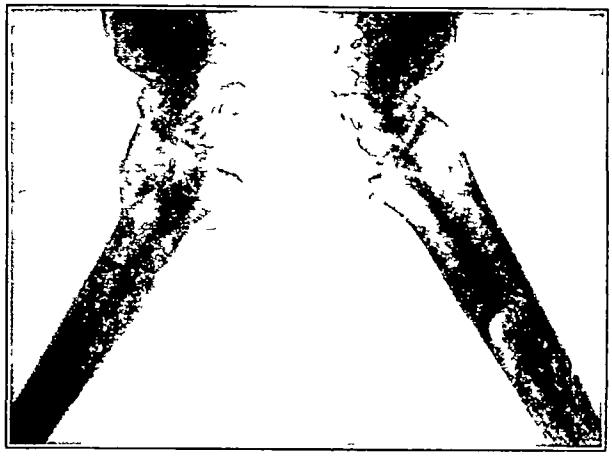

Fig 2—Lateral view dorsal border of radius free from image of ulna

Fig 3—Lateral view palmar border of radius free from image of ulna

The third roentgenogram is a lateral one showing both wrists viewed from such a direction that the palmar border of the radius is seen free from the image of the ulna In this position however the image of a considerable part of the lower extremity of the radius overlaps that of the ulna

In some actual cases of Colles' fracture there is marked deformity which is unmistakable even without the roentgen ray and in such cases all three of these roentgenograms furnish a striking picture of the displacement

In other cases there is a certain amount of deformity persisting after supposed reduction, and if not discovered in time to be successfully treated this forms a permanent disfigurement and a very real disability The case used to illustrate this article was of this type In spite of other surgical and roentgenographic opinions that the fracture had been successfully reduced Dr John M Keyes thought that the deformity and disability required fuller roentgenographic study

The prone roentgenogram would not show any dorsopalmar displacement but it does show slight displacement in what might be called a horizontal plane

The second roentgenogram shows very distinct dorsal displacement or bending dorsally of the lower fragment of the radius with evident impaction or driving of the harder upper fragment into the more cancellous lower fragment The

bending being toward the dorsum is much more clearly shown in this roentgenogram, which shows the dorsal border of the radius, than in the third roentgenogram

The third roentgenogram shows distinctly the palmar border of the radius where, in this case, there is only slight deformity, and the dorsal border is obscured by the shadow of the ulna It is required, however, to obviate the overlooking of any displacement which might in some cases not show so well in the first or second roentgenograms

SYPHILITIC HYPERPLASIA OF PENIS AND SCROTUM

LEON ROSENWALD, M D KANSAS CITY, MO

True elephantiasis does not occur in this part of the world Pseudo-elephantiasis or esthiomene is fairly frequent in the colored race I have seen numerous cases of labial involvement In all of these subjects syphilis is such an important factor that the older terms have been discarded and now "syphilitic hyperplasia" is used to describe the pathologic condition Because of the unusual extent of the process, the subjoined case warrants a report

W T, a colored man, aged 52, admitted to the Kansas City General Hospital (colored division), Nov 5, 1919, a laborer in one of the packing houses, did not remember of having had any of the diseases usual in childhood, but had pneumonia in 1915, and again in 1918 In 1888 he had a primary sclerosis, for which he was treated for about one month He had gonorrhea in 1889 In 1903 he had an acute retention of urine, and the bladder was drained by the perineal route A stricture was also cut at this time The perineal opening never healed, and the patient had been passing most of the urine through the fistulous tract In 1907 he

Anterior and posterior aspects of hyperplastic parts

was struck in the perineum with a brush used for scrubbing cattle The penis and scrotum became enormously swollen, but the swelling subsided without any operative measures Within a short time, however, he noticed that the glans penis had become hard and swollen, with some induration and swelling on the scrotum Gradually this swelling and induration spread over the entire penis and scrotum till about 1915, when the process seemed to come to a standstill From that time on he had not noticed much additional growth

The skin over the penis and scrotum was marked by deep cross furrows, and could easily be taken for elephant's hide The patient refused any treatment We were unable to get tissue for microscopic examination He permitted the pathologist to draw some blood, which proved Wassermann positive

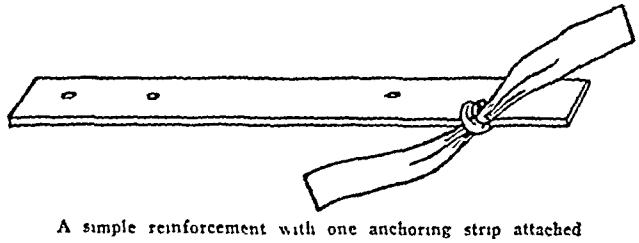
A METHOD FOR SOLIDLY INCORPORATING METAL REINFORCEMENTS IN PLASTER CASTS

WILTON H ROBINSON, M D PITTSBURGH

The advantage of reinforcement with metal strips in certain casts is quite obvious, but unless they are solidly incorporated into the cast, they do not always fulfil the objects for which they are used, which may be thus summarized



A simple reinforcement with one anchoring strip attached

1 To prevent cracking at a strong joint, as spica of the hip 2 To connect two sections of a cast, as the divided cast sometimes used in compound fractures of the leg 3 To help support a heavy part, as abduction cast of the upper arm and shoulder In addition, the jury mast may be mentioned While hardly classed as a reinforcement, it is included because the part incorporated in the plaster may be very advantageously treated as here described

It is not unusual, because of the formation of a plane of cleavage in a cast, for a reinforcement to slip in the folds of the plaster bandage just a little This is especially common in the divided cast of the leg, in which slight rotation of the upper section of the cast in relation to the lower often occurs

This slight slipping of a metal addition to a cast may either make the cast of no value or convert it into a very harmful appliance, but the slipping may be prevented by the method described

The metal to be incorporated, of proper size and strength to meet the indications, is bored, at 1½ to 2 inch intervals, with small holes, through which are threaded 8 inch lengths of muslin bandage which are tied tightly at about their middle When the cast is applied to about one-half the thickness it is to be, the metal, with the attached strips of bandage, is dampened in the water in which the plaster bandages are soaked, some of the plaster cream from the bottom of the pan being rubbed into the meshes of the bandage, it is now laid on the uncompleted cast in as close contact as possible at all points, that is, it should be shaped to the contour either by the hands, bending irons or a vise The application of the plaster bandage is now continued to completion, care being taken to turn ends and corners of the strips of the bandage down and over succeeding layers of plaster bandage so as to obtain the maximum amount of "tangling" between the two, which will make for a more solid anchoring of the metal

Of course, when it is not possible to drill holes in the metal, pieces of bandage may be tightly tied on, and the whole thing incorporated in the same way, though such procedure does not prevent motion in the long axis of a metal strip

AN IMPROVED CONCENTRATION TECHNIC FOR THE DETECTION OF TUBERCLE BACILLI IN SPUTUM*

THEOPHILE RAPHAEL, A.M., M.D., AND NINA ELDRIDGE NEW YORK

The possibility of refinement in routine sputum analysis is of importance, particularly as it affects those handling both frank and suspected cases of tuberculosis. We have investigated the practicability of a technic modification which suggested itself in connection with the concentration procedure reported by Greenfield and Anderson[1] in September, 1919, and, recently, ingeniously adapted to institutional routine by Woolley.[2]

According to the technic of Greenfield and Anderson, 5 c.c. of sputum, to which two volumes of 1 per cent. sodium carbonate in 1 per cent. phenol have been added, are shaken in a centrifuge tube and incubated for from twelve to twenty-four hours. The material is then centrifuged for about fifteen minutes, the supernatant fluid decanted, and smears made from the sediment and specifically stained.

While we were working with this technic with a view to its adoption as a routine measure for Sea View Hospital it occurred to us that greater refinement and marked time saving might possibly be afforded, if a short period of autoclaving was substituted for the comparatively lengthy incubation of the original method. The value of simple autoclaving is well known,[3] and there was no reason to suppose that even better results might not be obtained through the addition of the sodium carbonate-phenol mixture. No original is claimed for this modification, although search of the literature has not disclosed evidence of its previous use.

PROCEDURE

The method of staining employed throughout was essentially the classic Ziehl-Neelsen method, which, for the purpose of greater precision, may thus be given in detail. The slides were steamed in carbolfuchsin for three minutes, decolorized in 5 per cent. acid (hydrochloric) alcohol and 65 per cent. alcohol, and counterstained in an aqueous solution of methylene blue for one minute. They were then washed in tap water and dried.

The slides were examined independently by two observers. At least forty fields were examined in each case before a diagnosis of negative was returned, and, in scoring it was found most practicable to utilize our routine laboratory scale. From 1 to 5 bacilli per slide = (f)ew, from 6 to 15 bacilli per slide = (m)oderate, 16 + bacilli per slide = (n)umerous.

In the first place, to demonstrate the superiority of simple autoclaving (twenty minutes at 15 pounds pressure) over the direct smear method, there were examined thirty-three sputum specimens from patients referred to this hospital as presumably tuberculous, but whose sputums had not been previously examined in this laboratory. Of these thirty-three cases, there were found six in favor of the simple autoclaving method or roughly, for the purpose of gross comparison, a percentage of 18.1.

In the same manner the original Greenfield-Anderson technic was tested against the direct smear procedure with forty similar cases. This test showed a difference of 60 per cent. in favor of the Greenfield-Anderson technic.

On the basis of a series of forty-six similar cases, the suggested autoclave modification of the Greenfield-Anderson technic showed a superiority of 32.5 per cent. against the antiformin method, which in turn, scored 25.5 per cent. better than the direct smear method in forty-seven cases.

The exact technic employed by us in the autoclave modification of the Greenfield-Anderson procedure was as follows. Five c.c. of sputum to which had been added two volumes of 1 per cent. sodium carbonate in 1 per cent. phenol were shaken for ten minutes and then autoclaved for twenty minutes at 15 pounds pressure. Following this the material was centrifuged for ten minutes, the supernatant fluid decanted and smears made and stained from the sediment.

The antiformin procedure employed by us was as follows. The reagent consisted of equal parts of 15 per cent. sodium hydroxid and Labarraque's solution. Five parts of sputum with one part of reagent were shaken for fifteen minutes, incubated for one hour, and then centrifuged for fifteen minutes. The supernatant fluid was decanted and the sediment washed by centrifuging for fifteen minutes with distilled water. Smears were made and stained from the sediment.

In the comparison between the Greenfield-Anderson technic and the suggested modification of that procedure, in order to make the test more rigid only such sputums were employed as had been previously found negative to the simple autoclaving technic which as has been shown was found to be 18.1 per cent. more delicate than the direct smear method. The added rigidity of this routine may be inferred from the fact that out of fifty-three such cases the suggested autoclave modification of the Greenfield-Anderson technic showed a superiority of only 9.4 per cent. over the antiformin procedure as compared to a superiority of 32.5 per cent. in forty-six cases which had not previously been found negative as already mentioned. Fifty-one cases of the latter type were very carefully examined in the manner indicated above both in accordance with the original Greenfield-Anderson procedure and with the suggested autoclave modification. This comparison showed a difference of 2 per cent. in favor of the modification method not including one case which was discarded because of disagreement between the observers although the disagreement was in favor of the modification.

As an example of the hydrocarbon principle in sputum concentration the gasolene method of Krauss and Fleming[4] was investigated. This procedure was not tested very extensively, as, from the outset the technic seemed hardly of sufficient simplicity or practicability to warrant adoption as a routine laboratory procedure particularly for laboratories in which a great number of cases are being handled. However, on the basis of ten not previously determined specimens the direct smear procedure showed a superiority of 30 per cent. over this gasolene technic.

COMMENT

It is evident that the procedure of simple autoclaving is superior to the direct method, although it is not quite so efficient as the antiformin procedure. The suggested autoclave modification of the Greenfield-Anderson technic seems distinctly superior to the antiformin procedure, which may be regarded as generally standard, and which until recently appears to have been about the best of the concentration methods. In addition, however the autoclave modification is much more simple and convenient for laboratory routine the reagent being much more readily prepared and the manipulation minimal. As regards the original Greenfield-Anderson technic, although there is no doubt as to its great efficiency and reliability yet it is obvious that the autoclave modification of this technic is at least as good and indeed on the basis of the actual figures of our test, even somewhat better. In addition, the autoclave modification need consume but fifty minutes at the most while the original procedure requires at least fifteen to twenty four hours an element of considerable importance when time is a factor as it so frequently is particularly with patients coming only for examination and diagnosis. Besides in the modification, there is no doubt as to the sterility of the material while in the original procedure Greenfield and Anderson do not seem to have attained this completely.

SUMMARY

On the basis of our tests it appears that

1. The Greenfield-Anderson incubation technic and the suggested autoclave modification of this procedure are definitely superior to the direct smear, gasolene, simple autoclave and antiformin procedures for the preparation of suspectedly tuberculous sputums.

2. The autoclave modification of the Greenfield-Anderson technic is slightly more delicate than the original method.

3. Further advantages of the autoclave modification over the original technic are (a) great time saving, and (b) assurance of sterility.

CHEMOTHERAPY OF TUBERCULOSIS, WITH PARTICULAR REFERENCE TO THE "CERIUM SALTS TREATMENT"

Directly after his discovery of the tubercle bacillus, Koch made numerous attempts to find chemical agents that might be used to cure tuberculosis,[1] with the tentative assumption that substances which prevent growth of tubercle bacilli in cultures could perhaps exert the same effect on these organisms in the animal body. He found numerous substances that were capable of inhibiting growth of tubercle bacilli in culture mediums to which they had been added in great dilutions, especially a gold cyanid compound, but, not being given to self-deception, he stated that "all these substances remain completely inactive when tested upon the tuberculous animal." His attention was then diverted to the study of tuberculin as a more hopeful agent, and there followed a period of fifteen years during which little was done toward seeking for chemical agents valuable in the treatment of tuberculosis, except for a little inaccurate and valueless work with compounds related to creosote and guaiacol. These substances came to have a widespread reputation as tuberculocidal agents without any one's taking the trouble to ascertain definitely whether they really had any particular capacity to injure tubercle bacilli in the test tube, the tuberculous animal or the consumptive patient, although the German manufacturing chemists did splendid work in providing innumerable derivatives, each with a new copyrighted name and a patented process of manufacture.

With Ehrlich's brilliant achievements, not only with the widely known trypanicidal and antisyphilitic compounds, but also with his careful but less known studies on "semispecific chemical disinfectants,"[2] a new interest arose in the possibility of extending this method of procedure into the field of tuberculosis therapy. Since then numerous substances have been brought forward as cures of tuberculosis under the impressive caption of "chemotherapeutic agents," and with series of a score or a hundred clinical cases in which "favorable results" have been observed. Copper has had a particularly enthusiastic boom. Gräfin von Linden and her followers in Germany projected a "complex lecithin-copper compound" of unannounced composition but of well-advertised manufacture, with the usual favorable clinical results, especially in lupus and localized nonpulmonary lesions, as is generally the case.[3] From the other side of the world, in Tokyo, came another copper cure, the cyanocuprol of Koga, while copper arsphenamin and other copper compounds sprang into the literature until the war turned attention into other channels. It is now eight years since von Linden's copper-lecithin compound made its appearance, but in the tide of German literature that is now beginning to trickle once more toward our shores, we do not notice any considerable number of references to the use of this compound, although much is said about the alarming spread of tuberculosis in the Teutonic countries. Cyanocuprol is still on the market, but the Japanese continue to advance new compounds, sometimes of copper, sometimes of gold and sometimes of neither, for the cure of tuberculosis, so apparently Koga's discovery has not settled the tuberculosis problem in Japan.

The trouble with the chemotherapy of tuberculosis is that it is too difficult, and especially it is too slow. Chemotherapeutic research is built up in slow stages at the best, but the slowness and the difficulty are augmented many times when the tubercle bacillus is the subject. First comes the determining of the capacity of compounds to inhibit growth of the tubercle bacillus in cultures—and the tubercle bacillus is not the easiest of organisms to handle, especially in incompletely equipped laboratories. Then must be determined what the capacity is to kill bacilli, which requires most meticulous technic, and control by inoculating scores or hundreds of guinea-pigs, which must be watched and studied for months or even for a year in each experiment. Then must follow experimental therapeutics on animals, which means daily work with further hundreds of animals, all under the most careful technic and control. Such work as this is by far the most difficult and expensive sort of chemotherapeutic study yet undertaken, requiring not only abundant equipment and resources, but also a cooperating staff of most highly trained bacteriologists, pathologists and chemists, and especially a highly critical direction. It cannot be done by casual investigators in a few months' time with an ordinary laboratory equipment.

We have made this somewhat lengthy statement in lieu of a more extended discussion of recent reports concerning the treatment of tuberculosis by the so-

called cerium earth salts, which, happening to have been taken up by the daily papers, have achieved a notoriety and publicity which is undoubtedly far in excess of the desires of the French physicians who have introduced the procedure Such reports as have been published are at hand,[4] and the sum and substance of the matter seems to be about this A few observations of the inhibitory activity of salts of cerium and some other rare earth metals (especially samarium, neodymium and praseodymium) were made on the growth of tubercle bacilli in cultures, possibly because they are rare substances and had not yet been shown to be valueless in tuberculosis According to the figures given, the inhibitory action of these salts is not at all high, about one to five parts per thousand being required to prevent growth, which may be contrasted with gold chlorid, which inhibits when in dilution of 1 2,000,000, and yet which in the careful studies of DeWitt,[5] as in the earlier observations of Koch, could not be made to show any favorable influence on tuberculosis in animals Innumerable substances have a more powerful inhibitory effect on tubercle bacilli than these rare earth salts Much is made of the reduction of the fat content of the tubercle bacilli grown on mediums containing these salts, the fat being reduced, it is said, from 25 to 40 per cent to 16 to 22 per cent , but we know of no evidence that such variations in fat content have any significant relation to the virulence of the tubercle bacillus for man As far as we can learn, no attempts were made to determine the capacity of the salts of the rare earths to kill tubercle bacilli, and there is no report made of any systematic study of their effects on experimental tuberculosis in animals, in which alone can accurate controls be made We merely have the statement that on the basis of this slight inhibitory effect in cultures, and, what is perhaps more important, a capacity to cause a mononucleosis, a small number of cases of human tuberculosis have been treated with cerium salts by repeated intravenous injections These cases, less than a hundred in the reports published, have now been observed at most a few months, and it is believed that cutaneous, glandular and chronic afebrile tuberculous pulmonary lesions have been improved, and that patients with active pulmonary tuberculosis have been made worse There is no mention of control patients given the same general care without the salts Possibly cerium earth salts help the tuberculous The evidence so far presented, however, is nothing to get excited about Many other agencies, now forgotten, have had as much and more reported in their favor at this stage of their history We cannot find support for the statement of Renon "The results obtained by Grenet and Drouin with the sulphate of the cerium earths are certainly the most scientific yet realized in the chemotherapy of tuberculosis" We find much more support for the closing statement of Paul Lewis' address "Certainly it will be a most unfortunate thing for the progress of tuberculosis research if every substance showing interesting properties in the laboratory is immediately rushed to the clinic regardless of consequences In this situation patience is to be taken more than usually as an evidence of virtue"

FACTORS FACILITATING CIRCULATORY SHOCK

The numerous investigations of circulatory shock have at length made it clear that hemorrhage is not invariably a cause of the condition Under certain circumstances oligemia may arise, even without loss of blood from the body There is a diminution of the volume of blood in effective circulation which has been attributed to a loss of the normal tone of the capillary blood vessels, or to a morbid permeability of the capillary walls A shocklike collapse of the circulation then follows the failure to maintain an effective blood volume or the analogous outcome of a loss of fluid from the vascular system

The development of circulatory shock without actual bleeding has been demonstrated after extensive injury to tissues, especially to muscle The recent evidence indicates that in this condition, sometimes denoted "secondary wound shock," an aseptic traumatic toxemia may occur, owing to the absorption of substances produced by the injury or liberated in the subsequent autolysis of the tissues involved Thus, during the war Bayliss and Cannon demonstrated that when the thigh muscles of an animal were crushed under anesthesia a progressive fall of blood pressure with other symptoms of shock developed If the blood vessels to the leg were clamped during the injury, the shock effect did not ensue until the clamps were removed Bayliss[1] has insisted on this account that the circulatory collapse was due to the absorption of some toxic substance produced in the injured cells He believes that this conclusion was confirmed by the fact that massage of the injured parts brought about an increase in the rate of fall of the blood pressure The latter result is of interest in view of the clinical experience of the importance of keeping injured limbs as immobile as possible, especially when fractured Surgeons have found that application of a tourniquet centrally to the injured part is followed by marked improvement Similar results have been obtained by rapid excision of the damaged tissues

It was a decided advantage for the investigation of circulatory shock when Dale, Richards and Laid-

1 Bayliss W M The Action of C Circ... J Pharmacol & Exper Therap 15

law[2] found that a condition decidedly similar to it could be produced by the administration of histamin in suitable doses Apparently it produces throughout the whole circulatory system a group of phenomena which are recognized as inflammation when they occur locally Although it is easily conceivable that histamin might arise from the amino-acid histidin, which is an integral complex of the tissue proteins, there is no proof that histamin is in fact the substance responsible for the capillary damage and altered permeability in traumatic toxemia For the present it represents merely a convenient agent for the experimental production of shock through chemical influence on the blood vessels Dale[3] has been further enabled by it to study what influences may have an adjuvant effect in the genesis of shock following traumatic toxemia Exhaustion, pain, cold, thirst, hemorrhage and anesthetics have all been alleged to play some part in the incidence of the circulatory collapse Dale has correspondingly found that some of these factors which are suitable for experimental investigation actually lower in a striking degree the normal resistance to the poisonous histamin This is particularly true of a large but not in itself serious hemorrhage It is likewise true of anesthetics like ether, in contrast with nitrous oxid and oxygen Dale regards it as probable that the resistance of the otherwise perfectly healthy subject to products of tissue injury would similarly be high, and it is reasonable to attribute the demonstrated danger of chloroform or ether to the severely wounded man, and the relative safety of nitrous oxid, to the much greater effect of the former anesthetics, as shown in these experiments, in depressing the normal resistance to this type of toxemia Furthermore, it seems possible to Dale that the greater safety in civilian operations, shown by Crile and others, of the combination of local anesthesia with nitrous oxid and oxygen, as compared with prolonged anesthesia with ether or chloroform, may find its true explanation along the same lines Hence Dale thinks that in cases in which bacterial or other toxemia is present, chloroform and ether should be avoided whenever possible

If we regard the shock produced in operations as attributable to a combination of such factors as toxemia from injured tissues, hemorrhage and anesthetics, it is interesting to learn that the solution of gum acacia in saline as advocated by Bayliss[4] in particular gives promise of combating many of the difficulties encountered It has no chemical or drug-like action and can be used in large quantities, and owing to the osmotic pressure of the colloid gum, which cannot readily escape from the blood vessels, fluid which would otherwise disappear is retained within the blood vessels In the words of Bayliss[1] the gum-saline solutions can be used with benefit when the blood volume is reduced, owing to removal of a part from effective circulation by stagnation in the capillaries, as happens in wound shock, traumatic toxemia, and probably in other similar conditions In such cases, its primary object is to maintain a normal circulation until the toxic products are eliminated from the blood, while the blood out of circulation is restored to use When fluid has escaped from the blood, owing to capillaries becoming permeable to colloids, as in the action of tissue toxins, gum-saline restores the normal state, provided the morbid condition has not lasted too long In the latter case, even transfusion of blood is of no avail

SCIENCE IN THE MEDICAL CLINIC

The possibility of making accurate observations at the bedside on the basal metabolism of patients represents a distinct step in the direction of progress in clinical medicine To one who has followed many of the "crudely unscientific" performances in the consideration of alleged disorders of the endocrine glands, the institution of precise diagnostic measurements and analyses in place of the guesswork of former years is truly significant The usefulness of scientifically dependable estimations of bodily functions looms up large Only a short time ago a distinguished physiologist felt justified in remarking ironically that when several unknown factors may be interacting, as happens in the study of the internal secretions, it is pleasant to give the fancy full play, and this is also a perfectly harmless occupation provided such mental activity does not develop into hallucination[1] Four years ago, Du Bois' review[2] of the few carefully investigated cases of the metabolism in thyroid disease revealed the possibilities in the way of more exact differentiation between true hyperthyroidism, hypothyroidism, and ill defined disorders exhibiting related symptoms The stimulation or depression of metabolism has become open to more precise clinical interpretation A knowledge of the basal metabolism rate in each patient has acquired a unique value in thyroid disorder because, to quote a recent writer, it gives a very accurate mathematical index of the degree of functional activity of the gland

Among the hospitals in which the determination of basal metabolism in suitable cases has now become a routine procedure, the Mayo Clinic has afforded the largest number of records of its possible usefulness

1 Lusk Graham The Science of Nutrition Philadelphia W B Saunders Company, 1917 p 439

2 Du Bois E F Metabolism in Exophthalmic Goiter Arch Int. Med 17 915 (June) 1916

in thyroid disease In a summary of the observations on several hundreds of patients, published by Sandiford,[3] the success of types of remedial treatment for exophthalmic goiter is evaluated by measurements of basal metabolic rates In 182 cases before any treatment was instituted, the average rate was 51 per cent above normal, with an average pulse rate of 115 A week's complete rest reduced the rates in selected cases to + 46 per cent and 108, respectively The results of single and multiple ligations could be similarly ascertained and the most advisable steps in treatment pursued on the basis of accurate data In myxedema the metabolic rate may fall to 40 per cent below normal As there are few known disorders in which constant and distinct variations from the normal in the basal metabolic rate have been demonstrated, the significance of the findings in thyroid disorders becomes accentuated The differential diagnosis of neuroses simulating hyperthyroidism or hypothyroidism becomes more easily possible because no definite instance of an altered rate has been found in that group of cases designated as neurasthenia or chronic nervous exhaustion The clinical application of the estimation of the rate of basal metabolism is a direct outcome of the work of the scientific laboratory, and yet there still are those who speak contemptuously of the value of laboratory investigations in what they delight to call "practical medicine '

HAMSTRINGING THE FOOD AND DRUGS ACT

During the last few years the people of the United States have been given a very material amount of protection against those swindlers who sophisticate the foodstuffs and drug supplies of the country Especially good work has been done in obtaining convictions against "patent medicine" fakers who have made false and fraudulent claims for their nostrums This protection has been given through the enforcement of the federal Food and Drugs Act The administration of this law rests with the Department of Agriculture, which, acting through its Bureau of Chemistry, collects evidence and lays the groundwork for the legal machinery of the government to proceed against the offender The activity of the Bureau of Chemistry of the Department of Agriculture has, of course, aroused the strongest antagonism on the part of the nostrum interests These interests may well rejoice in the recent action of Congress in cutting down the appropriations for the Department of Agriculture Even under the appropriation given for the last fiscal year, which ended June 30, 1920, the department was greatly hampered in its work of enforcing the Food and Drugs Act Under the plea of economy, Congress has reduced the appropriation for the enforcement of this act by thirty thousand dollars The *Oil, Paint and Drug Reporter*, a high-grade and conservative publication, well states the fact, in commenting on this disgraceful condition of affairs, when it says

> Under the reduced amount provided for next year, it will be impossible to supervise the regulation of the Food and Drugs Act as it should be supervised This portends a rich harvest for those who misbrand and adulterate medicinal, pharmaceutical, disinfectant and other preparations The vast public, which daily purchases and consumes these products, will be the chief sufferer At a time when the act requires enforcement of the most rigorous nature the Congress has succeeded in hamstringing it

At a time, then, when in all lines of industry the spirit of exploitation is rife, Congress, under the specious plea of economy, practically nullifies the protective power of one of the most useful pieces of federal legislation ever enacted

THE NEWER QUACKERY

The large auditorium is filled with beautifully gowned women There is a subdued hum of chatter and light laughter Silently the magnificent maroon velour curtains are parted, as though by some invisible genii The lights become dim Then there walks—almost glides—on the stage a man faultlessly attired, his lustrous hair brushed back from a pallid countenance The audience is hushed He begins to speak in sympathetic tones pouring forth well rounded but meaningless phrases about the perfection of ideality, happiness through the sacrifice of the excentric ego, the attainment to Nirvana through immolation on the pyre of ideal scientific introspection He promises youth and health to those who will believe and study And the audience—women, occupiers of one room kitchenettes, suffering with the ennui of idleness, faces elaborated with artifices in attempt to simulate the long lost buoyancy of youth—sigh happily as they dream of the mirage he brings up before them Quiet ushers pass along the aisles, and with sibilant whispers distribute cards on which arrangements may be made for personal consultation with the "professor" Thus works the newer quackery—health and happiness through commercialized psychology

THE HOSPITAL LIBRARY

> *To the Editor* —Will you kindly send us a list of books, with approximate cost necessary to furnish an up to date library for our interns? SUPT

This query, from the superintendent of a large hospital, using a considerable number of interns, is not the first request for such information that has been received It is a practical, timely problem, and THE JOURNAL will be glad to help in its solution Hence, suggestions are asked for such a library Different institutions will have different requirements some will be able to buy only fifty books, others more, some possibly a less number Let the suggestions cover thirty, fifty, seventy-five and one hundred books Naturally those who are kind enough to make

3 Sandiford Irene The Basal Metabolic Rate in Exophthalmic Goiter (1 917 Cases) with a Brief Description of the Technic Used at the Mayo Clinic Endocrinology 4 71 (Jan. March) 1920 Boothby W M and Sandiford Irene Technic of Basal Metabolism Rate Determinations Philadelphia W B Saunders Company 1920

the trouble to respond will give the matter careful thought before making the selection Institutions having satisfactory libraries can help by sending us a list of books that they have found most desirable It may be that it will be possible to tabulate the replies in such a way that the composite information will be of advantage to many institutions as well as to young physicians who are beginning practice

THE EASIEST WAY

A gynecologist was speaking "No," he said, "I haven't taken out a permit In twenty years of practice I have yet to find a case in which I could be sure whisky was beneficial Not having a permit makes it easy for me to turn down requests from my intimate friends and patients" Then the opinions of a well-known internist, a pediatrician, a surgeon, and some general practitioners were sought None of them, with the exception of one of the latter, had taken out a permit He had given ten prescriptions in three months, and he admitted—not for publication—that in nine instances the prescription was written at the patient's request, and in the tenth something else would have served Don't subject yourself to temptation, don't hurt the feelings of your patient or of a very particular friend by refusing to write a "prescription" when he pleads for one Have a good excuse for not doing so The easiest way is not to have a "permit," much less a book of blank prescriptions

WHAT CONSTITUTES AN OVERSUPPLY OF PHYSICIANS

Our Berlin letter this week is devoted largely to a discussion of conditions in the medical profession in Germany Incidentally, it is claimed by our correspondent that the medical profession is seriously overcrowded, statistics are quoted to show there is one physician for every 1,920 persons In reading this, one is led to wonder how our correspondent would regard conditions in this country, where there is one physician to less than 750 population

Medical Journals Facing Crisis—The *Policlinico* of Rome states that in Italy all the medical journals are encountering serious difficulties from the scarcity and high price of paper and of labor, etc Some of the journals have had to merge and others have raised their subscription price A conference of editors and publishers of scientific and other journals was held recently at Rome, and a group of physician members of the national legislature have appealed to the minister of public instruction on behalf of the medical journals In France, the *Presse medicale* and some of the other medical journals have raised their price The *Presse medicale* is now 40 francs, instead of 25 francs as last year In Belgium, the two leading medical weeklies are now published by the same firm, to save expense The *Semana médica* of Buenos Aires has also announced that its subscription price is to be raised and in Germany the four leading medical weeklies have also raised their prices Subscription to the *Deutsche medizinische Wochenschrift*, for example, which was in Germany 24 marks in 1915 and 34 in 1919 is now 80 marks For foreign countries the subscription was 32 marks in 1915 and 42 marks in 1919, but is now stated for the United States to be $5 (plus postage) The price for different countries varies with the rate of exchange at present

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION PUBLIC HEALTH ETC)
